Every Hour, Every Day.

Every hour, every day, you're out there: healing, helping, working to the limit.

Other people have jobs, or careers, but you have a responsibility that doesn't end at the end of the day — that never really ends.

To prepare for that responsibility, you studied longer, trained harder and sacrificed more than most people could even understand.

And now, to each patient you bring all of those years of training and work. Each time, with each case, you bring all of your intelligence, you bring your desire to help, and you bring the special blend of experience and understanding that your patients rely on.

Few people can understand the pressures you're under — or the thought you carry with you.

As your company — owned by physicians, for physicians in Maryland — all of us at Medical Mutual want you to know that we appreciate what you do. Carefully, quietly, behind the scene, we do our jobs so you can be free, every hour, every day, to do the most important work there is.

From Our Point of View

A picture is worth a thousand words, particularly when describing the complexity of the human body. Which is why our imaging services are so valuable to you and your patients.

Our dedicated radiologists and staff provide the care and experience you expect. And we are able to schedule your patients within 24 hours of their request at our convenient location on the campus of GBMC.

At Magnetic Imaging of Baltimore, we realize the importance of getting you the full story, clearly and quickly.

You need help with your insurance billing, but some companies want you to buy thousands of dollars of their proprietary software and hardware? Can't afford it?

There is a better way. We don't ask you to purchase anything and don't want you to change your existing accounting practices. Different concept, but worth looking into? You bet. And you get state-of-the-art electronic claims processing to boot.

Effective cholesterol control

Consistently and significantly reduces total C and atherogenic LDL-C; positively affects other key lipids

*Each arrow represents a range of means derived from a single placebo-controlled study that included 55 patients treated with pravastatin.

PRAVACHOL® (pravastatin sodium) is indicated as an adjunct to diet for the reduction of elevated total and LDL-cholesterol levels in patients with primary hypercholesterolemia (Types IIa and IIb) when the response to diet alone has not been adequate.

Active liver disease *or* unexplained transaminase elevations, pregnancy and lactation are contraindications to the use of pravastatin.

Reference: 1. Jones PH, et al. Once-daily pravastatin in patients with primary hypercholesterolemia: a dose-response study. *Clin Cardiol.* 1991;14:146-151.

PRAVACHOL™

pravastatin sodium 20 mg tablets

Please see CONTRAINDICATIONS, WARNINGS, PRECAUTIONS, and ADVERSE REACTIONS in the brief summary of prescribing information on the adjacent page.

Bristol-Myers Squibb Company

PRAVACHOL® (Pravastatin Sodium Tablets)

CONTRAINDICATIONS

Hypersensitivity to any component of this medication.

Active liver disease or unexplained, persistent elevations in liver function tests (see WARNINGS).

Pregnancy and lactation. Atherosclerosis is a chronic process and discontinuation of lipid-lowering drugs during pregnancy should have little impact on the outcome of long-term therapy of primary hypercholesterolemia. Cholesterol and other products of cholesterol biosynthesis are essential components for fetal development (including synthesis of steroids and cell membranes). Since HMG-CoA reductase inhibitors decrease cholesterol synthesis and possibly the synthesis of other biologically active substances derived from cholesterol, they may cause fetal harm when administered to pregnant women. Therefore, HMG-CoA reductase inhibitors are contraindicated during pregnancy and in nursing mothers. **Pravastatin should be administered to women of childbearing age only when such patients are highly unlikely to conceive and have been informed of the potential hazards.** If the patient becomes pregnant while taking this class of drug, therapy should be discontinued and the patient apprised of the potential hazard to the fetus.

WARNINGS

Liver Enzymes: HMG-CoA reductase inhibitors, like some other lipid-lowering therapies, have been associated with biochemical abnormalities of liver function. Increases of serum transaminase (ALT, AST) values to more than 3 times the upper limit of normal occurring on 2 or more (not necessarily sequential) occasions have been reported in 1.3% of patients treated with pravastatin in the U.S. over an average period of 18 months. These abnormalities were not associated with cholestasis and did not appear to be related to treatment duration. In those patients in whom these abnormalities were believed to be related to pravastatin and who were discontinued from therapy, the transaminase levels usually fell slowly to pretreatment levels. These biochemical findings are usually asymptomatic although worldwide experience indicates that anorexia, weakness, and/or abdominal pain may also be present in rare patients.

As with other lipid-lowering agents, liver function tests should be performed during therapy with pravastatin. Serum aminotransferases, including ALT (SGPT), should be monitored before treatment begins, every six weeks for the first three months, every eight weeks during the remainder of the first year, and periodically thereafter (e.g., at about six-month intervals). Special attention should be given to patients who develop increased transaminase levels. Liver function tests should be repeated to confirm an elevation and subsequently monitored at more frequent intervals. If increases in AST and ALT equal or exceed three times the upper limit of normal and persist, then therapy should be discontinued. Persistence of significant aminotransferase elevations following discontinuation of therapy may warrant consideration of liver biopsy.

Active liver disease or unexplained transaminase elevations are contraindications to the use of pravastatin (see CONTRAINDICATIONS). Caution should be exercised when pravastatin is administered to patients with a history of liver disease or heavy alcohol ingestion (see CLINICAL PHARMACOLOGY: Pharmacokinetics/Metabolism). Such patients should be closely monitored, started at the lower end of the recommended dosing range, and titrated to the desired therapeutic effect.

Skeletal Muscle: Rhabdomyolysis with renal dysfunction secondary to myoglobinuria has been reported with pravastatin and other drugs in this class. Uncomplicated myalgia has also been reported in pravastatin-treated patients (see ADVERSE REACTIONS). Myopathy, defined as muscle aching or muscle weakness in conjunction with increases in creatine phosphokinase (CPK) values to greater than 10 times the upper limit of normal was reported to be possibly due to pravastatin in only one patient in clinical trials (<0.1%). Myopathy should be considered in any patient with diffuse myalgias, muscle tenderness or weakness, and/or marked elevation of CPK. Patients should be advised to report promptly unexplained muscle pain, tenderness or weakness, particularly if accompanied by malaise or fever. **Pravastatin therapy should be discontinued if markedly elevated CPK levels occur or myopathy is diagnosed or suspected. Pravastatin therapy should also be temporarily withheld in any patient experiencing an acute or serious condition predisposing to the development of renal failure secondary to rhabdomyolysis, e.g., sepsis; hypotension; major surgery; trauma; severe metabolic, endocrine, or electrolyte disorders; or uncontrolled epilepsy.**

The risk of myopathy during treatment with lovastatin is increased if therapy with either cyclosporine, gemfibrozil, erythromycin, or niacin is administered concurrently. There is no experience with the use of pravastatin together with cyclosporine. Myopathy has not been observed in clinical trials involving small numbers of patients who were treated with pravastatin together with niacin. One trial of limited size involving combined therapy with pravastatin and gemfibrozil showed a trend toward more frequent CPK elevations and patient withdrawals due to musculoskeletal symptoms in the group receiving combined treatment as compared with the groups receiving placebo, gemfibrozil, or pravastatin monotherapy. Myopathy was not reported in this trial (see PRECAUTIONS: Drug Interactions). One patient developed myopathy when clofibrate was added to a previously well tolerated regimen of pravastatin; the myopathy resolved when clofibrate therapy was stopped and pravastatin treatment continued. **The use of fibrates alone may occasionally be associated with myopathy. The combined use of pravastatin and fibrates should generally be avoided.**

PRECAUTIONS

General: Pravastatin may elevate creatine phosphokinase and transaminase levels (see ADVERSE REACTIONS). This should be considered in the differential diagnosis of chest pain in a patient on therapy with pravastatin.

Homozygous Familial Hypercholesterolemia. Pravastatin has not been evaluated in patients with rare homozygous familial hypercholesterolemia. In this group of patients, it has been reported that HMG-CoA reductase inhibitors are less effective because the patients lack functional LDL receptors.

Renal Insufficiency. A single 20 mg oral dose of pravastatin was administered to 24 patients with varying degrees of renal impairment (as determined by creatinine clearance). No effect was observed on the pharmacokinetics of pravastatin or its 3α-hydroxy isomeric metabolite (SQ 31,906). A small increase was seen in mean AUC values and half-life ($t_{1/2}$) for the inactive enzymatic ring hydroxylation metabolite (SQ 31,945). Given this small sample size, the dosage administered, and the degree of individual variability, patients with renal impairment who are receiving pravastatin should be closely monitored.

Information for Patients: Patients should be advised to report promptly unexplained muscle pain, tenderness or weakness, particularly if accompanied by malaise or fever.

Drug Interactions: *Immunosuppressive Drugs, Gemfibrozil, Niacin (Nicotinic Acid), Erythromycin:* See WARNINGS: Skeletal Muscle.

Antipyrine: Clearance by the cytochrome P450 system was unaltered by concomitant administration of pravastatin. Since pravastatin does not appear to induce hepatic drug-metabolizing enzymes, it is not expected that any significant interaction of pravastatin with other drugs (e.g., phenytoin, quinidine) metabolized by the cytochrome P450 system will occur.

Cholestyramine/Colestipol: Concomitant administration resulted in an approximately 40 to 50% decrease in the mean AUC of pravastatin. However, when pravastatin was administered 1 hour before or 4 hours after cholestyramine or 1 hour before colestipol and a standard meal, there was no clinically significant decrease in bioavailability or therapeutic effect. (See DOSAGE AND ADMINISTRATION: Concomitant Therapy.)

Warfarin: In a study involving 10 healthy male subjects given pravastatin and warfarin concomitantly for 6 days, bioavailability parameters at steady state for pravastatin (parent compound) were not altered. Pravastatin did not alter the plasma protein-binding of warfarin. Concomitant dosing did increase the AUC and Cmax of warfarin but did not produce any changes in its anticoagulant action (i.e., no increase was seen in mean prothrombin time after 6 days of concomitant therapy). However, bleeding and extreme prolongation of prothrombin time has been reported with another drug in this class. Patients receiving warfarin-type anticoagulants should have their prothrombin times closely monitored when pravastatin is initiated or the dosage of pravastatin is changed.

Cimetidine: The $AUC_{0\text{-}12hr}$ for pravastatin when given with cimetidine was not significantly different from the AUC for pravastatin when given alone. A significant difference was observed between the AUC's for pravastatin when given with cimetidine compared to when administered with antacid.

Digoxin: In a crossover trial involving 18 healthy male subjects given pravastatin and digoxin concurrently for 9 days, the bioavailability parameters of digoxin were not affected. The AUC of pravastatin tended to increase, but the overall bioavailability of pravastatin plus its metabolites SQ 31,906 and SQ 31,945 was not altered.

Gemfibrozil: In a crossover study in 20 healthy male volunteers given concomitant single doses of pravastatin and gemfibrozil, there was a significant decrease in urinary excretion and protein binding of pravastatin. In addition, there was a significant increase in AUC, Cmax, and Tmax for the pravastatin metabolite SQ 31,906. Combination therapy with pravastatin and gemfibrozil is generally not recommended.

In interaction studies with *aspirin, antacids* (1 hour prior to PRAVACHOL), *cimetidine, nicotinic acid, or probucol,* no statistically significant differences in bioavailability were seen when PRAVACHOL (pravastatin sodium) was administered.

Other Drugs: During clinical trials, no noticeable drug interactions were reported when PRAVACHOL was added to: diuretics, antihypertensives, digitalis, converting-enzyme inhibitors, calcium channel blockers, beta-blockers, or nitroglycerin.

Endocrine Function: HMG-CoA reductase inhibitors interfere with cholesterol synthesis and lower circulating cholesterol levels and, as such, might theoretically blunt adrenal or gonadal steroid hormone production. Results of clinical trials with pravastatin in males and post-menopausal females were inconsistent with regard to possible effects of the drug on basal steroid hormone levels. In a study of 21 males, the mean testosterone response to human chorionic gonadotropin was significantly reduced ($p<0.004$) after 16 weeks of treatment with 40 mg of pravastatin. However, the percentage of patients showing a ≥50% rise in plasma testosterone after human chorionic gonadotropin stimulation did not change significantly after therapy in these patients. The effects of HMG-CoA reductase inhibitors on spermatogenesis and fertility have not been studied in adequate numbers of patients. The effects, if any, of pravastatin on the pituitary-gonadal axis in pre-menopausal females are unknown. Patients treated with pravastatin who display clinical evidence of endocrine dysfunction should be evaluated appropriately. Caution should also be exercised if an HMG-CoA reductase inhibitor or other agent used to lower cholesterol levels is administered to patients also receiving other drugs (e.g., ketoconazole, spironolactone, cimetidine) that may diminish the levels or activity of steroid hormones.

CNS Toxicity: CNS vascular lesions, characterized by perivascular hemorrhage and edema and mononuclear cell infiltration of perivascular spaces, were seen in dogs treated with pravastatin at a dose of 25 mg/kg/day, a dose that produced a plasma drug level about 50 times higher than the mean drug level in humans taking 40 mg/day. Similar CNS vascular lesions have been observed with several other drugs in this class.

A chemically similar drug in this class produced optic nerve degeneration (Wallerian degeneration of retinogeniculate fibers) in clinically normal dogs in a dose-dependent fashion starting at 60 mg/kg/day, a dose that produced mean plasma drug levels about 30 times higher than the mean drug level in humans taking the highest recommended dose (as measured by total enzyme inhibitory activity). This same drug also produced vestibulocochlear Wallerian-like degeneration and retinal ganglion cell chromatolysis in dogs treated for 14 weeks at 180 mg/kg/day, a dose which resulted in a mean plasma drug level similar to that seen with the 60 mg/kg dose.

Carcinogenesis, Mutagenesis, Impairment of Fertility: In a 2-year study in rats fed pravastatin at doses of 10, 30, or 100 mg/kg body weight, there was an increased incidence of hepatocellular carcinomas in males at the highest dose ($p<0.01$). Although rats were given up to 125 times the human dose (HD) on a mg/kg body weight basis, their serum drug levels were only 6 to 10 times higher than those measured in humans given 40 mg pravastatin as measured by AUC.

The oral administration of 10, 30, or 100 mg/kg (producing plasma drug levels approximately 0.5 to 5.0 times human drug levels at 40 mg) of pravastatin to mice for 22 months resulted in a statistically significant increase in the incidence of malignant lymphomas in treated females when all treatment groups were pooled and compared to controls ($p<0.05$). The incidence was not dose-related and male mice were not affected.

A chemically similar drug in this class was administered to mice for 72 weeks at 25, 100, and 400 mg/kg body weight, which resulted in mean serum drug levels approximately 3, 15, and 33 times higher than the mean human serum drug concentration (as total inhibitory activity) after a 40 mg oral dose. Liver carcinomas were significantly increased in high-dose females and mid- and high-dose males, with a maximum incidence of 90 percent in males. The incidence of adenomas of the liver was significantly increased in mid- and high-dose females. Drug treatment also significantly increased the incidence of lung adenomas in mid- and high-dose males and females. Adenomas of the eye Harderian gland (a gland of the eye of rodents) were significantly higher in high-dose mice than in controls.

No evidence of mutagenicity was observed *in vitro*, with or without rat-liver metabolic activation, in the following studies: microbial mutagen tests, using mutant strains of *Salmonella typhimurium* or *Escherichia coli*; a forward mutation assay in L5178Y TK +/− mouse lymphoma cells; a chromosomal aberration test in hamster cells; and a gene conversion assay using *Saccharomyces cerevisiae*. In addition, there was no evidence of mutagenicity in either a dominant lethal test in mice or a micronucleus test in mice.

In a study in rats, with daily doses up to 500 mg/kg, pravastatin did not produce any adverse effects on fertility or general reproductive performance. However, in a study with another HMG-CoA reductase inhibitor, there was decreased fertility in male rats treated for 34 weeks at 25 mg/kg body weight, although this effect was not observed in a subsequent fertility study when this same dose was administered for 11 weeks (the entire cycle of spermatogenesis, including epididymal maturation). In rats treated with this same reductase inhibitor at 180 mg/kg/day, seminiferous tubule degeneration (necrosis and loss of spermatogenic epithelium) was observed. Although not seen with pravastatin, two similar drugs in this class caused drug-related testicular atrophy, decreased spermatogenesis, spermatocytic degeneration, and giant cell formation in dogs. The clinical significance of these findings is unclear.

Pregnancy: Pregnancy Category X: See CONTRAINDICATIONS.

Safety in pregnant women has not been established. Pravastatin was not teratogenic in rats at doses up to 1000 mg/kg daily or in rabbits at doses of up to 50 mg/kg daily. These doses resulted in 20x (rabbit) or 240x (rat) the human exposure based on surface area (mg/meter^2). However, in studies with another HMG-CoA reductase inhibitor, skeletal malformations were observed in rats and mice. PRAVACHOL (pravastatin sodium) should be administered to women of child-bearing potential only when such patients are highly unlikely to conceive and have been informed of the potential hazards. If the woman becomes pregnant while taking PRAVACHOL (pravastatin sodium), it should be discontinued and the patient advised again as to the potential hazards to the fetus.

Nursing Mothers: A small amount of pravastatin is excreted in human breast milk. Because of the potential for serious adverse reactions in nursing infants, women taking PRAVACHOL should not nurse (see CONTRAINDICATIONS).

Pediatric Use: Safety and effectiveness in individuals less than 18 years old have not been established. Hence, treatment in patients less than 18 years old is not recommended at this time. (See also PRECAUTIONS: **General**.)

ADVERSE REACTIONS

Pravastatin is generally well tolerated; adverse reactions have usually been mild and transient. In 4-month long placebo-controlled trials, 1.7% of pravastatin-treated patients and 1.2% of placebo-treated patients were discontinued from treatment because of adverse experiences attributed to study drug therapy; this difference was not statistically significant. In long-term studies, the most common reasons for discontinuation were asymptomatic serum transaminase increases and mild, non-specific gastrointestinal complaints. During clinical trials the overall incidence of adverse events in the elderly was not different from the incidence observed in younger patients.

Adverse Clinical Events: All adverse clinical events (regardless of attribution) reported in more than 2% of pravastatin-treated patients in the placebo-controlled trials are identified in the table below, also shown are the percentages of patients in whom these medical events were believed to be related or possibly related to the drug:

	All Events %		Events Attributed to Study Drug %	
Body System/Event	Pravastatin (N = 900)	Placebo (N = 411)	Pravastatin (N = 900)	Placebo (N = 411)

*Statistically significantly different from placebo.

The following effects have been reported with drugs in this class:

Skeletal: myopathy, rhabdomyolysis.

Neurological: dysfunction of certain cranial nerves (including alteration of taste, impairment of extra-ocular movement, facial paresis), tremor, vertigo, memory loss, paresthesia, peripheral neuropathy, peripheral nerve palsy.

Hypersensitivity Reactions: An apparent hypersensitivity syndrome has been reported rarely which has included one or more of the following features: anaphylaxis, angioedema, lupus erythematous-like syndrome, polymyalgia rheumatica, vasculitis, purpura, thrombocytopenia, leukopenia, hemolytic anemia, positive ANA, ESR increase, arthritis, arthralgia, urticaria, asthenia, photosensitivity, fever, chills, flushing, malaise, dyspnea, toxic epidermal necrolysis, erythema multiforme, including Stevens-Johnson syndrome.

Gastrointestinal: pancreatitis, hepatitis, including chronic active hepatitis, cholestatic jaundice, fatty change in liver, and, rarely, cirrhosis, fulminant hepatic necrosis, and hepatoma; anorexia, vomiting.

Reproductive: gynecomastia, loss of libido, erectile dysfunction.

Eye: progression of cataracts (lens opacities), ophthalmoplegia.

Laboratory Test Abnormalities: Increases in serum transaminase (ALT, AST) values and CPK have been observed (see WARNINGS).

Transient, asymptomatic eosinophilia has been reported. Eosinophil counts usually returned to normal despite continued therapy. Anemia, thrombocytopenia, and leukopenia have been reported with other HMG-CoA reductase inhibitors.

Concomitant Therapy: Pravastatin has been administered concurrently with cholestyramine, colestipol, nicotinic acid, probucol and gemfibrozil. Preliminary data suggest that the addition of either probucol or gemfibrozil to therapy with lovastatin or pravastatin is **not** associated with greater reduction in LDL-cholesterol than that achieved with lovastatin or pravastatin alone. No adverse reactions unique to the combination or in addition to those previously reported for each drug alone have been reported. Myopathy and rhabdomyolysis (with or without acute renal failure) have been reported when another HMG-CoA reductase inhibitor was used in combination with immunosuppressive drugs, gemfibrozil, erythromycin, or lipid-lowering doses of nicotinic acid. Concomitant therapy with HMG-CoA reductase inhibitors and these agents is generally not recommended. (See WARNINGS: **Skeletal Muscle** and PRECAUTIONS: **Drug Interactions.**)

OVERDOSAGE

There have been no reports of overdoses with pravastatin.

Should an accidental overdose occur, treat symptomatically and institute supportive measures as required.

Executive Director's Newsletter

Joseph J. Harrison III, Comptroller/Associate Executive Director for Med Chi, dies at 63

On Saturday, January 16, 1993, Joe Harrison, who had worked for Med Chi for over 30 years, died after an apparent heart attack at his home in Ellicott City, Maryland. Mr. Harrison was chief financial officer of Med Chi, treasurer of the Maryland Medical Political Action Committee, and manager of various for-profit insurance activities under the separately held Med Chi Agency.

Committee Selection Cards 1993-1994

Med Chi members interested in serving on a Med Chi committee during the 1993-94 committee year should complete the committee selection card following this newsletter. All members must complete this card to be considered for appointment.

Donald "Ted" Lewers, M.D. — Candidate for AMA Board of Trustees

Med Chi past president, Donald "Ted" Lewers, M.D., has announced his candidacy for election to the AMA Board of Trustees. Dr. Lewers chairs the AMA Council on Legislation on which he has served for over five years. He sits on the AMA Technical Advisory Committee on Health System Reform and represents the AMA on the RBRVS update committee. While chair of the AMA ad hoc CLIA Committee, he worked behind the scenes with HCFA and the CDC to help obtain the extensions for and modifications of the CLIA regulations. Dr. Lewers is highly regarded for testifying for the AMA before Congress and the National Governor's Conference on several occasions. He is the seasoned leader we need to lead America's physicians. Contact your out-of-state colleagues and ask them to call their AMA delegation and express their support of Dr. Lewers' candidacy.

Annual Meeting — Registration and Room Reservations

"Prevention '93—Maryland" is the theme for this year's annual meeting, which will take place Thursday, April 29 through Saturday, May 1, 1993, at the University of Maryland, University Conference Center, College Park. Please fill out the registration form on the preliminary agenda immediately following the *Executive Director's Newsletter*. For room reservations, please call 1-800-727-8622 and give Med Chi's group number: G2568. Reservations must be made by March 29, 1993.

Medicare Training

The next **new provider** training session is scheduled for

DATE: March 3, 1993
TIME: 9:00 a.m. - 12 Noon
PLACE: Holiday Inn, 2004 Greenspring Drive, Timonium, MD 21093

To register, call 410-561-4037, 561-4057, 561-2058, or 561-4061. Give the representative your name, Medicare provider number, and the number of attendees from your office. To register by mail, write to Judy Tristani, Medicare B Professional Relations Dept., 1946 Greenspring Drive, Timonium MD 21093.

Performing Arts Medicine Conference

"Performing Arts Medicine II: Focus on Young Performers" is a conference on the special problems of performing artists scheduled for March 20-21, 1993 at the Med Chi Faculty Building, 1211 Cathedral Street, Baltimore. Sponsored by Med Chi's Committee on Medicine and Performing Arts, this conference is scheduled to include discussions on focal dystonia, eating disorders, Alexander and Feldenkrais techniques, drug side effects, conditioning and physical fitness, problems of marching musicians, and implications of the Americans with Disabilities Act. For more information about this conference, see the ad on pages 111–112 of this *MMJ*.

Disposal of Mustard Gas Program Scheduled for 1993 Annual Meeting

Because the military currently plans to dispose of mustard gas at Maryland's Edgewood Arsenal, a program on the treatment for mustard gas exposure is scheduled to be featured during the Med Chi annual meeting from 12:30 p.m. to 5:00 p.m. on Thursday, April 29, 1993. The four-hour program will feature sections on treatment of poison gas intoxication and organophosphate insecticide intoxication, and precautions needed during decontamination. Invited guest speakers include Hank Siegelson, M.D. and Sanford Leffingwell, M.D. from the Centers for Disease Control in Atlanta. To register for this program, please fill out the annual meeting registration form and indicate your interest in this specific program. Watch the *MMJ* for more information about this program.

President's Regional Conference—Southern Maryland

The President's Regional Conference for Southern Maryland will be held at the Holiday Inn in Solomons, Maryland at 4:30 p.m. on April 1, 1993. Surveys have been mailed to physicians in Southern Maryland requesting that they submit subjects of interest. If you have not yet submitted your subjects, please feel free to call and add them to the agenda. Watch the *Executive Director's Newsletter* for more information about this conference or contact Joan Mannion at 410-539-0872 or 1-800-492-1056.

Med Chi Sponsors Press Conference to Announce Innovative Anti-Smoking Campaign

On January 11, 1993, Med Chi held a press conference to announce an innovative anti-smoking campaign that targets the advertising of tobacco products. The campaign focuses on physicians using peel-and-stick labels that read: "WARNING: This magazine contains cigarette advertisements. Your physician does not support the use of any tobacco products or the advertising of such products." The following media covered the story:

Television	- WMAR-TV (Channel 2, Baltimore)	- WJZ-TV (Channel 13, Baltimore)
	- WBFF-TV (Channel 45, Baltimore)	- WBOC-TV, Salisbury
Radio	- WBAL-AM, Baltimore	- WCBM-AM, Owings Mills
	- WFMD-AM, Frederick	- WGMS-AM/FM, Rockville
	- WMAL-AM, Washington	- WPOC-FM, Baltimore
	- WSER-AM, Elkton	
Newspaper	- *Arundel Sun*, Anne Arundel County	- *Baltimore Sun*, Baltimore
	- *Carroll Sun*, Carroll County	- *Daily Record*, Baltimore
	- *Evening Sun*, Baltimore	- *Howard Sun*, Howard County

For more information on this topic, see the president's letter following this *Executive Director's Newsletter.*

Security Alert — Committee on Emergency Medical Services Offers Security Checklist for Freestanding Physician Offices

A recent assault of two physicians occurred in a private office. The increasing nature of violence in our society suggests the importance of reviewing building security plans in all freestanding physician offices. For whatever reason, when the assault occurred, the response to the call for help was delayed, allowing more physical abuse.

You should review your office security building plans. A checklist for your convenience follows:

1. Examine the adequacy of your plan for addressing physician and staff assault situations in all areas of the suite.
2. Check that the names of security personnel are current.
3. Verify that telephone numbers of security personnel are current and accurate.
4. Determine if staff are aware and trained to report in accordance with the plan/procedure.
5. Establish a means for the physician to alert staff to contact security if an assault occurs in the physician's office.
6. Call security/police to determine the response time in the event of an assault.
7. Have police or security personnel evaluate your plan.

8. Ensure that the plan and needed telephone numbers are readily available/visible for use.
9. Conduct a test of the plan—verify that staff act properly and in a prompt manner.
10. Establish a mechanism to ensure that new staff are oriented regarding the plan.
11. Test the plan quarterly or semiannually to ensure staff's familiarity with it and assess the need for changes.

CLIA Regulation

The January 19, 1993 *Federal Register* contains a technical correction to the CLIA regulation. The final regulation, which has a 60-day comment period, establishes the physician-performed microscopy category. This new category includes vaginal wet mount preparations, pinworm examinations, fern tests, post-coital examinations, KOH (potassium-hydroxide) preparations, and urine sediment. For futher information, contact Rose Matricciani at 410-539-0872 or 1-800-492-1056.

"Gag Rule"

President Clinton reversed the "gag rule," thereby allowing the entire health care team of physicians, nurses, and counselors the freedom to discuss all medical options with patients.

Fetal Tissue Research

The ban on fetal tissue research has been lifted by President Clinton in an executive order issued on January 22, 1993.

HCFA's Medicare Fee Schedule

Some of the changes in Medicare's fee schedule for 1993 are

1. Nonsurgical services receive a 0.8 % increase. The conversion factor for nonsurgical services is $31.249.
2. Surgical services receive a 3.1 % increase. The conversion factor for surgical services is $31.962.
3. The separate anesthesia conversion factor is increased by the nonsurgical update from $13.94 to $14.05.
4. New payment floors for all providers for clean claims are
   a. electronic claims—14 days
   b. paper claims—27 days

   Interest will be paid after 24 days for participating physicians on clean claims only.
5. The limiting charge is 115 % of the fee schedule amount for nonparticipating physicians in 1993.

Important Notice Regarding Classified Advertising in the MMJ

The *MMJ* Editorial Board decided that effective with the April 1993 issue, prepayment is required for all classified advertising. If you have any questions about this new policy or about classified advertising, please call Lori Robinson at 410-539-0872 or 1-800-492-1056. For complete details about classified advertising, see page 123 in this issue of the *MMJ*.

New Physician/EKG Bills

The following bills have been introduced into Congress:

- S 31 — Senator John McCain (R-AZ) — repeals the reduced Medicare payment rate for new physicians during the first four years of practice;
- S 176 — Senator Robert Dole (R-KS) — contains provisions to repeal the new physician payment cuts and to restore payment for EKG interpretations;
- HR 21 — Representative Dan Rostenkowski (D-IL) — contains provisions to repeal the new physician payment disparity and restore EKG payments; and
- HR 421 — Representative Robert Torricelli (D-NJ) — contains provisions to restore the EKG payments.

HHS Seeks Nominations for Advisory Council

The Agency for Health Care Policy and Research of the Department of Health and Human Services (HHS) in Rockville, Maryland is seeking nominations for the National Advisory Council for Health Care Policy, Research, and Evaluation. The agency will replace six members, representing research and the health professions, whose terms expire next May. For more information, call Bob Isquith, Public Relations Branch Chief of Health Care Policy Research at 301-227-8370.

WRITER'S DIRECT DIAL NO.

December 30, 1992

Dear Friend:

I am writing to alert you to operations which are preying upon medical professionals in this state and around the country. Essentially, these out of state operations sell advertising space in brochures which they claim will be distributed to thousands of union members. These operations typically misrepresent their affiliation with a union and/or exaggerate the circulation of their advertising brochures.

In order to protect against this problem, we recommend that medical professionals take the following precautions:

- Request that phone solicitors send written material describing their company and what they are selling.
- Be wary of any solicitor who offers to pick up money by a courier.
- Ask for specific union affiliation and then verify that affiliation.

If you have any questions about a particular solicitor or about their affiliation with a particular union, you can contact President Ernie Grecco (who brought this matter to my attention) of the Metropolitan Baltimore Council of the AFL-CIO at (410) 242-1300. He, like other labor leaders in our state, is greatly concerned about this deceptive practice. I urge you to share this warning with your members. Thank you very much.

Very truly yours,

J. Joseph Curran, Jr.
Attorney General

cc: President Ernie Grecco

Medical
and Chirurgical Faculty
of Maryland

President's Letter

Prepared by the president of the Medical and Chirurgical Faculty of Maryland as a service to members

January 1993

Dear Colleague:

Your patients' health is on the forefront of your agenda and ours. More of your patients will die from cigarette-related illnesses than from other drugs, alcohol, homicide, suicide, car accidents, fires, and AIDS combined. Something must be done to help your patients stop smoking.

The Medical and Chirurgical Faculty of Maryland (Med Chi) has initiated an innovative anti-smoking campaign to assist you in warning your patients about the dangers of smoking. The campaign began with the development of an educational program titled "How to Help Your Patients Stop Smoking," and included the distribution of an anti-smoking public service announcement to local television stations. The latest effort in this campaign, which was reviewed and approved by the legal division of the American Medical Association, targets the advertising of tobacco products.

Inside this issue of the *Maryland Medical Journal* you will find one set of peel-and-stick labels that read: "WARNING: This magazine contains cigarette advertisements. Your physician does not support the use of any tobacco products or the advertising of such products."

Med Chi will provide a supply of these labels to you at no charge. I ask that you place these labels on waiting room magazines that contain tobacco advertising. The use of these labels in your waiting room will give you the opportunity to discuss smoking cessation with your patients.

To the best of our knowledge, Med Chi is the only state medical society involved in this kind of effort, making patients aware of the cigarette advertisements in magazines. Governor William Donald Schaefer issued a statement applauding Med Chi's anti-smoking initiative. But, I need your help to make this campaign successful. Please work with us to promote a healthier Maryland.

To obtain additional labels, at no charge, please call (410)539-0872 or 1-800-492-1056 and place your order with the switchboard operator.

Sincerely,

Jose M. Yosuico, M.D.
President

195th Annual Meeting

of the

Medical and Chirurgical Faculty of Maryland

at the

University of Maryland
University College Conference Center

Thursday-Saturday, April 29-May 1, 1993

Prevention 1993 — Maryland

Preliminary Agenda*

Thursday, April 29, 1993

8:30 am - 5:00 pm — **Registration/Exhibits open**

Maryland Society of Physical Medicine and Rehabilitation and the Maryland Society of Orthopaedic Rehabilitation and Occupational Medicine
CME Credit: 1

3:30 pm - 5:30 pm — **"Significant Changes in CME Policies and Procedures"**
Med Chi Continuing Medical Education Review Committee
CME Credit: 2

Support Our Exhibitors

Exhibits are an important part of Med Chi's annual meeting and are a valuable adjunct to the scientific program.

By visiting the exhibits before and after your scientific program, you will help ensure that Med Chi receives valuable income that allows us to offer you annual and semiannual meetings.

Med Chi urges you to express your appreciation to exhibitors by visiting their booths and discussing your mutual involvement in patient care.

---

* Please note this is a preliminary agenda. More meetings, events, and continuing medical education activities may be added to the advance program which will be published in the *Maryland Medical Journal* prior to the meeting.

Continuing Medical Education Credits

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education activity for up to 16 credit hours in Category 1 of the Physicians Recognition Award of the American Medical Association. Physician's attending this year's meeting can earn up to a maximum of 16 CME credits.

Directions

The University of Maryland University College Conference Center is located at the corner of University Boulevard and Adelphi Road in College Park, Maryland.

From Baltimore and points north: Take I-95 South to the Capital Beltway (I-495) toward College Park. Take exit for U.S. 1 South (Exit 25B). Proceed approximately 1 mile south on U.S. 1 and turn right onto MD Route 193 West. At 3rd traffic light, turn left onto Adelphi Road. On Adelphi, make first, immediate left onto Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

From Bowie/Anapolis areas and points east: Take MD Route 50 to Capital Beltway (I-95). Go north on 95 to College Park. Take exit U.S. 1 South (Exit 25B). Proceed approximately 1 mile south on U.S. 1 and turn right onto MD Route 193 West. At 3rd traffic light, turn left onto Adelphi Road. On Adelphi, make first, immediate left onto Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

From Washington, D.C.: Take George Washington Parkway to I-495 (toward Rockville). Follow I-495 and take exit for New Hampshire Avenue/Takoma Park (650). Go south on New Hampshire Avenue and turn left at the second light (Adelphi Road). Stay on Adelphi Road for approximately 3 miles (you will go through 3 traffic lights). At the 4th light, turn left on Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

From Montgomery County and points west: Take the Capital Beltway (I-495) to New Hampshire Avenue/Takoma Park (650). Go south on New Hampshire Avenue and turn left at the second light (Adelphi Road). Stay on Adelphi Road for approximately 3 miles (you will go through 3 traffic lights). At the 4th light, turn left on Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

* A parking garage for the Conference Center is scheduled to be completed May 1, 1993. If necessary, Med Chi will publish updates about parking at the Conference Center in the *MMJ*.

WE'RE BUILDING A GREAT INVESTMENT FOR YOU.

RIVER FALLS
Potomac's Family Community.

These days, it's hard to find an investment that's both prudent and rewarding. Which is why right now is the time to consider the advantages of investing in a River Falls luxury home. You've never had more going for you.

From a strictly financial aspect, River Falls homes have performed admirably. Through the ups and downs over the past 23 years, they've posted a track record of significant appreciation and lasting durability. Marketability that's a testament to timeless designs, construction by teams of in-house craftsmen, and one of the most beautiful, convenient locations in the Potomac/Bethesda area.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities

Today, a River Falls home is still an eminently affordable investment and a smart one too. Four-to-six bedrooms start in the $600's with absolutely no compromise in quality. There's terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go well beyond dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs. Nearby are excellent public and private schools, convenient shopping and easy access to suburban Maryland, downtown D.C., and Northern Virginia.

Where else can you get such a sound investment with such outstanding returns? Take an hour to visit River Falls and see how great your future can be. For you, and for your family.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.
HOURS: 12-5 daily.
PHONE: (301) 299-3700.
Brokers welcome.

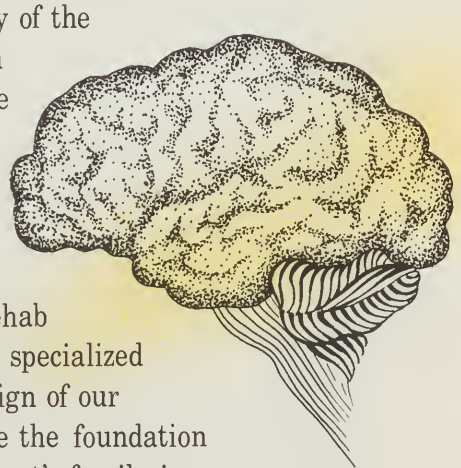
THE BRAIN

The human brain can compose silly rhymes or beautiful poetry.

It can imagine a dream world or study the mysteries of the atom.



It can remember two dozen birthdays or forget one anniversary.

It can recall the good old days or predict the future.

It can hide emotions or laugh uncontrollably.

It can uncover the meaning of love or the meaning of life.

At Maryland General-Bryn Mawr Rehab Center, we understand the power and complexity of the brain. We also understand that when an individual sustains a brain injury, stroke or other neurological condition, extensive knowledge and enormous energy are required to guide the person toward a successful recovery.

Our affiliation with Bryn Mawr Rehab brings twenty years of knowledge to our specialized treatment programs. The innovative design of our facility and our experienced staff provide the foundation to assist you, your patient and your patient's family in setting goals for recovery and then achieving them. Working together, just think what we can accomplish.

Still Doing What We're Known For, Only Better.

Sheppard Pratt is known for treating severe and persistent mental illness. While that once may have suggested lengthy or repeated inpatient stays, such a perception would hardly fit Sheppard Pratt today. A full service mental health system, we offer outpatient therapy centers, day hospitals, community rehabilitation programs, and supervised housing in addition to our 322-bed hospital. For patients with schizophrenia or severe dissociative, affective, personality or eating disorders, a hospital stay may be unavoidable. But the Sheppard Pratt advantage is an internal case management function that facilitates movement to a less restrictive treatment setting and return to the referring professional as soon as the patient is ready. We provide a continuum of care within every area of psychiatry:

- Addictions Recovery
- Mood Disorders
- Eating Disorders
- Personality Disorders
- Dissociative Disorders
- Severe and Persistent Mental Illness
- Child and Adolescent Psychiatry (with a K through Grade 12 school on the hospital campus)
- Geropsychiatry

LETTERS TO THE EDITOR

University of Maryland's experience with chorionic villus sampling: A different view of this questionable procedure

We reviewed the article entitled "Chorionic villus sampling: The University of Maryland experience" by W. Allen Hogge, M.D. et al in the June 1992 issue of the *Maryland Medical Journal*.[1]

In this study, the University of Maryland reported their experience on performing chorionic villus sampling (CVS) on 998 patients with a 99.1% success rate. The overall loss rate was 2.3%, and there was no increase in the incidence of birth defects seen. The authors concluded that these observations demonstrated that CVS provides a safe and accurate alternative to amniocentesis. We think that the University of Maryland's success rate of 99.1% indicates a high degree of technical expertise and is quite laudable; however, we cannot agree that the observations in this study demonstrate that CVS provides a safe and accurate alternative to amniocentesis, nor do we think that CVS is even a desirable alternative to amniocentesis.

Numerous recent studies from England published in the *Lancet,* as well as studies performed at the Michael Reese Hospital in the United States, have linked CVS to a significant increase in limb deformities.[2–6] The study by the University of Maryland of 998 patients is not large enough to conclude one way or the other whether there is an increase in limb reduction defects.

The overall loss rate seen by the University of Maryland was 2.3%. It is difficult to assess the true meaning of this loss rate since it is not possible to determine how many of the pregnancy losses were due to the procedure and how many would have occurred in any case. A much larger prospective European study[3] has demonstrated that CVS results in a greater than 4% increase in loss rate due to the procedure itself when compared to amniocentesis. American and Canadian studies have estimated a loss rate of 0.8 to 2.7%.[7,8] Even this lower loss rate is far in excess of that expected in experienced hands with amniocentesis. The amniocentesis loss rate is generally quoted as less than 0.2% One should keep in mind that the finding of chromosome abnormalities in the general at risk population for these procedures is usually in the order of magnitude of 1% to 2%; therefore, a 2% loss rate or a 10-fold increase in loss rate over that attributed to amniocentesis is rather a significant increase from the procedure.

There are other reasons why we find that CVS is not as desirable a procedure as amniocentesis. One of these is that CVS does not provide a neural tube defect diagnosis. Patients undergoing CVS should have maternal serum alphafetoprotein (AFP) testing done at 16 weeks of pregnancy. If this is positive, and it will be positive in approximately 5% of the cases, patients who have already undergone CVS must also undergo amniocentesis. Additionally, some of the chromosomal results from the CVS are indeterminate, and these patients also must undergo amniocentesis. As the University of Maryland's study indicated, mosaicism was detected in 11 cases (1.1%), but only three of these abnormalities were confirmed either on amniotic fluid cells or fetal tissue. This represents a true abnormality rate of 27.3% when a mosaicism result is detected by CVS. Thus, CVS can result in an indeterminate chromosomal status that requires additional amniocentesis.

The major advantage of CVS is that results can be obtained earlier in the pregnancy than the results obtained with amniocentesis. CVS is generally performed between 10 and 12 weeks menstrual age. We believe that to some patients this is an important advantage; however, we and others have found that early amniocentesis performed between 11 and 14 weeks provides a superior method of early diagnosis for these patients. Early amniocentesis appears to be a safe procedure, although there is less experience with it than there is with traditional amniocentesis, which is performed from 15 weeks onward.[9–11] Early amniocentesis does indeed provide a neural tube defect diagnosis. In order to provide this diagnosis, we have been gathering median values of amnionic fluid AFP at 11 to 14 weeks menstrual age for the past two years. These weeks are not difficult to measure with the standard amniotic fluid AFP test kit because the amnionic fluid AFP during these weeks is in fact higher than that found from 15 weeks onward. Therefore, we have found no technical difficulties in making a neural tube diagnosis on amniotic fluid from the early amniocentesis. Acetylcholinesterase tests can also be performed to back-up these test results in early amniocentesis.

We have been providing our patients with three choices with regard to prenatal diagnosis. Our first choice is traditional amniocenteses, which we believe is the standard of care in the field. The widest amount of data is available with regard to the safety and accuracy of this procedure. Our second choice has been early amniocentesis. As we mentioned earlier, amniocentesis provides an answer almost as early as that of CVS while apparently exposing the patient to fewer risks and less ambiguous results, as well as providing the patient with a neural tube defect analysis. Our third choice is CVS. For patients to receive a CVS, we require that they undergo counseling and that they be made aware of the two alternate procedures—namely regularly am-

The University of Maryland defends its position

We appreciate the opportunity to respond to the letter to the editor entitled "University of Maryland's experience with chorionic villus sampling: A different view of this questionable procedure." We also appreciate the authors' interest in our study.

The letter reflects a rather selective review of the literature and a rather selective interpretation of that literature. To take the authors' concerns in order, the information regarding limb abnormalities has been found in only a few sporadic locations around the world and almost always in centers with limited experience doing chorionic villus sampling.[1,2] A more balanced view of the subject can be found in the recent *Lancet* article describing the results of over 100,000 chorionic villus samplings with complete follow-up of those patients.[3] In this study, the incidence of limb abnormalities following chorionic villus sampling was no different than the background rate of this disorder. Therefore, it is safe to conclude that the risk of limb-reduction defects following chorionic villus sampling done at the correct gestational age in experienced programs is not significantly increased over that of the general population not undergoing chorionic villus sampling. Certainly it is appropriate to inform patients of these studies and discuss in a balanced fashion the available literature on this topic.

Secondly, the authors comment on our 2.3% loss rate. They seem to have focused on the older studies, such as the prospective European study,[4] and have ignored the most recent report from the National Institutes of Health (NIH) Collaborative Study.[5] In any case, it should be pointed out that the Medical Research Council (MRC) study has been criticized for a number of reasons. The most important reason was the significant inexperience of the investigators in this study. To be included in the study, the investigator needed only to have experience in performing chorionic villus sampling in 30 practice procedures (that is, pregnancies planning to have termination following the practice procedure). It should not be surprising that the loss rate in the hands of very inexperienced CVS operators, compared with those with significant amniocentesis experience, should be dramatically different. Of note, the most recent NIH study found an overall loss rate of 2.8% for chorionic villus sampling, which indicates a significant decrease from the original study that had been done when many of the programs were inexperienced. Given the new information, the study suggests that the risk of chorionic villus sampling is not different than that of amniocentesis.

The authors state that "the amniocentesis rate is generally quoted as less than 0.2%." We know of no study that documents this low a loss rate. The generally accepted loss rate for amniocentesis is 0.5%, and this is a traditional risk figure that is not supported by recent data. The more recent data in a well-controlled study of experienced individuals, using ultrasound guidance, found a 1% greater risk for patients undergoing amniocentesis than for those not having amniocentesis.[6] Therefore, the authors would do well to review their own data with respect to this loss rate figure.

niocentesis and early amniocentesis. We also feel compelled to inform these patients of several relatively conservative facts concerning CVS.

1. Many studies have associated CVS with an increased rate of miscarriage in the range of 0.8 to 4.5%.
2. Several studies have associated CVS with an increase in limb reduction defects.
3. CVS does not provide a neural tube defect analysis and, therefore, maternal serum AFP screening at 16 weeks is necessary. Five percent of the patients subsequently have to undergo amniocentesis as well as a CVS.
4. CVS chromosome analysis yields ambiguous results in 1 to 2 % of the cases, and these patients must also undergo a follow-up amniocentesis to resolve the ambiguity.

Patients who are fully counseled in this way may then elect to have CVS performed in our units. It has been our experience and that of others, that most patients when so counseled elect either regular amniocentesis or early amniocentesis. Only a small percentage of the patients, when fully informed, actually elect CVS.

We agree with Dr. Felix de la Cruz of the National Institutes of Health,[12] who stated that he thinks electing CVS is a personal choice, but that the patient should be provided full information for informed consent. We think it's important that clinicians be fully aware of the potential problems with CVS, and, in fact, a number of major CVS units are either shutting down or vastly limiting access to this procedure. We think that patients should have the choice, but when fully informed, CVS will be selected by a small minority of patients over the alternatives of regular amniocentesis and early amniocentesis.

We conclude that based on data in the literature, serious questions have been raised regarding the safety and accuracy of CVS as a diagnostic method for first trimester diagnosis.

References

1. Hogge WA, Hogge JS, Keene CL et al. Chorionic villus sampling: The University of Maryland experience. *Md Med J* 1992; 41:523–25.

The authors then state that chorionic villus sampling is not as desirable a procedure as amniocentesis because of the lack of information regarding the risk for neural tube defects. They equate the risk of a first positive maternal serum alphafetoprotein (AFP) with the incidence of amniocentesis in patients undergoing chorionic villus sampling. Again, they should review the literature to understand that although 5% of the population will have an elevated maternal serum AFP, if the usual protocol of repeating the sample followed by ultrasound dating is performed, the risk of an unexplained elevation of AFP will be closer to 1.5%. In view of the excellent ability of ultrasound to detect neural tube defects, the number of patients requiring amniocentesis should be quite small in the population that has undergone chorionic villus sampling.

The authors continue with the assumption that early amniocentesis may be a better alternative than chorionic villus sampling because it provides information regarding neural tube defects. What the authors have failed to recognize is that the determination of median values for amniotic fluid AFP at 11 to 14 weeks menstrual age does not give them information regarding the detection rate for neural tube defects in this gestational age group. Much more data will need to be obtained in order to determine if the detection rate for neural tube defects is the same at 11 to 14 weeks as it is from 16 to 18 weeks of the pregnancy. More importantly, the authors state that an acetylcholinesterase test can be performed as a back-up to these tests. There is significant literature to support the fact that there is a high false-positive rate of acetylcholinesterase in early amniocentesis, resulting in a significant number of patients requiring a second amniocentesis.[7]

The authors' letter also implies that early amniocentesis has been studied and is safe. What they fail to tell the patients is that there is no controlled study that has been done comparing early amniocentesis with either chorionic villus sampling or standard amniocentesis, although at least one limited study in an experienced center showed the risk of pregnancy loss following early amniocentesis to be twice that of chorionic villus sampling and four times that of traditional amniocentesis.[8] This certainly would suggest that the procedure is not a safe alternative to chorionic villus sampling, but sufficient information is not available to make statements regarding the risk of early amniocentesis.

In addition, there are significant concerns regarding the removal of amniotic fluid at 12 to 14 weeks' gestation, which is a critical time for fetal lung development. In view of the documented increase in respiratory distress and pneumonia after midtrimester amniocentesis, respiratory difficulties after early amniocentesis must be a significant concern to be answered by controlled studies.[6] In addition, there is concern about normal development of joints and the risk of such disorders as clubfoot following early amniocentesis. What the authors failed to recognize is that early amniocentesis remains an investigational procedure, and well-controlled studies need to be done to compare it with traditional amniocentesis and chorionic villus sampling, both of which ave been studied extensively. What studies have been done to date do not support the statement of the authors that "early amniocentesis exposes the patient to fewer risks and less ambiguous results, as well as providing the patient with a neural tube defect analysis."

MICHAEL E. TRIGG, M.D.
Genetic Consults of Virginia,
Falls Church, VA.
Professor of Pediatrics, University of Iowa, Iowa City, IA ■

In closing, the authors failed to recognize the first rule of prenatal diagnosis. That is, the patient should be given a fair evaluation of all available options. The authors imply, by the use of their term, "our first choice," that the counseling is not nondirective, but, in fact, extremely directive regarding the various procedures. The letter, as written, suggests that the authors do not give a balanced view of all available options for the patient. The "facts" concerning chorionic villus sampling, as outlined by the authors, are all in error and reflect significant bias. Informed consent for the patient implies that the individuals giving this information are also informed. The statement that "a number of major CVS units are either shutting down or vastly limiting access to this procedure" is entirely false and continues the series of misstatements and misrepresentations that not only misinform the journal's readership, but have likely misinformed patients seeking prenatal diagnosis.

The conclusions of our study remain the same. The safety and accuracy of chorionic villus sampling do allow it to be favorably compared with traditional amniocentesis and offered as an alternative to the patient. The decision regarding which procedure to choose should be the patient's, based on unbiased presentations. The University of Maryland offers chorionic villus sampling, traditional amniocentesis, and early amniocentesis. The option for these procedures is based on the patient's informed consent. Until further information is available, the option of early amniocentesis should be offered only as part of an investigational protocol.

We thank the authors for allowing us to respond to their concerns.

LETTERS TO THE EDITOR

Is a lobbyist really necessary?

Isn't it time to re-evaluate the need for professional lobbyists to represent Med Chi. In the past, physician representatives from our society who were willing, knowledgeable, and respected served our society well. They were aided by Med Chi's administrative staff whose job it was to inform them of pending legislation and assist them in obtaining an audience before legislative committees. Their emphasis was on the health of our community, but they were also aware of the needs of the medical profession.

Recently, our society retained a firm of lawyers who were expensive, did not always speak for our membership, and who perhaps could be accused of conflict of interests. I read in the *Sun* papers that they have been dismissed. Instead we have retained our ex-governor to be our lobbyist. Are his qualifications better?

Is our medical society so lacking in educated and honest members who are willing and able to represent us before legislative committees that we must hire a professional lobbyist? Do we need professional lobbyists at all?

FRED J. HELDRICH, M.D.
Baltimore

Response from the leadership

We welcome the comments expressed in Dr. Heldrich's letter. In the past, it was indeed physician involvement with representatives that led to Med Chi's successes in Annapolis. Our Legislative Committee has traditionally done its job very well, and we are once again returning to the concept that Med Chi is a physician-directed organization.

It should be noted that Dr. Martinez has been appointed as Legislative Committee chairperson for 1992-93 and, as in the past, has organized the Legislative Committee into subcommittees (e.g., public health, medical practices), each designed to address specific functions. This was done so as to develop a cadre of informed and knowledgeable physicians who will testify in Annapolis on cited subjects. This committee, supported by two vice chairpersons, Hilary O'Herlihy, M.D., and J.R. Lilly, M.D., will assure our success. We are all aware that success in Annapolis during the past few years has often been based on access to policy-makers.

To assist during this transition period, from being led by outside lobbyists to having physicians once again represent physicians, we needed someone who had knowledge of the system in Annapolis and could ensure that physicians would be given the appropriate opportunity to be heard.

Our former lobbyists resigned October 28, 1992, leaving insufficient time for our physicians to cultivate the relationships necessary to increase the probabilities of success in Annapolis. This left us with little choice but to obtain the services of one who knew the players in Annapolis and had knowledge of the system, former Governor Marvin Mandel.

He appeared to be the best choice to meet our current needs and help Med Chi through this transition period.

JOSE YOSUICO, M.D.
President

LETTERS TO THE EDITOR

A trenchant reader writes

Thanks for "Star wars" (*MMJ* Word Rounds. October 1992). Great reading.

Yet, and for my own peace of mind, should not *allemond* and *trenches* have been *allemand* and *trenchées*, respectively?

I am in a happy state of retirement, and as you can sense, I have the time to delve in, what one might term, trivial matters.

I send you this note in friendship.

ARMAND J. LANDRY, M.D.
Salisbury

The writer responds from the trenches

Thank you for noticing the error in my spelling of the French *allemand* 'German.' However, I believe that the French precursor of trench is *trencier* 'to cut or dig', which itself stems directly from Latin *truncare* 'to mutilate.'

Incidentally, there was a popular German dance in the 16th century—a stately processional performed in 4/4 time—which became fashionable at the French court of King Henry the IV. The French called it the **Allemande** in honor of its country of origin. It begat a stylized musical genre, which was usually written as the first movement of a suite, as in Bach's *English Suites.*

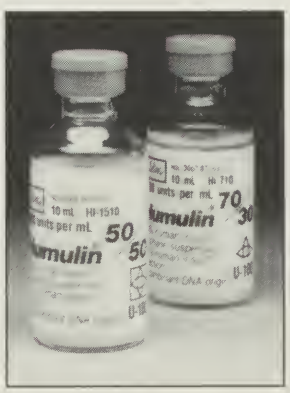
As dances evolved and emigrated to North America, a form known as the **square dance** developed. By the 19th century it had become one of the most popular dances in our country and was now led by callers who shouted out the choreographic variations to each group of four couples. One of these is "allemande left—or right," an improvisation on those earlier forms.

They also call out the "do-si-do"—a variation of the French *dos-a-dos* 'back to back', which derives from the Latin *dorsum.*

In any case, your observations were quite **trenchant.**

BART GERSHEN, M.D.
Rockville ■

Erratum



In the December issue, the name of the author of the letter to the editor entitled, "The future of medicine—The doctor's role," was not listed. The author was J.T.H. Johnson, M.D. of Brooklandville, Maryland. The *MMJ* regrets the error.

Because One Size Doesn't Fit All...

New Humulin 50/50 is the tailor-made answer to individual patient needs. A unique combination of equal amounts of Regular human insulin and NPH human insulin, it will be useful in situations in which a greater initial insulin response is desirable for greater glycemic control.

Like Humulin 70/30*, new Humulin 50/50 offers the convenience and accuracy of a premix. And it can be used in conjunction with an existing 70/30 regimen.

New Humulin® 50/50

50% human insulin isophane suspension
50% human insulin injection (recombinant DNA origin)

The Newest Option in Insulin Therapy

WARNING: Any change of insulin should be made cautiously and only under medical supervision.

* Humulin® 70/30 (70% human insulin isophane suspension, 30% human insulin injection [recombinant DNA origin]).

Have you come a long way, baby?
Smoking trends in women

Cynthia M. Lipsitz, M.D., M.P.H.

Dr. Lipsitz is director of the Bureau of Personal Health, Howard County Health Department, Columbia, MD.

The relative risks of smoking-related diseases are increasing for women as the ratio of men smokers to women smokers closes. In addition, recognition of smoking as a women's health risk has increased because of its adverse effects in pregnancy; its interaction with oral contraceptives; and its association with cancer of the uterine cervix, earlier menopause, and osteoporosis.

The surgeon general's first report on smoking in 1964 drew worldwide attention with its conclusion that "cigarette smoking is causally related to lung cancer in men; the magnitude of the effect of cigarette smoking far outweighs all other factors. The data for women, though less extensive, point in the same direction..."[1]

"I'm a Lucky Girl"
Cigarette advertisement from 1930.[2]

"You've come a long way, baby."
Cigarette advertisement from 1980.

By 1980, the surgeon general of the United States devoted his annual report on the health consequences of smoking to its effects on women. Noting that "the rise in lung cancer death rates is currently much steeper in women than in men," he projected that "the age-adjusted lung cancer death rate will surpass that of breast cancer in the early 1980s."[3] Around 1985, this occurred, and the trend has continued into this decade while the lung cancer death rate for men has leveled off.[4]

In addition to increasing the relative risks of several diseases affecting both sexes, such as lung cancer, smoking has been established as a women's health risk because of its adverse effects on pregnancy and child health; its interaction with oral contraceptives as a risk factor for myocardial infarction and subarachnoid hemorrhage; and its association with cancer of the uterine cervix, early menopause, and osteoporosis. As smoking among women continues to decline more slowly than among men, the health consequences of smoking for women remain of significant concern.

Historical trends

In the 1880s, the development of the cigarette manufacturing machine made cigarettes widely available and cheap. Men took up cigarette smoking in great numbers in the early 20th century, especially during World War I. Widespread cigarette use by women lagged behind men by 25 to 30 years.[3]

Although the prevalence of smoking among men has always remained greater than among women, the ratio of male-to-female adult smokers in the United States has declined steadily since 1935 (**Table 1**).[5] According to the Centers for Disease Control's (CDC) National Health Interview Survey, 49.4 million (28.1% of all adults) were current smokers in 1988: 25.6 million men (30.8% of all men) and 23.7 million women (25.7% of all women)—a ratio of 1.19.[6] In Maryland, data from the 1985 Current Population Survey for state residents aged 20 or older are consistent with the national trend, reporting 26.7% of Maryland males and 26.2% of females as current smokers.[7]

Table 1. Percentage of adults reporting themselves to be smokers, U.S., by sex and year*

Year	% Males (1)	% Females (2)	% Total (3)	Ratio male to female rates (4) = (1) - (2)
1935	52.5	18.1	n.a.	2.90
1955	52.6	24.5	37.6	2.15
1965	52.4	34.1	42.7	1.54
1970	44.5	31.9	37.8	1.39
1976	41.9	32.0	36.4	1.31
1980	38.3	29.4	33.6	1.30
1985	33.2	27.9	30.4	1.19

Note:
*For years 1965-85, the rates are for adults 20 years and older, taken from the Health Interview Survey; for 1955, adults 17 years and older, from supplement to Current Population Survey; ages not indicated for 1935.
From: *Selling Smoke: Cigarette Advertising and Public Health*, Kenneth E. Warner, ed. Copyright 1986 by the American Public Health Association. Reprinted with permission.

Beginning to smoke at an early age increases the risk of heavier smoking and smoking-attributable disease and death. Therefore, data that point to initiation of smoking at younger and younger ages, especially among females, cause particular concern. Overall, the average age at initiation of smoking descended from 19.7 years among persons born from 1910 through 1919 to 17.4 years among those born from 1950 through 1959. The average age at initiation descended considerably more for white and African-American women (5.4 and 4.6 years, respectively) than for white men (0.5 years); for African-American men there was a slight rise in the age of initiation (0.7 years).[8]

Although nationwide the prevalence of daily cigarette smoking among high school seniors decreased from 29% in 1976 to 21% in 1980 and has stabilized between 18% to 21% since then, the prevalence of smoking among high school senior females has consistently exceeded that among males since 1977.[1]

Until recently, smoking initiation was increasing among the least educated females.[9] Both national and Maryland data from the CDC's Behavioral Risk Factor Survey (BRFS) have shown an inverse relationship between the educational level achieved and cigarette smoking. This relationship could explain the alarming 44% prevalence rate of smoking observed among pregnant women enrolled in Maryland's public health maternity clinics.[7] National BRFS data from 25 states and the District of Columbia indicate that 35% of pregnant women who did not graduate from high school smoke cigarettes.[7] Pregnant women and women of childbearing age represent a critical population to reach with smoking control measures.

The American Cancer Society's Cancer Prevention Studies (CPS) characterized the smoking habits of men and women in the United States over two time periods: from 1960 to 1972 (CPS I) and from 1982 to 1986 (CPS II). Comparing the two study periods, women in each age cohort studied in the CPS II smoked more cigarettes a day and began smoking an average of 7.2 years earlier than women in CPS I.[4]

The CPS data have also shown that men and women differ in their choices of cigarettes based on their tar and nicotine content. In 1982, 34.8% of men smoked brands with less than 12 mg of tar, whereas these brands constituted 51.6% of brands smoked by women.[3] Some writers claim that women are more likely than men to smoke "low-yield" brands because women believe these brands are safer than other kinds of cigarettes.[10] However, while the amount of tar exposure has been associated with an increased relative risk of lung cancer in women and in men, tar content is less important in lung cancer risk than the number of cigarettes smoked.[4] A recent study of myocardial infarction risk among women also indicates about the same risk of myocardial infarction among low-yield smokers as among high-yield smokers.[11] It has been suggested that there is no "safe" cigarette.[12]

Mortality

As the surgeon general predicted in 1980, lung cancer deaths among women did exceed breast cancer deaths in the mid 1980s.

While lung cancer mortality rates increased two to fourfold among older male smokers over the two decades between CPS I and II, among women 45 and older, the rates increased four to sevenfold during the same time period. This, as part of the large increase in overall smoking-attributable mortality among women between 1965 and 1985, may be a direct consequence of the adoption of lifelong smoking initiated in their teenage years.[1] Of particular interest, among younger men

and women in the United States, death rates from lung cancer as well as heart disease have begun to decline, a trend attributed to the declining prevalence of smoking in this country.[13]

Deaths due to chronic obstructive pulmonary disease (COPD) have also increased in the past two decades among women who smoke. In those age 55 and older, COPD death rates increased two to threefold. Excess risk was much greater for individuals who smoked heavily than for light smokers.[1,3]

In 1991, the CDC updated its estimates of smoking-attributable mortality using data from 1988. Among the new categories of diseases added to the 1991 analysis were cervical cancer and perinatal diseases, both applicable to women only. Smoking appeared to increase the relative risk of cervical cancer death almost twofold, resulting in 1,246 deaths in the United States in 1988. Some 2,552 perinatal disease deaths (defined as infant deaths due to short gestation, low birthweight, respiratory distress syndrome, other respiratory conditions of the newborn, and sudden infant death syndrome) were attributed to smoking by the infant's mother during pregnancy.[13]

Although not included in the statistics on smoking-attributable mortality, fetal deaths also contribute to the death toll due to smoking. The 1980 surgeon general's report stated that "the risk of spontaneous abortion, fetal death, and neonatal death increases directly with increasing levels of maternal smoking during pregnancy."[3] One study published in 1988 showed adjusted infant mortality rates of 15.1 per 1,000 white nonsmokers and 23.3 per 1,000 for white women who smoke more than a pack a day. Among African-American women, the infant mortality rate was 26.0 for nonsmokers and 39.9 for smokers.[14]

Morbidity

Since the publication of the surgeon general's first report on smoking in 1964, thousands of studies have advanced our knowledge of the diseases associated with smoking and the strength of those associations. Information on the specific effects of smoking on women's health appeared more slowly than information for men because women were either not included or not represented in significant numbers in the earliest studies of smoking and health. Also, the later onset of widespread smoking among women possibly led to later recognition of the extent of its consequences.[15,16]

"Blow the smoke my way." Said by a female nonsmoking model to a male smoking model in a 1930s era cigarette advertisement.[12]

In 1979, the surgeon general stated in the 15th anniversary report the following summary of knowledge regarding smoking and morbidity in women:

> In general, female current cigarette smokers report more acute and chronic conditions including chronic bronchitis and/or emphysema, chronic sinusitis, peptic ulcer disease, and arteriosclerotic heart disease than women who never smoked.[3]

The association between maternal smoking and infant low birthweight, and between the use of oral contraceptives and increased harmful effects of smoking on the cardiovascular system were also recognized by 1979.[1] The 1980 report on smoking and women emphasized a causal association between smoking and cancer of the lung, larynx, oral cavity, and esophagus in women as well as men.[3]

Since that time, the litany of diseases related to smoking has grown, and further studies have confirmed previously suspected causal relationships. Involuntary smoking has been established as a cause of disease, including lung cancer, in healthy nonsmokers regardless of sex. Recently, some authorities have claimed, based on evidence as extensive as that linking involuntary smoking and lung disease, that there is a causal link between involuntary smoking and heart disease.[17] The 25th anniversary surgeon general's report of 1989 declared a causal relationship between smoking and cerebrovascular disease, a relationship potentiated in women by use of oral contraceptives. This report also cited an association between smoking and cancer of the uterine cervix, persisting after adjustment for other known causal factors, such as multiple sexual partners, sexually transmitted diseases, and early coitus.

Tobacco advertising and women

Although the tobacco industry claims that its advertising is aimed at current smokers in order to increase each company's market share, the consensus within the public health community is that advertising exerts significant influence on nonsmokers adopting the habit.[5]

Tobacco advertising aimed at women illustrates this point. Warner noted, "Among the most significant advertising trends in the past three decades has been the aggressive advertising of cigarettes marketed for women. The advertising campaign emerged well before, and led to, the diffusion of the habit within the target group (women)."[5]

Indeed, women became a target group of the tobacco industry during the 1920s and 1930s. Many of the popular advertising themes of this era persist today. Upward social mobility, sophistication, financial success, and independence remain strong messages, especially in advertising and promotional events geared toward blue-collar workers and African-Americans.[18] Blum has even stated that "the tobacco companies were the first to offer women equal rights."[12]

"The shock of facing what your figure may become... when tempted, reach for a Lucky instead of a sweet." 1930s era cigarette advertisement [12]

Early advertisements aimed at women touted cigarettes as a reliable method of weight control, a claim whose appeal continues today. Surveys of young adults have revealed that women smokers are substantially more concerned about weight gain if they quit smoking than are men (57.9% versus

26.3% expressing concern).[19] Several recent reports have established a relationship between weight gain and smoking cessation. However, major weight gain (greater than 13 kg) is likely to occur in only a minority of those who stop smoking, and the health benefits of quitting greatly exceed the risks of the usual amount of weight gain.[20,21]

Perhaps the most misleading theme in tobacco advertising, smoking as an element of a healthy lifestyle, has targeted women in a number of ways. The sponsorship of women's tennis events by the Phillip Morris company (makers of Virginia Slims cigarettes) provides the most notorious example. Not only does this sponsorship associate cigarettes with vigorous physical activity, but it circumvents the federal restrictions on broadcast advertising of tobacco products by keeping the product's name in the public eye. Other companies also use physical exercise in their advertisements and promotions: Vantage cigarette advertisements show models dancing, and Kent portrays models cooling down with a cigarette after a hard tennis game.[5]

Of all publications, women's magazines are most influenced in their coverage of smoking and health issues by tobacco advertising revenue. Studies from the 1970s inversely correlated the acceptance of cigarette advertisements with the frequency of articles with an anti-smoking theme published in women's magazines.[5] Small sample sizes and lack of statistical control limited these studies. A recently published, more rigorous statistical analysis of the relationship between cigarette advertising and the publication of articles in 99 US magazines on the risks of smoking over a 25 year period (1959–1969 and 1973–1986) revealed strong evidence that such advertising is associated with diminished coverage of smoking hazards, especially in women's magazines.[22]

Smoking control

"Smoking control" refers to efforts to limit smoking, either preventing smoking initiation or bringing about smoking cessation. Analogous to the public health model of interaction between agent, host, and environment as the cause of disease, we may say that smoking control seeks to limit smoking-related disease by modifying the agent—the cigarette; the host—the individual smoker or nonsmoker; and the environment—the surroundings that influence the individual.

"Alive with pleasure." 1992 Newport cigarette advertisement.

Agent. It is generally held that cigarettes have no recommended use and that "tobacco is the only major legal product that is hazardous when used as intended...."[23] Therefore, anti-smoking advocates see the elimination of tobacco production as the best method to control the agent of smoking-related disease. Short of this politically charged extreme, other agent-control strategies such as limiting access to tobacco, especially access by vulnerable populations such as adolescents, have recently gained prominence.

In 1990, the United States Department of Health and Human Services (USDHHS) recommended a model law—the Sale of Tobacco Products to Minors Act—to states and localities to prevent the sale of tobacco products to minors.[24] A key provision of this and of a number of bills before the Maryland General Assembly in the past two years places a ban or restriction on the use of cigarette vending machines. Increasing taxes on these products offers another method to reduce access to tobacco products. In addition to raising funds earmarked for the prevention of smoking-related diseases, increasing the price of cigarettes through taxes has been shown to decrease consumption in the United States, Canada, and other countries.[14,25]

Environment. Environmental strategies for smoking control include a variety of approaches ranging from changing the social environment to adopting tobacco-free policies in the workplace and school to restricting tobacco advertising. The common thread in these approaches is the manipulation of environmental cues to discourage smoking.

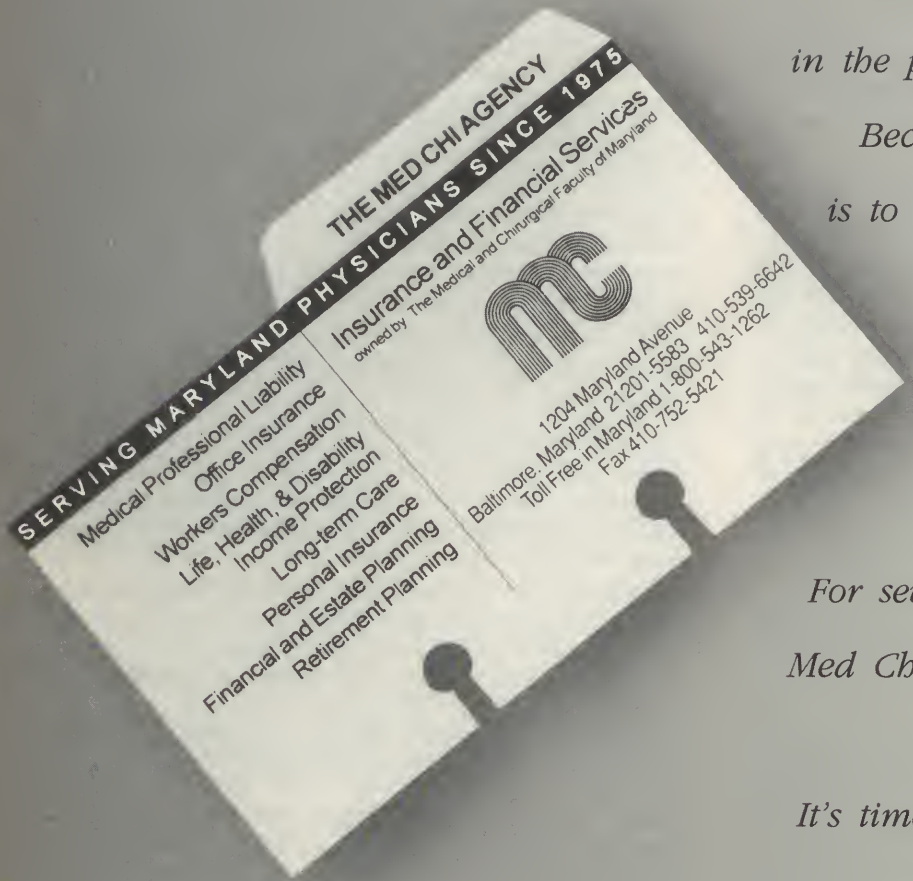
Smoking has lost its acceptance as a social norm. The surgeon general's 25th anniversary report noted that "the social acceptability of smoking in public is declining, as measured by the proportion of adults who find it annoying to be near a person smoking cigarettes. This proportion increased from 46% in 1964 to 69% in 1986." A once fashionable affectation promoted by celebrities, smoking is now widely regarded by both smokers and nonsmokers as a harmful addiction. Dr. Koop observed that "the ashtray is following the spittoon into oblivion."[1]

Tobacco-free policies accomplish several environmental smoking control objectives. Clearly, they reduce everyone's exposure to environmental tobacco smoke in schools, workplaces, hospitals, and other sites. In addition, these policies reinforce the social unacceptability of smoking by making smoking less apparent, and they may possibly help discourage some individuals from starting to use tobacco.[26] Since most smokers start in their teenage years, tobacco-free policies are especially important in schools. In Maryland, while state policy dictates that students may not smoke at school, only recently has the Maryland State Board of Education adopted a bylaw that will prohibit smoking by teachers, administrators, and staff.

One of the most pervasive environmental smoking control methods is the limiting of tobacco advertising. In 1985, the tobacco industry spent some 2.5 billion dollars on cigarette advertising; in 1986, the USDHHS spent only 39.5 million dollars on tobacco control. A recent theme issue of the *Journal of the American Medical Association* (*JAMA*) presented data leading to the conclusion that "cigarette advertising encourages youth to smoke and should be banned."[27] As already discussed in this article, advertising has a particularly strong effect on women. Several authorities have recommended limiting tobacco advertising to "tombstone" (unadorned) advertisements or point-of-sale advertisements. The anti-tobacco organization, Doctors Ought to Care (DOC),

goes a step further with its promotion of tobacco counteradvertising. DOC counteradvertisements parody well-known tobacco industry advertisements, pointing out that smoking is neither healthful, nor liberating, nor glamorous. DOC encourages physicians to avoid any unintentional endorsement of tobacco in their offices by subscribing to "smoke-free" magazines only. The *Maryland Medical Journal* February 1992 issue (page 119) lists such publications.

Host. Physicians can act upon the host to control smoking-related disease. All physicians should ask their patients if they smoke and they should record smoking status, recently termed "the new vital sign," in patients' charts.[28] Similar to vaccinating against infectious diseases, the physician can help nonsmoking patients by "psychologically inoculating" them against starting, by discussing with patients the adverse consequences of smoking, and by suggesting ways to resist cigarettes.[29,30]



Physicians can help patients to quit smoking by using a number of simple strategies developed by the National Cancer Institute (NCI). The NCI suggests the **"Four A's"**:

- ***Ask*** your patients their smoking status at each visit.
- ***Advise*** your smoking patients to quit.
- ***Assist*** them by setting a quit date, giving self-help materials, and prescribing nicotine replacement therapy (gum or patch).
- ***Arrange*** follow-up appointments.

In randomized controlled clinical trials involving 700 physicians and 40,000 patients, this intervention alone has achieved a 10% quit rate at one year, compared with a 4% quit rate in the nonintervention group.[31] More information on the NCI strategy entitled "How to Help Your Patients Stop Smoking" may be obtained by calling 1-800-4-CANCER.

HIV disease in pregnancy

Norman Levin, M.D.

Dr. Levin is chief of the Department of Obstetrics and Gynecology, Maryland General Hospital, Baltimore, MD.

The years from 1981 to the present have seen a steady increase in the incidence of AIDS in the female population. The corollary increase in the incidence of AIDS in pregnancy increases the responsibility of the obstetrician to become aware of the effect of AIDS on pregnancy and the effect of pregnancy on AIDS.

Increasing incidence of AIDS in pregnant women

During the next year, an American obstetrician is more likely to provide care for a woman infected with human immunodeficiency virus (HIV) than for an eclamptic woman, a pregnant woman with sickle cell disease, or a pregnant woman infected with congenital herpes.[1] In 1990, the Centers for Disease Control (CDC) reported 43,339 AIDS (acquired immunodeficiency syndrome) cases—17.2 per 100,000 population. Women accounted for 11.5% of reported AIDS cases among adolescents and adults.[2] This increase in the incidence of AIDS in the female population from 7% in 1987 has a corollary in the increase in the incidence of AIDS in pregnancy.

Maryland currently has the seventh highest cumulative prevalence rate of AIDS cases in the United States. In April 1991, the CDC reported the Maryland incidence of AIDS as 21.2% per 100,000 population. The proportion of women with AIDS is also increasing locally.[3]

Increasing responsibility of obstetricians/gynecologists

Maryland law states that physicians cannot decline patients because of HIV infection. The American College of Obstetricians and Gynecologists has stated that every obstetrician should be prepared to provide care for HIV-positive women.[1] Clearly, the time when an obstetrician/gynecologist can view HIV disease as an exclusive purview of subspecialists in infectious diseases has passed.

Every obstetrician should be aware that a retrovirus (RNA virus) that can be incorporated into the host genome causes this disease. It preferentially affects T4 cells, "helper lymphocytes," macrophages, and cells of the central nervous system. The T4 lymphocytes—the central component of the immune system—stimulate T8 cells to have a cytotoxic effect on pathogens and stimulate B cells to produce antibodies. When the T4 cells are depleted, B cells are no longer initiated to produce these antibodies.[4]

This virus can lead to progressive debilitation of the immune system,

rendering the individual susceptible to opportunistic infections—for example, *Pneumocystis carinii pneumonia*, central nervous system toxoplasmosis, and neoplasia, such as Kaposi sarcoma and rectal sarcoma—that rarely affect patients with intact immune systems. The HIV-infected patient with one of several opportunistic infections, such as neoplasia, dementia, or wasting syndrome, is diagnosed as having AIDS.[4] A seropositive woman with a CD4 of less than 200 mm^3 is diagnosed as having AIDS, even though she may be asymptomatic.[5]

Obstetricians/gynecologists must recognize the resulting changes in their responsibilities brought on by this disease. They must incorporate the safer sex message into routine reproductive health care because strikingly high rates of HIV seropositivity in the presence of sexually transmitted disease have implicated sexually transmitted disease as a risk factor. In one study, a repeated cross-sectional survey of prostitutes with HIV revealed a 50% incidence of gonorrhea and a 30% rate of chlamydia and hemophilus infections. While 22% to 25% of individuals became infected with gonorrhea after only one exposure, less than 15% of those with one exposure to HIV become infected, with the average infection rate being .3%.[6] Although HIV is poorly transmitted sexually, physicians should make clear to their patients that HIV is always lethal.

Obstetricians/gynecologists should introduce counseling and HIV-testing programs in their offices and clinics. They should advise a woman who may have been exposed to the HIV virus that she may need to be tested more than once since antibody detection may not be possible for several months after exposure. Standard testing procedures should include an initial immunoassay (enzyme-linked immunoabsorbent assay or ELISA) followed by a confirmatory Western blot assay. The physician should not consider a test positive without first performing a confirmatory test, particularly in low risk populations.

Physicians must report all persons with symptomatic HIV infection to the Maryland State Department of Health and Mental Hygiene.[7] Pretest and posttest counseling and written informed consent, using a form consistent with state regulations, must accompany serological tests for HIV. The provider has the option of reporting to the local health department persons who irresponsibly place others at risk for HIV infections.[7]

Obstetricians/gynecologists must provide medically appropriate, humane, and culturally sensitive care for HIV-infected women during pregnancy. As they become more involved with counseling and testing programs, obstetricians must prepare to manage the pregnancies of women identified through those programs.[1]

Antepartum testing and counseling

An obstetrician encountering a pregnant woman infected with HIV must ensure that she receive appropriate counseling to enable her to make an informed choice regarding continuation of her pregnancy and to reduce her chance of transmitting the disease to others. Counseling must include the discussion of the impact of the virus on the pregnancy, neonatal transmission rates, pregnancy complication rates, and the effect of pregnancy on HIV disease progression.

If a patient elects to continue her pregnancy, the obstetrician should tailor antepartum care to her particular needs. In addition to routine prenatal testing for chlamydia, gonorrhea, and syphilis, the patient should receive testing for hepatitis B virus infection, mycobacterium tuberculosis, cytomegalovirus infection, and toxoplasmosis.[8]

Treatment of HIV-related infections during pregnancy

The effects of HIV infection on pregnancy are not completely understood. Cell-mediated immunity is physiologically depressed during pregnancy, with a nadir at eight weeks before delivery and a rapid rise just prior to delivery. The HIV-positive status appears to prevent the rise in CD4 cells that occurs normally in the last eight weeks of pregnancy and during the puerperium. A CD4 count below 200 indicates that the parturient woman's health is in extreme jeopardy as is the well-being of the fetus. Ill effects to the fetus may occur as a result of the mother's advanced immunodeficiency state, causing an unfavorable fetal environment and promoting direct viral infection in the fetus.

The obstetrician should strongly consider the merits of abortion in terms of hazard to the fetus or the mother, given a seropositive woman with a reduced CD4 count.[9] At our institution, we have performed abortions, after consultation, for an unregistered HIV-seropositive patient 22 weeks pregnant, despite a standing policy of refusing abortion to anyone beyond 20 weeks of pregnancy.

An HIV-positive pregnant woman should have CD4 counts done at least once a trimester; the higher risk pregnant patient should have CD4 counts done monthly.[8] When a patient has a CD4 count of 500 to 200 or less, which places her and her fetus at risk for opportunistic infections, she should receive antiviral treatment preferably beyond the first trimester of pregnancy—the period of fetal organogenesis.

Clinicians should be leery of nonspecific symptoms that they usually attribute to pregnancy. If the patient develops an HIV-related infection, the obstetrician should coordinate treatment in consultation with infectious disease experts. Physicians should not rule out such therapeutic agents as AZT (zidovudine), trimethoprim, acyclovir sodium, and pentamidine when an HIV-related infection indicates their use. Although these drugs cross the placental barrier, and their long-term effect on the baby remains unknown, no valid studies demonstrate that they cause an increase in fetal abnormalities.[8] In the presence of a life-threatening situation, the obstetrician should not withhold treatment regardless of the duration of the pregnancy.

Transmission of HIV infection to the fetus

Transmission of HIV can theoretically occur via three principal routes. It occurs *in utero* by way of transplacental passage, or it may occur at the time of birth through exposure to

maternal blood and body fluids. HIV has also appeared in the breast milk, and some reported cases of transmission are thought to have occurred during breast-feeding. In these cases, maternal acquisition of HIV occurred postpartum.[10] For each patient with AIDS, there are at any given time 20 to 30 asymptomatic individuals who may presumably remain seropositive for life and may inevitably show symptoms of AIDS. Blood has the highest concentration of HIV virus, with amniotic fluid and semen also ranking high. Although other body fluids, such as saliva, urine, feces, and tears, are known to carry the virus, transmission via these fluids is extremely rare or questionable.[10]

Numerous studies have suggested a rate of perinatal transmission of HIV anywhere between 13% and 50%, with a higher rate of transmission for those patients who have symptomatic HIV infection than for asymptomatic patients. Reports place the African rate as high at 50%, in Europe about 13% to 14%, and in the United States somewhere in between.[4,10,11]

Intrapartum care

Intrapartum care should focus on the prevention of the nosocomial spread of HIV. The obstetrician should exercise caution and should minimize direct skin contact with potentially infected secretions. Universal infection control measures should include the use of water repellant gowns, goggles, gloves, and boots during all deliveries. Caregivers should clear the neonate's posterior pharynx with wall-suction or motor-suction devices. Caregivers should never resheathe, bend, or break needles before discarding.

The care in labor is not substantially altered for an asymptomatic HIV-positive woman. As with the symptomatic patient, the obstetrician should avoid direct contact between the infected mother's vaginal secretions and fetal blood. Scalp blood sampling for fetal pH evaluation and scalp electrodes for monitoring fetal heart rate during labor and delivery could theoretically enhance an inoculation of virus into the neonate. Therefore, a physician should rely on external fetal-monitoring devices only.

The obstetrician should consider delivery by cesarean section for obstetrical indications only. In 10 cases, cesarean sections made no difference in the incidence of HIV occurring in the infant; all mothers did well. According to Minkoff, these asymptomatic mothers had no complications, but their infants had a significantly high incidence of prematurity and low birthweight.[12] These fetal complications may be due to the lifestyle of the mothers—that is their high incidence of infection, their drug use, and their poor nutritional status—rather than their HIV seropositive state. Other studies have failed to demonstrate an adverse effect on infants delivered to asymptomatic seropositive mothers.

Postpartum care

Postpartum counseling should include advice about future sexual relationships. The physician should make a strong plea for the use of abstinence, non-insertive sex, or, at a minimum, the use of condoms as a means of birth control. The use of spermicidal agents, such as nonoxynol-9, further reduces the sexual transmission of AIDS.[8,10] The physician should caution patients that the use of intrauterine devices, birth control pills, and sterilization do not protect against the transmission of AIDS. Since breast milk has been indicated as a transmission mode for HIV, the obstetrician should recommend against breast-feeding for an HIV-infected mother. Cord blood will contain the detectable maternally produced immunoglobulin G antibody to HIV, and infants may retain this maternally transmitted antibody for up to 15 months.[8,10] Thus conventional testing is not useful, but early detection of viral specific immunoglobulin A antibodies perinatally leads to earlier diagnosis of HIV infection.[13,14] The mother and infant should receive further evaluation by a specialist in infectious diseases who has a strong interest in the problems of AIDS.[15]

Asymptomatic HIV seropositive women, identified because their children developed HIV-related disease, have been followed up to 24 to 28 months postpartum. Between 45% and 75% of these women developed symptoms—a higher rate than the 13% to 34% reported for antibody-positive homosexual men, intravenous drug users, or hemophiliacs who, when longitudinally studied for up to six years, have developed AIDS.[1] Hormones of pregnancy such as human chorionic gonadotrophin, estrogen, progesterone, alphafetoprotein, corticosteroids, prolactin, and alphaglobulin have immunosuppressive effects *in vitro* and may play a role in these statistics.[10,16–18]

HIV-infected children

The demographics of the pediatric AIDS population closely parallels that for women, with more cases occurring in African-American and Hispanic populations. As of April 1988, nearly 1,000 cases of AIDS in children under the age of 15 had been reported. Seventy-five percent of those children acquired the disease from their HIV-infected mothers, most of whom were either partners of intravenous (IV) drug addicts or were themselves IV drug addicts.[10]

Minkoff reported on 34 children with AIDS acquired as a result of a seropositive HIV mother. Few of the mothers (4 of 32) were symptomatic; however, low birthweight (11 of 34 preterm births) and premature rupture of the membranes were common.[12]

In Maryland, the results from a 1989 survey indicated that 42 of every 10,000 children born were HIV infected, representing a 35% increase over a similar survey in 1988. These results forecast double tragedies. Approximately 30% of these children will themselves be infected, and the overwhelming majority will lose their mothers long before they reach maturity.[3,19,20] According to Lindsay et al, unregistered inner city parturient women are significantly more likely to be seropositive for HIV than registered parturient women.[11]

The infected child has an extremely poor prognosis, particularly the infant who develops detectable clinical illness within the first six months of life. These babies rarely survive

beyond one year of age. Most newborns will develop symptoms within the first or second year of life although, according to reports, delays have occurred to age 11.[10]

Conclusion

The incidence of AIDS has steadily increased over the past decade in the general population and, more significantly for the obstetrician, among women of childbearing age. The obstetrician bears the responsibility of staying abreast of the ever-increasing knowledge of the effect of AIDS on these women, on the course of their pregnancies, and on their infants.

The history of brucellosis in Maryland and the District of Columbia

Henry V. Chase, M.D., F.A.C.P.

Dr. Chase is an internist from Frederick, Maryland

The history of brucellosis began in Europe; however, a number of early studies and publications originated in medical centers in Maryland and the District of Columbia. As a result of efforts by researchers in these locales, physicians came to understand the transmission of the disease, and continued clinical investigations helped to develop significant therapeutic and preventive measures that have made brucellosis a rare disease in the United States.

Brucellosis, characterized by fever, sweats, weakness, malaise and weight loss, is an infectious disease transmitted to humans from animals or animal products containing bacteria of the genus *Brucella.*[1] The disease also goes by the names Mediterranean fever, gastric intermittent fever, Malta fever, or undulant fever in humans; in cattle, it bears the name Bang's disease for the Danish veterinarian who isolated the bacteria that causes it.

The earliest records of brucellosis originated in Europe in the middle of the 19th century. The disease was not recognized in the United States until the beginning of this century when a number of early studies and publications originated in medical centers in Maryland and the District of Columbia. Scientists at Johns Hopkins, at the National Institutes of Health, and at Fort Detrick in Frederick County carried out significant investigations of brucellosis.[1] As a result of their efforts, the disease, which had become fairly common by mid-century, is now rarely encountered in this country.

19th century reports on brucellosis in Europe

The history of brucellosis began on the Isle of Malta where, in 1861, Assistant Surgeon J.A. Marston of the Royal Artillery Station, gave the first clinical description of the disease.[2] In his "Report on Fever (Malta)," he gave a long discussion of the febrile illness, naming the condition Mediterranean or gastric intermittent fever. He described the clinical picture and course of the disease in minute detail, and he clearly noted many of the complications encountered in a large series of cases.

Another important milestone in the history of brucellosis also occurred in Malta. In 1887, Assistant Surgeon David Bruce, stationed in Valetta, Malta, found the causal organism in the spleen of a British soldier who had died of the disease. Further study revealed that "In all cases of Malta fever, there was found a minute, berry-shaped bacterium" referred to as micrococcus melitensis.[3]

In 1895, Professor Barnhard Lauritis Frederick Bang, a veterinarian pathologist in Copenhagen, found the cause of infectious abortion in

cattle while studying a herd of cattle in Fredericksborg, Denmark.[4] He was able to culture a small gram-negative bacillus from the fetal envelopes of an aborting calf and, using noninfected cows, was able to fulfill Koch's postulate. This organism we now know as *B. abortus*.

W.W. Spink, I.F Huddleson, E.J. Young, M.J. Corbel, and, more recently, H. Mochmann and W. Koehler, have thoroughly reviewed the history of these 19th century European discoveries.[5–8]

Recognition of brucellosis in Maryland and the District of Columbia

In American medical literature, Dr. William Osler wrote the earliest discussion of brucellosis one hundred years ago in his *Principles and Practice of Medicine*.[9] Under the heading "Infectious Disease of Doubtful Nature," he noted that Bruce "has described the presence of a micrococcus in the spleen" as the cause. He also mentioned, "on the other hand, it held to be a fever due to chronic poisoning from fecal emanations."

In 1903, W.B. Bannister, an army surgeon stationed in Washington, DC, wrote the first case report of brucellosis in the American medical literature.[10] Having previously observed the disease while in the Philippines when a fellow surgeon developed the infection following a laboratory accident, his report concerned a soldier recently transferred from the Philippine Islands. The patient's history revealed that "a short time before taking to his bed with fever, he had been working with a culture of micrococcus melitensis in the army medical school laboratory."[10]

Examinations for malaria and typhoid proved negative. Quinine had no effect on the fever, but "the serum reaction, however, with the micrococcus melitensis was most decided as evidenced by marked agglutination."[10] Bannister did not obtain blood cultures as he believed at that time that the infection was confined to the spleen. Despite the history of exposure and positive specific serology, the author concluded that this case "was imported."[10]

During these early years of the 20th century, before specific antimicrobial therapy became available, treatment of brucellosis was symptomatic and empiric. In addition to the usual supportive measures, F.J.A. Dalton advised some form of febrifuge mixture or an intestinal antiseptic. He wrote, "I have generally found Burney Yeo's chlorinated quinine mixture the most suitable."[11] Empiric treatment included vaccines, chemicals such as neoarsphenamine, convalescent serum, brucellin, hyperthermia, whole blood, and sterile milk injections.

Also in 1903, C.F. Craig, like Dr. Bannister an army surgeon who had served in the Philippines, reported that he had received cultures of micrococcus melitensis through the courtesy of Professor William Welch of Johns Hopkins University.[12] Craig used these cultures in making the specific agglutination tests recently described by Almroth Wright and his colleagues.[13]

Two years later, in 1905, Dr. Craig reported the case of a a nurse who lived in the District of Columbia and worked in a local hospital. This patient developed the disease without any known source of infection. Dr. Craig suggested the probability of a much wider distribution of brucellosis and advised that the serum test be used in all cases of fever of unknown origin.[14]

Also in 1905, the voyage of the SS *Joshua Nicholson* led to a significant discovery about the transmission of brucellosis from animals to man.[6] Mr. G.F. Thompson, an agent of the Bureau of Animal Industry in Washington, DC, sailed to Malta to secure a herd of select goats to improve the "flesh and fleece" of the caprine industry in the United States.[6]

With three Maltese goatherds and 65 choice animals, Mr. Thompson left Malta in August 1905 on the SS *Joshua Nicholson* bound for Antwerp. The ship's captain reported that Mr. Thompson was ill on this voyage. On arrival in Antwerp, the goats were quarantined before boarding another ship, the SS *St. Andrew,* destined for New York. During the voyage to New York, at least four of the goats died, and, on arrival, the survivors were again quarantined at Athens, New Jersey; eventually all were destroyed due to infection.[6]

Passengers and crew members of both the SS *Joshua Nicholson* and the SS *St. Andrew* drank raw milk from the goats; many came down with fever during and after the voyage. Those who did not drink milk and a German chef who boiled his milk before drinking it remained well. Several months after the voyage, Mr. Thompson died of "influenza pneumonia."[6]

In 1911, E.C. Schroeder and W.E. Cotton of the Department of Animal Industry demonstrated the presence of *B. abortus* in raw milk.[15] While testing for the presence of bovine tubercle bacilli by injecting contaminated milk into guinea pigs, Schroeder and Cotton showed the pathogenicity of *B. abortus* for this specific laboratory animal.

The work of Alice Evans at the National Institutes of Health

Alice Evans, a bacteriologist on the staff of the Hygienic Laboratories of the United States Public Health Service and one of the most dedicated and productive workers in the field of brucellosis research, investigated the disease in humans and animals for over three decades. Previously assigned to the Dairy Division of the Bureau of Animal Industry, she began her work as one of the first women employed at the National Institutes of Health (NIH) in 1917.[16]

Since *B. abortus* and *B. melitensis* were both found in raw milk, Evans focused her attention on these two organisms. She noted morphological and biochemical similarities of *B. abortus* and *B. melitensis* and their similar staining reactions (gram-negative), which ordinary serum agglutination tests could not distinguish. Her experiments enabled her to form the concept that *B. abortus* found in cattle caused a form of brucellosis in humans. Evans gave credit to Dr. Adolph Eichhorn, a pathologist, for help in formulating this idea.[17]

Alice Evans presented her findings at the annual meeting

of the Society of American Bacteriologists held in Washington, DC in December 1917.[17] The results encountered skepticism, which persisted for seven years. Theobold Smith, a leading authority on the subject of human and bovine tuberculosis, "continued to deplore the confusion caused by what he considered hasty publication."[18] Even her colleagues at the Hygienic Laboratories did not believe in the accuracy of the results of Evan's investigation. (Dr. Harry Schoening confirmed this in a discussion at a meeting of the Bacteriological Seminar held at the University of Maryland on June 7, 1945.)[18] However, Smith subsequently changed his opinion and continued to encourage Evans in her research.

In 1922, Alice Evans developed a mild case of brucellosis following a laboratory accident. For nine months, repeated examinations failed to reveal any cause for complaints, and her physicians diagnosed neurasthenia. Subsequently, she experienced an acute episode, and a blood culture revealed *B. melitensis.* However, over the next five years, with admissions to four different hospitals for observation, the diagnosis of neurasthenia persisted. Finally, during an operation for another condition, lesions found at surgery produced a pure culture of *B. melitensis.*[18]

An early case reported from Johns Hopkins

Seventy-one years ago, Dr. Chester Keefer, while an intern on the Osler Medical Service at Johns Hopkins, recognized and later reported the first human case of brucellosis caused by a *brucella* species other than melitensis.[19] The patient (Med. No. 48513), a young technician in the medical school's Department of Histology, developed a clinical picture typical of brucellosis. His history revealed that he regularly consumed large quantities of raw milk and cheese. Immediately prior to the onset of his illness, he had transported several pig embryos from a local abattoir.

During hospitalization, 13 blood cultures over a period of 67 days all showed the presence of a small gram-negative bacillus. The bacteria resembled micrococcus melitensis morphologically, and specific agglutination reactions confirmed the diagnosis of brucellosis.

Dr. Keefer's report, published in 1924, masterfully describes the clinical course of the disease; his meticulous laboratory studies thoroughly document the diagnosis. Colonel C.F. Craig of the Army Medical School, who as mentioned had collaborated with Dr. William Welch of Johns Hopkins, supplied the serum and cultures that Dr. Keefer used to confirm the diagnosis.

Dr. Keefer's patient, while hospitalized, stimulated a great deal of interest within the faculty of Johns Hopkins. Florence Sabin of the Department of Anatomy, together with H.S. Amoss, a pathologist, contributed to several studies accomplished during the patient's hospitalization.[20] Sabin used the patient's blood for her classic supravital staining investigations. She noted that the brucella organism was a monocytic antigen. As a result, Dr. Amoss prepared an auto-vaccine, which the patient received at four- to five-day intervals. This enabled Sabin to comment: "The entire life cycle of the monocytic strain from the youngest of the dying cells could be seen in one preparation."[20] She also directly observed the monocytes role as a phagocyte.

Therapy during this period in this country and in Europe included use of Mercurochrome (merbromin) intravenously. This treatment met with no success.[21] In 1929, Dr. Benjamin Baker showed that brucella could cause intermittent hydrarthrosis.[22] He treated his patient with convalescent serum from Keefer's patient and "the improvement was striking."[22]

Dr. Amoss pursued his interest in the case, reporting in 1929 on his success at isolating brucella repeatedly from the patient's stool, as well as from his blood.[23] One culture (No.455) he sent to Alice Evans who eventually identified the organism as *B. suis.* This was the first human case of proved brucella infection other than melitensis. While at Hopkins and later at Duke University, Dr. Amoss isolated brucella from urine and bile; he obtained a pure culture from an ovarian cyst in a patient with chronic brucellosis who was operated on by Dr. Richard TeLinde.[24]

Also from Johns Hopkins, Charles Wainwright reviewed the subject of brucellosis at a meeting of the Southern Medical Association in 1928, and in a 1929 report, he added 11 new cases that had originated in Maryland.[25] He later employed neoarsphenamine in the treatment of the disease but found it ineffective.[26]

The 1930s: A Maryland epidemic and attempted therapies

W.R. Cameron and M. Wells reported that from 1929 to 1932, the health officer of Washington County, Maryland received reports of 46 cases of brucellosis.[27] Twenty-three patients lived in Hagerstown, and 23 resided on adjacent farms or in nearby small towns. They all drank raw milk and cream.

Epidemiological investigation traced the source of the infections to local dairies that sold raw milk and dairy products from infected herds. Investigators tested a total of 8,226 samples of milk serum from 38 herds; they found infection in 50% of the cows. In Hagerstown, a program to pasteurize all dairy products and eliminate infected animals proved successful, but similar measures failed in the rural areas.[27]

Research in this decade included a report in 1936 by Drs. Wainwright and L. Hamman. These investigators reported the results of their re-examination of 36 patients with long-continued, low-grade fever.[28] Eventually, 10 patients received an accurate diagnosis. Of these, three had chronic brucellosis. The report gave a detailed description of one of these cases.

In 1938, sulfanilamide was first used as therapy, and early forms of streptomycin and penicillin were tried with unfavorable results.[29]

World War II research at Fort Detrick

During World War II, Fort Detrick in Frederick, Maryland became a major center for brucellosis research. Work began

in November 1942 when the Chemical Warfare Service assumed responsibility for biological warfare research.[30]

Outstanding national and international scientists, both military and civilian, worked as full-time investigators and consultants "in the deepest wartime secrecy, matched only by that which enveloped the Manhattan Project for developing the A-bomb."[30]

After preliminary experiments on various pathogens, brucellae emerged as ideal candidates for use in biological warfare because of their high morbidity and low mortality rates, and a highly contagious nature. Investigators chose *B. suis* as the principal organism for possible development as an offensive weapon. Its relative ease of cultivation and capability to grow in primary isolation without increased carbon dioxide in its environment made it a suitable choice.[30]

From May 1944 to September 1945, investigators used a strain designated S (Huddleson 1882-A) in various experiments and field trials. Strain S1, derived from a single colony in 1920 and carried in serial transfer up to 1945 without genetic or colonial change, showed unusual stability. In addition, investigators used a genetically altered avirulent strain of *Serratia marcescens* to simulate *B. suis* in aerosol studies.[30]

Improved media allowed cultivation on a commercial scale without loss of virulence; specially designed equipment safely preserved the organism over long periods of time. Scientists produced large quantities of freeze-dried, concentrated brucellae in Pine Bluff, Arkansas, and they carried out field trials in Dugway, Utah.[31]

Scientists also directed much effort toward defensive measures to protect the armed forces and civilian population. They developed vaccines using ordinary media and yolk sac extracts of infected eggs. They instituted specific therapeutic trials with penicillin, sulfadiazine, and streptomycin, but none of these agents proved effective.[30]

Post-war studies and events

Although many scientific and clinical studies resulting from the wartime research appeared in medical literature, a large number remain classified. Neither the total number of completed studies nor their results may ever be known. However, several notable publications merit distinction as classics in the field of brucellosis research.

Included in this group is a 1947 report by G. Howe et al on 17 laboratory workers treated for acute brucellosis at the Station Hospital in Fort Detrick.[32] These workers, who contracted the disease early while engaged in investigative work, afforded a unique opportunity to observe the course of the infection from its onset and to observe the response to several chemotherapeutic agents in clinical trials. All of the patients had been thoroughly evaluated serologically and had been vaccinated prior to infection. Treatment again included penicillin, sulfadiazine, and streptomycin, used alone or in combination, again with no notable clinical response.[32]

In 1948, S.S. Elberg and D.W. Henderson, two senior investigators, for the first time documented the respiratory pathogenicity of brucella.[33] They used newly developed, sophisticated, aerosol methods to measure and deliver critical particle size, maintain virulence, and assure complete safety during the testing phase. The investigators concluded, "the respiratory route is little less effective than parenteral injections."[33]

From 1945 to 1956, in a well-planned three-part study, R.W. Trever, L.E. Cluff, J.R Imboden, and coworkers from Johns Hopkins, reported on the problem of chronic brucellosis.[34–36] They confirmed Spink's observation that chronic brucellosis occurs in a certain percentage of patients who recover from acute infection, but who continue with poor health for one or more years.[5] Their report analyzed in detail the cases of 60 laboratory workers who had contracted acute brucellosis at Fort Detrick from 1945 to 1956. Twenty-four of the original patients were available for follow-up study four to eight years after the acute episode. Sixteen of these patients had symptoms of poor health without any demonstrable physical abnormalities.[35]

The investigators gave a battery of psychological tests and psychiatric interviews to each member of the study. They concluded that the findings supported the view that emotional disturbance is the vital component of "chronic brucellosis" and is related to pre-illness personality structure and concurrent life situation.[36]

In 1944 and 1945, Alan Wood and Jack Guyton of the Wilmer Institute discussed the role of brucellosis in uveitis, and Wood reported five cases of nummular keratitis presumed due to brucella.[37,38] He produced "exactly similar lesions" in rabbits with local applications of live brucella organisms.[37]

Despite the skeptical reception that her findings had received in 1917, Alice Evans continued her investigations of brucellosis until her retirement from NIH in 1948. As already noted, she confirmed the first human case due to a brucella other than melitensis from a culture from Dr. Keefer's patient at Johns Hopkins. The first human case due to *B. abortus* came from nearby Clarendon, Virginia. Evans discussed her findings and her personal encounter with chronic brucellosis in her review, "Brucellosis in the United States," published in 1947.[18]

A second epidemic of brucellosis in Maryland occurred in Federalsburg on the Eastern Shore in 1946.[39] J.R. Steele and J.W. Hastings reported in 1948 on a two-month period in early 1946, during which 28 cases of brucellosis occurred. The authors state that it was the first large epidemic reported due to *B. abortus*. The source was raw milk from an uninspected herd of cattle. Certified milk usually sold by a local dairy became unavailable over the 1945 Christmas season, and raw milk from an uninspected herd of cattle caused the epidemic.

Therapy for brucellosis made great strides in the decade of the forties. In 1947, the two most promising antibiotics, Chloromycetin (chloramphenicol) and Aureomycin (chlortetracycline) became available almost simultaneously. Scientists at the University of Maryland and Johns Hopkins Hospital completed studies and published within a remarkable short period of 18 months.

In 1948, Byer et al, in early clinical trials of chlortetracycline, successfully treated a brucellosis patient. From the treatment of four additional patients, Byer and his colleagues concluded, "Laboratory and clinical observation in these five cases of brucellosis would suggest that Aureomycin is an effective chemotherapeutic agent in this disease."[40]

In a 1949 review of the benefits of chloramphenicol, Woodward described the treatment of eight patients who had acquired infection in Maryland.[41] All of the cases showed prompt and sustained clinical response. Five other patients received chlortetracycline treatment with similar results. Woodward concluded, "Slightly better results have been obtained in our hands with Chloromycetin [chloramphenicol] from the point of view of temperature response, with a mean fever duration of 2.4 days after beginning treatment."[41]

Also in 1949, in a report on the specific use of chloramphenicol in brucellosis, Woodward and Smadel pointed out Goodpasture's observation that brucellae are obligate, intercellular parasites that multiply within cytoplasm of the ectodermal cells.[42] This suggested chloramphenicol as an ideal therapeutic agent because of its ability to penetrate infected cells. Within a period of eight months, Woodward and Smadel were able to treat nine patients from Maryland with this antimicrobial. They achieved specific beneficial effect without an incidence of relapse.

Tetracycline remains the drug of choice in the treatment of brucellosis. Streptomycin or another aminoglycoside, as well as rifampin, may serve as an additive antibiotic.

Conclusion

Prior to 1925, the Centers for Disease Control (CDC) recorded a total of 128 cases of brucellosis in the United States.[43] In 1947, the CDC received reports of 6,321 patients, the peak incidence of reported cases. The year 1990 saw a total of 85 cases recorded, an incidence of 0.03/100,000.[44]

Pasteurization of milk and dairy products, together with the United States Department of Agriculture Eradication Program, have controlled brucellosis in this country almost to the complete disappearance of the disease in humans and in domestic animals, a notable accomplishment in the field of preventive medicine.

The diagnosis of brucellosis has become difficult because of its rarity and protean nature. A statement made by Keefer 70 years ago is appropriate today: "The infrequency of this infection in the United States and particularly in the East, the difficulties in the diagnosis of sporadic cases, and the importance of recognizing such cases seem to warrant this report."[19]

Giardiasis: A case report and discussion of outbreaks in the United States

Diane C. Malloy, Ph.D; Carmela Groves, R.N., M.S.N.; and David A. Schwartz, D.O.

Dr. Malloy is head of the Immunology Department at Maryland Medical Laboratory, Inc. Ms. Groves is chief, Division of Outbreak Investigation at the Maryland Department of Health and Mental Hygiene, Epidemiology & Disease Control Program. Dr. Schwartz is a practicing internist in Glen Burnie, Maryland.

Outbreaks of giardiasis occur every year in the United States, and waterborne infections appear to be increasing. Accurate identification of cases, proper hygiene in day-care and institutional settings, and adequate treatment of water sources will allow better control of this disease.

Case study

The patient is a 37-year-old female who had been in good health until July 1991 when she vacationed in the Bahamas. Approximately three weeks after returning home, she began to experience diarrhea, flatulence, abdominal distention, and cramping. These symptoms persisted along with episodic malaise, fatigue, and occasional headaches. Periods of wellness and normal bowel habits alternated with periods of malaise and diarrhea. When the patient presented in November 1991, the physical examination was normal. Laboratory examination of a formed, fresh stool sample revealed the presence of moderate numbers of *Giardia lamblia* cysts by wet mount examination and trichrome stain. White blood cells were not observed in the stool sample. The *Giardia lamblia* serum antibody test was positive with a titer of 1:32. The patient was treated with a seven-day course of metronidazole with subsequent resolution of symptoms.

Discussion

Giardiasis is the most common protozoal infection of the human intestinal tract.[1] It is well known that *Giardia lamblia* is a common agent of "travelers' diarrhea," and the case that is described above represents a common occurrence. Although many people are aware that only bottled or boiled water should be consumed when traveling to endemic areas, such precautions can be inconvenient for travelers.

Giardia lamblia is a flagellated protozoan that is found worldwide. While the prevalence is greatest in developing countries, it is also widely found in the United States. Prevalence rates in certain areas of the United States have been found to be as high as 16%.[1] There have been 95 outbreaks reported in the United States over the last 25 years, and the incidence appears to be increasing.[2,3] In Maryland, physicians and

laboratories are not required to report single cases of giardiasis. Therefore, the number of cases of giardiasis that are reported to the Maryland Department of Health and Mental Hygiene (DHMH) underestimate the true incidence of disease. In 1990, 58 cases of giardiasis were reported to the Maryland DHMH; in 1991, 89 cases were reported; and 15 cases were reported in the first quarter of 1992. Outbreaks of giardiasis are, however, reportable, and from January 1990 to March 1992, four outbreaks were reported in Maryland.

Giardiasis is most frequently acquired through consumption of contaminated water. In one of the recent Maryland outbreaks, a wading pool was suggested as the source of infection. Several outbreaks in the United States have been traced to the use of surface waters that were treated by faulty purification systems or by inadequate chlorination without adequate filtration.[3] In Vermont, where the incidence of giardiasis is higher than in other reporting states, infection rates were found to be elevated at higher elevations where water supplies are difficult to protect from contamination.[4] Untreated mountain stream water can transmit giardiasis to hikers. In 1983, an outbreak occurred among a group of students and faculty participating in a geology field course in Colorado who had consumed untreated stream water at their campsite.[5] In this outbreak, 31 of 40 people who consumed the stream water developed giardiasis.

Food sources have been documented in a few outbreaks of giardiasis.[6] A recent outbreak occurred in southern New Jersey, where 9 of 25 people who attended a family party contracted giardiasis.[7] The source of infection appeared to have been contaminated fruit salad. Health department investigators discovered that the person who prepared the fruit salad had a child in diapers, as well as a pet rabbit at home—both of whom were positive for *Giardia lamblia.* Taco ingredients were implicated as the source of infection in a 1988 outbreak among a church youth group in Albuquerque, New Mexico.[8] It was speculated that the vegetable ingredients of the tacos may have been washed with contaminated water or that the individual who prepared the tacos may have contaminated the food during preparation.

Person-to person transmission has received increasing attention recently, with outbreaks occurring in day-care centers, schools, and other institutional settings.[9,10] In two of the recent Maryland outbreaks, person-to-person transmission was identified as the mode of transmission in household/day-care settings. In Minnesota, 88 cases of giardiasis occurred in a six-week period among residents and employees of a nursing home and day-care children participating in an "adopt-a-grandparent" program.[10] There was a significant association between illness and physical contact with the day-care children, suggesting person-to-person transmission. In addition, transmission by food seemed to have occurred, since there was a strong association between sandwich consumption and illness, whereas individuals on a puréed diet were not infected. Person-to-person transmission may occur quite readily, due to the fact that as few as 10 organisms are required to establish an infection.[11] Along with other parasitic intestinal infections, giardiasis can be sexually transmitted through the oral-anal route. The incidence of animal-to-human transmission is not known; however, recent studies have shown a high prevalence of *Giardia lamblia* in domestic dogs and cats.[12]

Diagnosis

Giardiasis should be strongly suspected in a patient who develops symptoms between one and four weeks after returning from an endemic area. Other forms of travelers' diarrhea, such as that caused by enterotoxigenic *Escherichia coli,* have a much shorter incubation period. The diagnosis of giardiasis should be considered in any patient who has a history of prolonged diarrhea, malabsorption, or weight loss, regardless of travel history. Microscopic demonstration of the organism in stool, duodenal fluid, or a jejunal biopsy specimen clearly establishes the diagnosis. Detection of *Giardia* in stool samples in the laboratory is optimized through cyst concentration techniques. However, due to the intermittent pattern of cyst excretion, this approach will not detect all infections. These techniques will typically identify *Giardia* in only about 50%–60% of patients, even when multiple stools are examined. It is important to recognize that continued negative stool examinations do not rule out *G. lamblia* as the causative agent. Duodenal fluid examination may be indicated when stool examination does not reveal the presence of the cystic form of the parasite. The Entero-Test (Health Development Corp., Palo Alto, California) is a commercially available device that facilitates "string test" sampling of duodenal contents. This device consists of a gelatin capsule containing a string that is taped to the patient's cheek. The patient swallows the capsule, the capsule dissolves in the stomach and the string reaches the jejunum within approximately four hours. The string is then pulled out through the mouth, and the attached mucous is examined microscopically for trophozoites. Direct detection of *Giardia* antigens in feces can now be performed by enzyme immunoassay, and this has demonstrated greater sensitivity than microscopic methods.[13] Specific DNA (deoxyribonucleic acid) probes for *Giardia* have been developed.[14] However, these have not yet been applied to routine diagnosis.

An indirect immunofluorescent assay (IFA) test is available for the detection of serum antibodies to *Giardia.* Most patients with giardiasis produce significant levels of antibody, and titers may correlate with the duration of infection.[15] The predictive value of a negative result is excellent; however, a low positive titer cannot be interpreted as diagnostic, since many uninfected individuals may possess cross-reactive antibodies.[16]

Treatment and prevention

Treatment is recommended in acute cases as well as in asymptomatic carriers. Quinacrine hydrochloride is the most effective drug for treatment of giardiasis and is given in doses of 100 mg three times a day for seven days for adults and 2

mg/kg three times a day for children.[17,18] The cure rate with quinacrine is 90% to 95%. Common side effects include intestinal upset, headache, and yellowing of urine. Less frequently, nausea, vomiting, diarrhea, fever, and rash may occur. In approximately 1.5% of adults, toxic psychosis occurs. Metronidazole yields a lower cure rate (85%–95%), but is better tolerated than quinacrine.[17–19] Metronidazole is given in doses of 250 mg three times a day for seven days for adults and 5 mg/kg three times a day for seven days for children. Side effects include gastrointestinal symptoms, darkening of the urine, and opportunistic overgrowth of *Candida* in the bowel. Taken with alcohol, both quinacrine and metronidazole can give a disulfiram (Antabuse)–like effect. The cost of seven-day regimens of quinacrine or metronidazole are currently approximately $12.00 and $7.00, respectively. Furazolidone is available in liquid form, and is therefore useful for infants and young children. It has an efficacy of 75% to 90% when given in a dosage of 1.25 mg/kg four times a day for seven days.[19] Side effects include gastrointestinal symptoms and mild hemolysis in G6PD-deficient individuals. All of these drugs are regarded as being potentially unsafe in pregnancy. When treatment becomes necessary in a pregnant woman, however, the high cure rate of quinacrine makes it the drug of choice. All patients should be evaluated for cure by testing three stool specimens approximately one month after completion of treatment.

While there is evidence that over-the-counter bismuth subsalicylate (Pepto-Bismol) has a protective effect against some bacterial agents of travelers' diarrhea,[20] there are currently no measures available for *Giardia* prophylaxis.

Control of waterborne giardiasis relies upon proper management of surface waters, and federal regulations mandate that surface waters be treated to achieve at least a reduction of 10^{-3} of *Giardia* cysts.[21] High standards of water purification methods, including sedimentation, filtration, and chlorination of water sources, will ensure minimal risk to populations. The US Environmental Protection Agency has recommended that an acceptable level of safety for drinking water is one that ensures a maximum yearly risk of infection of 1 in 10,000, and a model has been developed that facilitates the estimation of this risk after consumption of water containing varying levels of *Giardia* cysts.[3]

Maryland is currently enforcing federal drinking water regulations, set forth in the Maryland Code of Regulations, Quality of Drinking Water. The Surface Water Treatment Rule applies to unfiltered public water supplies and requires filtered supplies to meet stringent turbidity and disinfection criteria.[21] Compared with other states, Maryland has fewer unfiltered surface water supplies: only seven supplies are unfiltered (all located in western Maryland), and no water supplies in large cities are unfiltered. Public water systems that use surface water and those that use ground water under the influence of surface water must either install filters or must meet criteria that will avoid filtration. For example, if raw water quality is high, disinfection alone may be sufficient to achieve an adequate reduction in *Giardia.*

Routine testing for water quality in Maryland does not include testing for *Giardia.* Lack of experience and equipment in both the field and the laboratory can contribute to the difficulties in recovering *Giardia* from water samples. To test for *Giardia,* large amounts (a minimum of 100 gallons) of water must be passed through a micropore filter before sending the filter to the laboratory for further washing, extraction, and examination. Since 1989, none of the 94 water samples processed in the DHMH Microbiology Laboratory have yielded *Giardia;* however, only small amounts of water and no filters were submitted.

Public education efforts are needed to inform the public of practices that can minimize the spread of infection. Travelers to highly endemic areas should avoid consumption of tap water, uncooked foods, and foods that may have been prepared in contaminated water, and campers should boil drinking water for 10 minutes before consumption. The spread of infection through day-care settings presents a major problem. Day-care workers and parents of young children in day-care settings need guidance on standards of hygiene practices. Accurate diagnosis and treatment of infected individuals are critical, and more sensitive approaches to the detection of the organism may permit better control of giardiasis.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

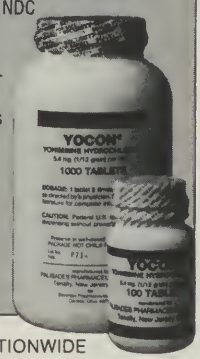
Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.



Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

The homes of the Medical and Chirurgical Faculty of Maryland

Joseph M. Miller, M.D.

Dr. Miller is a retired surgeon from Timonium, Maryland.

Through its almost 200-year existence, the Med Chi Faculty has met in numerous locations in Annapolis and Baltimore. The building at 1211 Cathedral Street has been its home for 84 years.

The approach of the bicentennial of the Medical and Chirurgical Faculty of Maryland (1999) invited a retrospective glance at the sites that have been Med Chi's home during the last two centuries. Interestingly, the first serious attempt at organization was a call to the physicians of the state to meet at Stark's Tavern in Baltimore in December 1789.[1-3] Preliminary discussions led to a charter by the state, and the first formal meeting of the Faculty in Annapolis—probably in one of the two legislative halls there.

Regular assemblages then took place on a biennial schedule in Annapolis. In 1805, the place of meeting was transferred to Baltimore

Figure 1. The cornerstone of the Athenaeum was laid in 1824, and a Faculty meeting was held there in 1827. Burned in 1835, the structure was subsequently rebuilt. (From *Picture of Baltimore.* Baltimore: F. Lucas, 1832. Courtesy of the Enoch Pratt Free Library of Baltimore.)

and, as interest in the Faculty grew, annual conventions were initiated in 1817. Early on, sessions were held wherever a suitable hall could be found: Williamson's Hotel; Mr. Barney's Hotel; the University of Maryland; the Athenaeum (**Figure 1**); and the saloon of the law building among others. (The word "saloon" may need further definition as it may also mean a hall for meeting.)

The problem of a satisfactory meeting place overshadowed all other business at the convocation in 1857. A suitable site had been found at 47 North Calvert Street (**Figure 2**) and because the acquisition of the house was accepted by the group, its purchase was authorized. In 1858, the Faculty assembled for an epoch-making event—its first meeting in its own hall.

A lethargic syndrome affected the Faculty during and immediately after the Civil War. Meetings were not held and transactions were not published. Because Calvert Street had become a major north-south artery, it was not considered satisfactory for the quiet and composure needed for reading, meetings, and courses of instruction. Accordingly, the house was sold in 1867, and the property at 60 Courtland Street (**Figure 3**) was acquired in September 1869. Events inaugurating the occupation of the new home were held one month later. This change revivified the Faculty.

Figure 3. The house on the hill was too small to have a room for a library.

The building proved to be a bad meeting place, however, because its location on the steep slope from Calvert Street to Charles Street made entrance difficult, particularly in winter. The convention of 1874 was the last one held in the Courtland Street house.

(Those readers interested in a more detailed study of the local geography will not find Courtland Street on present day maps. The street ran between Franklin Street on the north and Lexington Street on the south. When the Preston Gardens were created in the period of 1914 to 1919, the east side of St. Paul Street and the west side of Courtland Street were razed, and the new area was called St. Paul Street and St. Paul Place.)

A subsequent move was made in 1874 to a hall on the second floor of a building on the north side of West Fayette Street, a few doors removed from Park Avenue. The new rooms were later found too small "to accommodate the very valuable library and to display periodical literature."

In June 1878, a "well-lighted, neatly furnished, and easily

Figure 4. Hopkins Hall, on the old campus of the Johns Hopkins University, was the site of many meetings. (Figure used with the permission of The Ferdinand Hamburger, Jr. Archives of the Johns Hopkins University.)

leased. (Annual meetings had been held here on several previous occasions.)

Convocations were held (1879–1884) at the Johns Hopkins University, which was not too far away at North Eutaw and West Monument Streets (**Figure 4**). In 1885, the hall in the Athenaeum Building (northwest corner of St. Paul and East Saratoga Streets) (**Figure 5**) was again used as it had been in the early career of the Faculty because the increasing demands for space led to a denial by Hopkins. The lower floor of the Athenaeum Building was subsequently leased as another home, and meetings were held there through 1895.

At a special session in March of that year, the Faculty decided that its best interests would be served if a permanent site in a section of the city more accessible to the majority of the members could be found. The purchase of a three-story dwelling on North Eutaw Street was recommended. Although the initial choice was for 839, the house at 847 (**Figure 6**) was bought, at it was thought to be a better site. Soon after the purchase, necessary and extensive remodeling was undertaken. The old buildings at the rear of the property were torn down, and a large assembly hall extending from the main building back toward Linden Avenue was erected. Occupancy occurred in January 1896.

The space could not have been entirely desirable because in April 1908, the trustees announced that a building lot had been found on Cathedral Street near Preston Street. Hopes for a more permanent home were consummated in May 1909 when the new building at 1211 Cathedral Street (**Figure 7**) opened for occupancy. The Faculty has called this site home now for 84 years.

The passage of almost two centuries between the organizational meeting in Annapolis and the present time have seen a firm rooting of the Faculty, with a resolution of many diffi-

a firm rooting of the Faculty, with a resolution of many difficulties with which it was besieged in its first century of existence. The initial gathering looked toward improvement in the quality of medicine without thought to a home. This desire has been accomplished, while the Faculty has also seen the creation of a better and more permanent domicile.

CLINICOPATHOLOGIC CONFERENCES at Johns Hopkins

BELUR S. BHAGAVAN, M.D., Editor
RICHARD R. GRAHAM, M.D., Associate Editor
ROBERT A. VAN WESEP, M.D., Associate Editor

A 37-year-old man with diabetes mellitus, renal transplant, fever, pulmonary infiltrates, and mental status alterations.

Participants: Alan J. Watson, M.D.; Andrew Yang, M.D.; Jean L. Olson, M.D.; and Sheldon I. Bastacky, M.D.

PRESENTATION OF CASE

A 37-year-old white male with a 21-year history of insulin-dependent diabetes mellitus complicated by retinopathy, peripheral neuropathy, and end-stage renal failure received a cadaveric renal transplant.

The post-transplant course was complicated by the development of a peritransplant hematoma in the right iliac fossa and acute rejection. The hematoma was treated conservatively, and the acute rejection was treated by an increase in steroid dosage. Three days following discharge, the patient experienced sudden onset of severe right iliac fossa pain associated with shortness of breath and palpitations.

General findings. Upon admission to the emergency room, physical examination showed that the patient was in mild distress. The pulse was 110/min, blood pressure was 220/110 mm Hg, the temperature was 37.4°C, and respirations were 20/min. Skin examination was normal. Head, eyes, ears, nose, and throat (HEENT) examination showed diabetic retinopathy and poor dentition. The lungs were clear to auscultation and percussion. Auscultation of the precordium showed a grade III/VI systolic ejection murmur, loudest at the left sternal edge and radiating to apex. Abdominal examination revealed a healing right iliac fossa incision and right iliac fossa tenderness. There was a right forearm arteriovenous (AV) shunt. Neurologic examination was normal.

The past history was remarkable for diabetes mellitus and early cataracts. Family history was positive for diabetes mellitus and coronary artery disease. The patient lived in Baltimore with his wife and two children. He was a nonsmoker and nondrinker. The patient had a cat at home.

Medications on admission included insulin, Catapres (clonidine hydrochloride), Tenormin (atenolol), minoxidil, Imuran (azathioprine), prednisone, and cyclosporine.

Lab values. On admission, laboratory values were as follows: sodium, 143 mEq/L; potassium, 5.8 mEq/L; chloride, 111 mEq/L; bicarbonate, 23 mEq/L; blood urea nitrogen, 50 mg/dl; creatinine, 2.4 mg/dl; glucose, 359 mg/dl; hematocrit, 26.1%; mean corpuscular volume, 93.9; red blood cell distribution width (RBC-DW), 17.3 (normal 11.5–14.5); white blood cells, 10,300/mm^3; platelets, 539,000/mm^3; prothrombin time, 12.8 sec (1.1 x control); and partial thromboplastin time, 17.6 sec (0.7 x control).

A chest x-ray showed cardiomegaly without infiltrates. An electrocardiogram showed sinus tachycardia (104/min), normal QRS axis, T-wave inversions in leads I, AVL, and V5-V6.

Hospital course. Exploratory laparotomy revealed a recent and organizing hemorrhage around the transplant kidney, arising from a pseudoaneurysm at the site of the renal artery anastomosis. The hemorrhage was evacuated, and the vascular anastomosis was repaired using pledgets. Cultures of the hematoma were positive for *Staphylococcus epidermidis* and *Enterobacter aerogenes*, which were treated with intravenous gentamicin and vancomycin therapy. A subsequent abdominal computed tomography (CT) scan demonstrated reaccumulation of a large fluid collection, which was aspirated under ultrasound guidance. Cultures of the fluid were positive for a resistant streptococcal species, prompting addition of imipenem.

The patient underwent repeat laparotomy following the onset of fever with rigors, at which time two infected pledgets were removed and a new hematoma was evacuated. Culture of the hematoma was positive for *Staphylococcus epidermidis* and group D enterococcus.

Evolving mental status changes in the setting of an antibiotic refractory fever prompted a cranial CT scan and lumbar tap, both of which were unremark-

From the Johns Hopkins School of Medicine, Departments of Medicine, Pathology, and Radiology where Dr. Watson is associate professor of the Renal Division; Dr. Yang is instructor in radiology; Dr. Olson is associate professor of pathology; Dr. Bastacky is postdoctoral fellow in pathology; Dr. Bhagavan is associate professor of pathology; Dr. Graham is lecturer in pathology; and Dr. Van Wesep is lecturer in pathology.

able. A cerebrospinal fluid (CSF) cryptococcal antigen assay was negative. Cytomegalovirus (CMV) serology titers were positive, but no baseline values were available.

Four weeks after admission, the urine, throat, and surgical wound cultures were growing *Candida albicans,* and amphotericin B was started. Two days later, the patient developed acute respiratory failure with bilateral pulmonary infiltrates, disseminated intravascular coagulopathy, hemodynamic instability, and obtundation. Sputum legionella direct fluorescent antibody test was negative. The patient expired following cardiopulmonary arrest, and a complete autopsy was performed.

DISCUSSION

Dr. Alan J. Watson: The case Dr. Olson has chosen for us this morning is a complicated one. In sum, the patient was a 37-year-old man whose past history was most remarkable for a long period of insulin-dependent diabetes mellitus complicated by retinopathy, peripheral neuropathy, and a nephropathy. He developed end-stage renal disease, which required regular hemodialysis for 14 months prior to receiving a cadaveric kidney transplant. The process was complicated by the development of a slowly expanding hematoma in and around the transplant and questionable rejection. Both were treated, and the patient was discharged. Three days after discharge, he developed a sudden onset of severe right iliac fossa pain associated with tachypnea and tachycardia. His past history was also significant for other complications of diabetes, cataracts, and a vitrectomy. Family history was positive for diabetes mellitus. From the social perspective, he lived in Baltimore with his family; he had a cat. His medications included a variety of agents to treat his hypertension and diabetes, and immunosuppressant agents to prevent rejection of the allograft.

When he was admitted, the notable clinical features were a temperature of 37.4°C, tachypnea, tachycardia, and hypertension. In addition, there was tenderness to palpation in the right flank and pelvic area.

Laboratory values were remarkable for a serum creatinine of 2.4 mg/dl, a white blood cell count that was at the upper level of normal at 10,300/mm^3, and normal coagulation parameters. A chest x-ray showed mild cardiomegaly without infiltrates. Electrocardiogram showed nonspecific changes.

At this point, I would like to consider the differential diagnosis as our surgical colleagues would have pondered over it in the emergency room. The patient presented with pain and tenderness over the allograft. The first and foremost consideration in this setting is the potential for acute graft rejection. Available effective treatments to reverse rejection and to preserve kidney function make early identification of this complication important. Acute allograft rejection may present with fever and evidence of fluid retention, which this patient did not have. Another consideration in the differential diagnosis is urinary leak. Since ureteric anastomosis at the time of transplantation often results in a disruption of the blood supply to the lower ureter, necrosis can ultimately occur, and a urinary leak may develop. Superimposed infection will result in a painful swelling in and around the transplant.

When I first read Dr. Olson's summary, I thought this patient had developed an allograft rupture. This uncommon but serious complication of renal transplantation tends to occur if ongoing rejection causes the kidney to become swollen. The typical clinical features include sudden onset of exquisite pain, tenderness over the graft, swelling, and shock as a result of a rapidly expanding hematoma. The importance of considering this diagnosis is that immediate laparotomy with drainage of the hematoma and

Figure 1. Coronal T1 weighted image showing transplant kidney in right iliac fossa and small perinephric fluid collection.

Figure 2. Transverse T2 weighted image showing transplant kidney in right iliac fossa and perinephric fluid collection (arrow).

suturing of the kidney in many circumstances saves the graft.

Next in the differential diagnosis is the possibility of infection. One of the key predisposing factors to pyelonephritis is an abnormal anatomy of the urinary tract as is the case with a transplanted kidney.

At this stage we will consider radiologic evaluation of the patient.

Dr. Andrew Yang: Approximately one week post-transplant, a coronal T1 weighted MRI (magnetic resonance image) of the transplant kidney in the right iliac fossa demonstrated good corticomedullary differentiation. One can see patency of the ipsilateral iliac arteries and veins. There was a small perinephric fluid collection **(Figure 1).**

A week later, this perinephric fluid collection had increased in size. The corticomedullary differentiation of the transplant kidney remained. There was also no evidence of swelling of the transplant kidney as seen by the presence of renal sinus fat.[1]

In order to differentiate between the various causes of fluid collection in the post-transplant period, we did other pulse sequences. The fluid collection, instead of brightening, darkened on the T2 images, suggesting the presence of hemosiderin **(Figure 2).** This is compatible with a hematoma rather than an abscess, although we could not tell whether the hematoma was infected. A CT scan done one week later showed a continually expanding perinephric fluid collection.

Three weeks later, a drain had been placed, and the perinephric fluid collection had disappeared.

A Doppler ultrasound study of the segmental artery flow in the transplant kidney initially revealed a fairly high diastolic/systolic ratio **(Figure 3A).**

A week later, the diastolic/systolic peak velocity ratio had decreased **(Figure 3B).** This finding is not specific for rejection, but could be seen in other causes of poor renal function.[2,3] In summary, the radiographic changes were compatible with hematoma in the perinephric area, but there was no evidence of marked rejection.

Dr. Watson: Given these radiologic findings and the clinical considerations, our surgical colleagues opted to undertake an exploratory laparotomy, which identified a hematoma around the transplant kidney. The source of this was believed to be a pseudoaneurysm at the site of arterial anastomosis, which was repaired. Cultures of the hematoma grew *Staphylococcus epidermidis* and

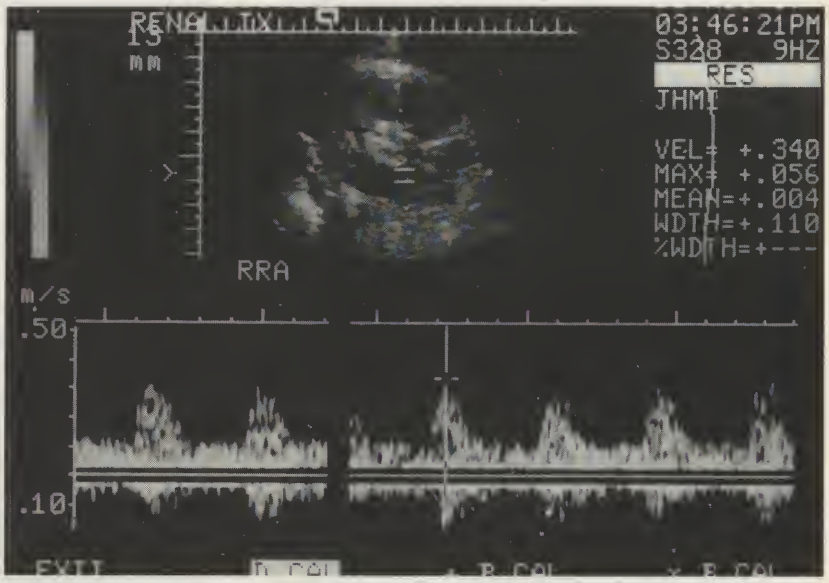

Figure 3A. Doppler ultrasound study of segmental artery flow in the transplant kidney showing high diastolic/systolic velocity ratio.

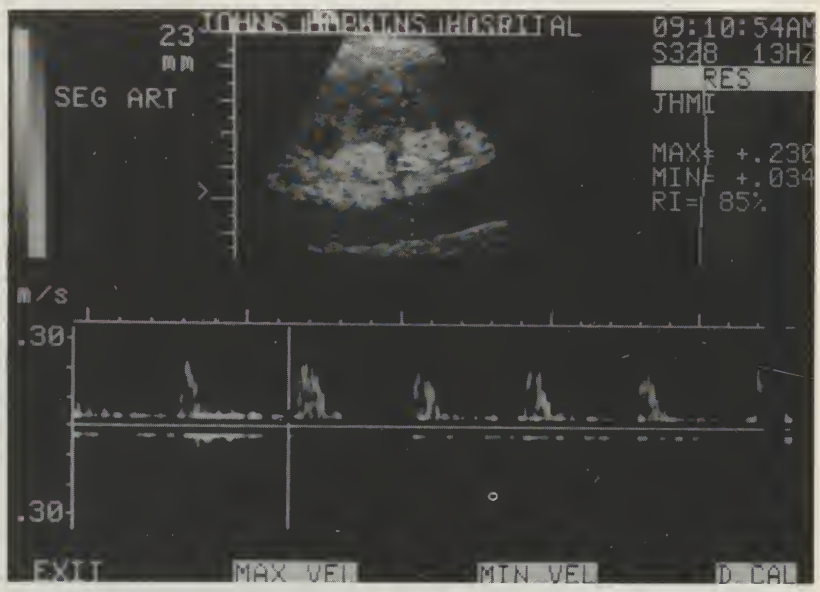

Figure 3B. Doppler ultrasound study of segmental artery flow in the transplant kidney, one week after the study shown in **Figure 3A.** The diastolic/systolic ratio has decreased.

Enterobacter aerogenes; broad spectrum antibiotic therapy was initiated. Subsequently, the fluid collection reaccumulated, was aspirated, and was again found to contain streptococcal species. Further antibiotics were added.

The patient underwent a repeat laparotomy following the onset of fever with rigors. Two infected pledgets, thought to be the cause of the problem, were removed. A new hematoma was evacuated, which also grew out various organisms. Thereafter, the patient entered into the second phase of his hospital course, characterized by refractory fevers persisting in the face of very broad spectrum antibiotic coverage and accompanied by an alteration in mental status. On reviewing the chart, clearly these mental status changes were significant, and, in fact, for the last five to six days of this patient's life, he was semi-comatose. CSF examination was unremarkable; in particular, a cryptococcal antigen assay of the CSF was negative. CMV serology titers were positive, but unfortunately, we do not have any baseline data available.

Candida albicans was recovered from the urine, the throat, and the surgical wound. On this basis, amphotericin B was initiated. Three days later, the patient became acutely ill, developing respiratory failure with bilateral pulmonary infiltrates, a coagulopathy, hemodynamic instability, and worsening of his altered mental status. He expired the next day, following a cardiac arrest.

Dr. Yang: A baseline chest x-ray showed some very mild cardiomegaly, but otherwise normal lungs. As late as five days before death, there was no evidence of infiltrates within the lungs, and the heart size was normal.

However, four days later, one began to see some cardiomegaly or pericardial effusion with development of nonspecific bilateral interstitial infiltrates in both lungs **(Figure 4).** There was no evidence of hilar adenopathy. A differential in an immunocompromised patient includes opportunistic infections due to viral pneumonia such as CMV, which would have more basilar infiltrates; toxoplasmosis, which may present with a pattern like this; and *Pneumocystis carinii,* which has a fine interstitial pattern.[4,5]

One day later, the infiltrates had increased in both lungs, predominantly in the mid lungs bilaterally. The heart was slightly enlarged, but otherwise unchanged.

After insertion of the Swan-Ganz catheter, the heart size decreased slightly. There was accentuation of alveolar pattern and slight increase of interstitial infiltrates. The differential diagnosis at this point included acute respiratory distress syndrome (adult respiratory distress syndrome) superimposed on an interstitial infection.

Dr. Watson: Encapsulating this second phase of the hospitalization, which was the terminal illness, the patient had a fairly rapid onset of fever and a pneumonic process in the face of broad-spectrum antibiotic therapy. The patient also experienced an alteration in mental status, progressing to the state of complete obtundation. Dr. Yang described a subtle and progressive increase in heart size. The chart contains an assessment of the creatinine phosphokinase enzymes and the MB fraction. So I have included inflammation of the heart (i.e., myocarditis) as perhaps another facet of what I believe is an infectious process in this immunocompromised patient. I use the term myocarditis loosely because patients with diabetes mellitus and patients with end-stage renal disease have a high incidence of atherosclerotic disease, which can affect the coronary arteries and predispose to myocardial ischemia.

On reflecting on the history of transplantation and the associated mortality, one can see that in the early 1960s, there was a very high mortality rate.[6] As time went on, and immunosuppressive agents, particularly azathioprine and prednisone, were regularly used, the success rate rapidly improved. More important, the mortality rate progressively fell, and as transplant physicians and surgeons gained more experience, and newer antibiotics were developed, this mortality rate fell further.[7] It is important to note that the very high mortality rate associated with septicemia and pneumonia has also fallen to a low level. However, although deaths as a result of infection have progressively fallen, we should not presume that infection is not a problem in immunocompromised transplanted patients; we must constantly remain vigilant of the potential for infection.

Where are the common sites of infection in a renal transplant patient? As I mentioned before, the urinary tract is anatomically abnormal and the

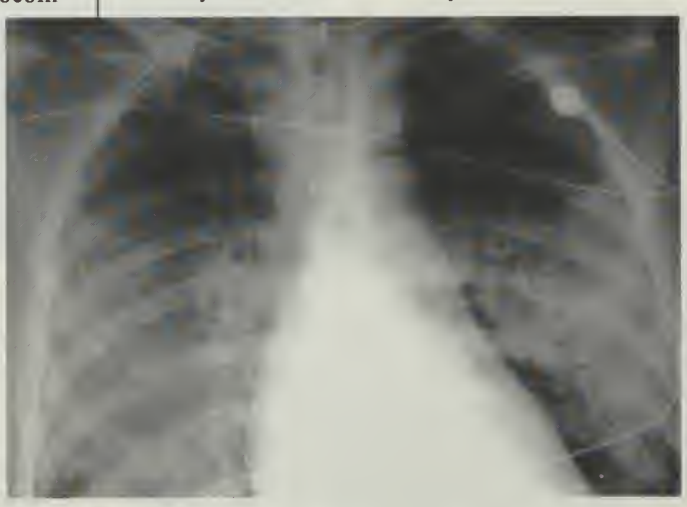

Figure 4. Chest radiograph showing enlargement of cardiac silhouette and nonspecific bilateral interstitial infiltrates.

incidence of urinary tract infection is high.[8] This makes avoiding the use of catheters imperative in such patients, particularly in the postoperative period. Pneumonia accounts for some 20% of infection, septicemia is common, and wound and cannula site infection account for over three-quarters of the infections we see in a transplant patient. More important, they account for some 25% of the overall mortality.[9] The majority of infections are due to various bacteria, although viral infections and fungal infections account for almost half of the opportunistic infections.[10] Protozoa, particularly *Pneumocystis carinii,* make up some 5%.[10] Mixed infections occur in 30% of cases. For example, *Pneumocystis* may accompany a cytomegalovirus infection, or a cytomegalovirus infection may complicate a bacterial pneumonia.

When faced with a renal transplant patient with a fever, there are four major considerations. The first is the recognition that there is a defective immune system. In particular, there is a defect of the cell-mediated arm of the immune system, which predisposes to a wide range of organisms—opportunistic infections. The second important consideration is the time of infection relative to the time of transplantation, an important point to which I shall return.

The third consideration is epidemiologic factors, such as the geographic locale. For example, in the midwestern United States, there is concern over histoplasmosis, and in the southwest, coccidioidomycosis. We must also consider exposure potentials with herpes virus. In fact, we routinely tell our transplant patients to avoid, at all costs, any friend or relative who develops herpes simplex or herpes zoster infections. The fourth consideration is the site of infection as identified by our clinical examination and subsequent test. For example, cryptococcosis tends to localize in the central nervous system (CNS); whereas, *Pneumocystis carinii* tends to affect the lungs.

In considering the temporal relationship, dependent upon the time after transplantation, one can see clustering of infection with a particular organism.[10] I will use this framework as an approach to this particular patient.

The first organism to consider is CMV—one of the most common infections in the renal transplant recipient. It tends to occur most frequently a month or two after transplantation, just around the time that our patient became ill.[10] Many of us have been exposed to CMV, which might appear as a subacute, cold-like illness or a fever for a day or two. A diagnosis is confirmed only by looking for the presence of antibodies to CMV in the blood stream. But many transplant candidates on dialysis have not been exposed to this virus. In such patients, very serious infection with CMV can occur, characterized by fluctuating high fever and depression of bone marrow function manifested by leukopenia and thrombocytopenia. There may be a pneumonitis, a hepatitis with marked transaminitis, an alteration of mental status due to encephalopathy, and gastrointestinal hemorrhage due to mucosal ulceration. This organism has a predilection for the cecum and the colon and can produce exsanguinating hemorrhage through ulceration.

In many cases, CMV comes from blood transfusions, but it can be transmitted with the allograft since the allograft contains leukocytes that contain the organism.[11] Chest x-rays show diffuse infiltration, and blood gas analysis and pulmonary function tests identify a major disturbance of pulmonary function. However, x-ray findings and even the clinical signs on examination can often be very misleading. Often, the diagnosis rests with Dr. Olson and her colleagues in the examination of biopsies of various tissues to identify the characteristic intracellular inclusion bodies.

I considered CMV first of all, and certainly many of the features our patient demonstrated fit the diagnosis of CMV, but we did not have any knowledge about prior exposure. We did know an antibody titer was positive but could identify no evidence of bone marrow suppression or hepatitis. For those reasons, I put aside the diagnosis of CMV and considered other infectious possibilities.

Pneumocystis carinii, a once almost forgotten organism, has experienced recent renewed interest because 70% of pulmonary infections in patients with acquired immunodeficiency syndrome (AIDS) are caused by *Pneumocystis carinii.*[12] Presenting features include shortness of breath and a nonproductive cough, but physical examination is often very unremarkable as is the chest x-ray in which very subtle interstitial changes are the rule. However, pulmonary function studies usually demonstrate a major disruption of pulmonary physiology. The diagnosis is facilitated by early bronchoscopy, bronchoalveolar lavage, and transbronchial biopsy if necessary. Use of special stains identify the organism, which responds promptly to high dose intravenous trimethoprimsulfamethoxazole. On occasion, the organism produces a very devastating lung lesion with cavity formation and pneumothorax. However, *Pneumocystis carinii* infection tends to localize to the lung and would not account for a systemic infectious process. Infection by various fungi must also be considered. Aspergillosis, occasionally seen in the transplant population, occurs more often in patients who are granulocytopenic, especially in those who have been granulocytopenic for considerable periods of time and who have received many antibiotics. Pulmonary involvement is characterized by a virulent necrotizing pneumonia. In fact, individuals who have this pulmonary infection are prone to expectorate

large quantities of infarcted lung. This very dramatic clinical feature emphasizes the nature of this infection and reflects that the pathophysiologic process at work is one of pulmonary infarction. In the case of multi-organ infection, the clinical manifestations are those of multi-organ infarction. It tends to be a very insidious disease, difficult to diagnose early. In general, by the time it is diagnosed, it has reached the multi-organ dissemination phase. I do not believe this patient had Aspergillus since the onset was rapid, and the pneumonic process did not appear to be typical of that fungal infection.

What about candidiasis? I mention this because of the finding of *Candida* in several sites. In our case, we have to postulate disseminated candidiasis with involvement of the eye, the kidney, the liver, and the heart. Because pneumonitis is a very uncommon feature of *Candida* infection, I do not believe the individual had systemic candidiasis although I think that the selection of amphotericin as a treatment at that time was probably a correct one. Since we can culture the organism rapidly, we can easily diagnose candidiasis, but on occasion we have to resort to tissue diagnosis.

We have had an interest in the last few years in various fungal infections in transplant patients. We have had 11 cases of cryptococcal disease in our institution since transplantation began, which is the largest single series of *Cryptococcus neoformans* infection in transplant patients.[13] It tends to be a subacute or chronic disease, and, in the majority of patients, it occurs well after transplantation. The major site of infection is the CNS presenting as a subacute or chronic meningitis. Lumbar puncture with assessment of cryptococcal antigen is a very sensitive test. It was negative in our patient. It is unusual to have isolated cryptococcal disease of the lung, and when it occurs, it tends to appear in isolated infiltrates and not as a diffuse process as in this patient.

We have also had experience with a number of patients with mucormycosis in this setting. A literature search and review of this entity indicates that the vast majority of affected patients have diabetes mellitus.[14] Most of the patients present with a rhinocerebral form of mucormycosis, characterized by an erosive, destructive sinusitis, which usually requires urgent debridement. Pulmonary lesions are nodular and ultimately progress to form a dramatic cavitary lesion. We also must consider agents such as nocardiosis and toxoplasmosis. Nocardiosis, characterized by a pneumonic process in 75% of cases, has a peculiar propensity to develop pleural effusions, which our patient did not have. There also may be intracerebral mass lesions.

To this point, we have dealt with three of the four major considerations necessary in the assessment of the febrile transplant patient. We recognized that the individual is immunosuppressed and prone to infection by a variety of opportunistic infections, and we have considered many of those. We have taken into consideration the time after transplantation; we have considered the site of the infection. This individual had a CNS process, a pneumonic process, and, perhaps, a process affecting the heart. We have yet to consider the fourth consideration—various epidemiologic factors.

On review, a very important point appears in the social history. The patient lived at home not only with his family but with a cat. The significance of this observation is the fact that the cat is a definitive host for the protozoa *Toxoplasma gondii*. When a cat is infected, several phases of protozoal maturation occur within the gut. The cat excretes infectious feces containing oocysts, which can result in the infection of a variety of animal species and humans. In the vast majority of cases, exposure to *Toxoplasma* in an immunocompetent individual is not of major concern; however, it is of great concern to two categories of people. The first is pregnant women, particularly in the early stages of pregnancy, who when exposed to toxoplasmosis can pass the infection on to the fetus, and the child may be born with congenital toxoplasmosis. The second group of people is the immunocompromised such as our patient—the renal transplant patient on immunosuppressive drugs. In such a patient, disseminated toxoplasmosis can occur. The clinical features of this disease are fever, lymphadenopathy, various skin rashes, a pneumonitis, which is very similar to pneumonitis caused by the cytomegalovirus, and myocarditis.[15] It may also cause a frank meningitis or an encephalitis in addition to mass lesions of the cerebrum. While this individual had a negative lumbar puncture, a review last year of cases of toxoplasmosis affecting the CNS in patients with AIDS identified that in many of these patients, the lumbar puncture was, in fact, negative. So, this negative test does not preclude a diagnosis of toxoplasmosis; nor does the negative unenhanced CT scan negate this diagnosis. An enhanced CT scan can accurately identify mass lesions. The patient had unenhanced CT scan, and no dye was given because of the concern that the radiocontrast dye might prove nephrotoxic to the graft.

I believe that in this individual who was immunosuppressed, exposure to a cat resulted in exposure to *Toxoplasma gondii*, which produced a disseminated disease resulting in a pneumonia with a superimposed adult respiratory distress syndrome. Toward the end of his life, there was a CNS process, probably an encephalitis and/or a meningitis and perhaps the early development of a myocarditis.

The Sabin-Feldman dye test confirms the diagnosis, although a brain biopsy may also be needed. The treatment is pyrimethamine and sulfonamide.

I would like to emphasize three points in summary: first, consideration of the time of onset of infection relative to the time of transplantation; second, the approach to the febrile transplant patient and particularly the importance of a detailed history; and third, consideration of epidemiologic factors. If physical examination, tests, and cultures do not clarify the etiology of the pneumonic process quickly, bronchoscopy and bronchoalveolar lavage, biopsy, and special stains to identify various opportunistic infections should be used aggressively. Assessment of CSF in patients with an alteration in mental status or focal neurologic signs is of great importance, and one should look for fungi with, for example, the India ink stain for cryptococcus and should use the cryptococcal antigen test. Perhaps we ought to obtain baseline titers (cytomegalovirus titers and antibodies to toxoplasma) prior to transplantation, to make a comparison titer more meaningful should a patient develop an acute febrile illness.

In the absence of a prompt diagnosis, the mortality rate in all of these types of infections increases dramatically. Thus, it is important to recognize the need for rapid diagnosis of a particular infection in a given patient to allow for early institution of appropriate therapy.

Dr. Watson's diagnosis:
Toxoplasmosis of lung, brain, and heart.

Dr. Jean L. Olson: Examination of the native kidneys revealed end-stage diabetic nephropathy with large Kimmelstiel-Wilson nodules, diffuse increase in mesangial matrix, and marked thickening of the capillary loops. There were extensive hyalinosis lesions, which is an accumulation of plasma protein within the capillary loop, and also some hyaline arteriosclerosis.

As Dr. Watson mentioned, the patient had been on dialysis for 14 months prior to receiving the transplant. This is reflected in an almost uniform intimal proliferation of arteries that occurs when patients are on dialysis.[16]

Now, what happened to the hematoma? Examination of the transplant kidney itself failed to reveal any evidence of infection. Granulation tissue with foreign body giant cells was present in the soft tissue surrounding the transplant, but no evidence of any active infection was noted, excluding the hematoma, as a source of the fever at the time he died. The transplant did show some very mild acute rejection as manifested by mild proliferation with intimal inflammatory cells in an arcuate artery. The patient also had evidence of acute tubular necrosis (ATN) based on both the presence of mononuclear cells within the vasa recta, and also uniform dilation of proximal tubules. The ATN was probably due to overwhelming sepsis at the time of his death.

The patient had been receiving large doses of corticosteroids and other immunosuppressive agents, and that was reflected in the adrenal gland by marked atrophy of the cortex of the adrenal gland and loss of the lipid and by tubular change, particularly noted in the zona glomerulosa. These alterations show that he was effectively immunosuppressed.

His tongue showed a superficial infection by *Candida* organisms with both yeast and pseudohyphal forms (**Figure 5**). The presence of pseudohyphae indicates active infection. Since this was the only location where we found *Candida,* it was strictly of the mucocutaneous type with early invasion and was not the cause of his death.

Scattered small remote granulomas were present in the lung, liver, and spleen. Their size suggested that in the past, the patient may have had histoplasmosis. There was no evidence of any kind of acute change or reactivation of these granulomas.

Examination of psoas muscle, which is easily accessible at autopsy, showed a cyst with organisms. The differential diagnosis is histoplasmosis versus toxoplasmosis. Since this patient also had small granulomas, histoplasma was a serious consideration. There were many more cysts within the heart. We did not find any evidence of myocarditis in our sections. Special stains aid in the differentiation between toxoplasmosis and histoplasmosis. Histoplasma should stain with periodic acid Schiff reaction. These were negative, but when we used Giemsa stain (**Figure 6**), the *Toxoplasma* organisms

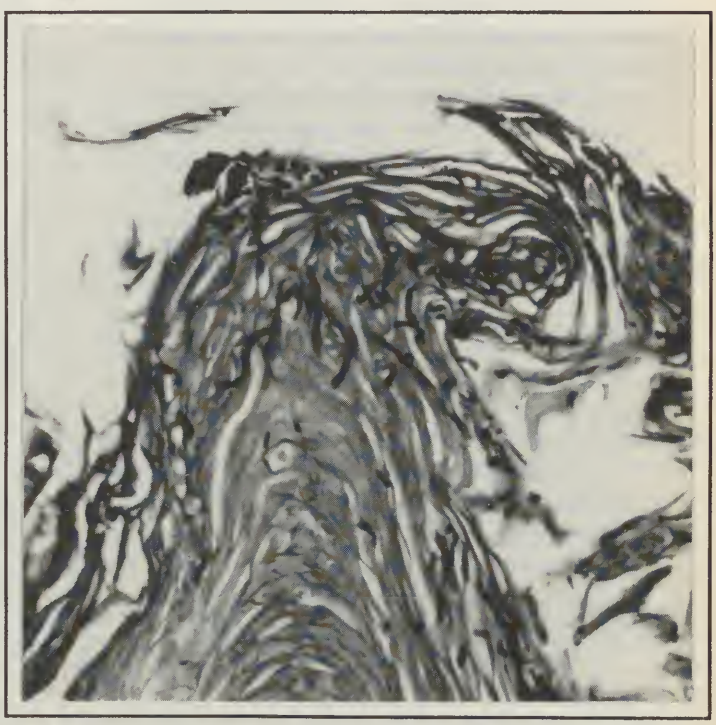

Figure 5. Light micrograph showing yeast and pseudohyphal forms of *Candida* organisms invading superficial epithelium of tongue. (Methenamine silver, X 400).

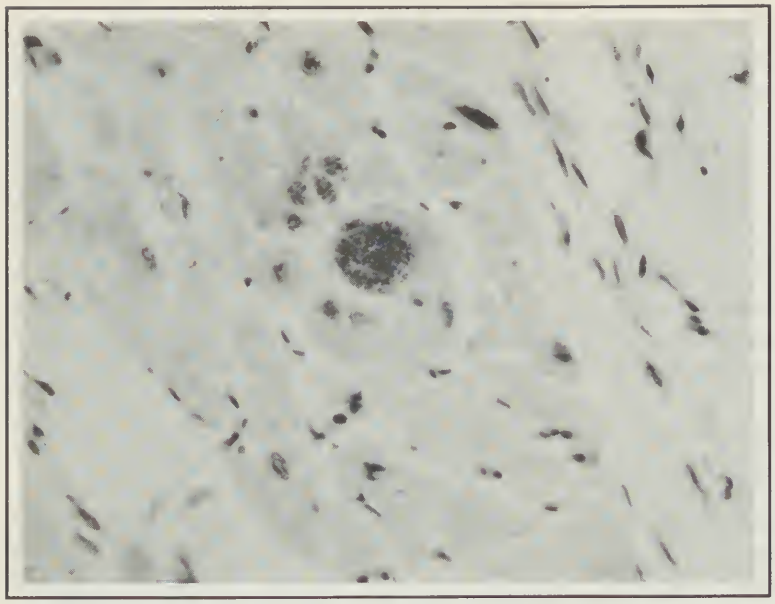

Figure 6. Light micrograph of heart showing several neighboring myocytes containing cysts with *Toxoplasma* bradyzoites. (Giemsa, X 340).

were easily seen. When they are encapsulated in the cysts, they are called bradyzoites because they grow slowly. When the individual organisms are confined to the cysts, as in the heart and skeletal muscle of this patient, that indicates infection some time in the past.

The two places where there was evidence clinically and also at autopsy of infection were the lungs and the brain. In some areas of the lung, there was not much evidence of infection. Rather there was a proliferation of the type 2 cells and the occurrence of hyaline membranes, supporting a diagnosis of adult respiratory distress syndrome, which contributed to the terminal event.

Other areas of the lung showed an alveolar infiltrate with necrosis and scattered neutrophils **(Figure 7).** Cysts containing the bradyzoites were identified. But in addition, some cysts ruptured so that organisms escaped and became tachyzoites, which means they can multiply quickly. Immunocompetent hosts who have been previously infected with *Toxoplasma* can destroy such organisms, which may escape from the cysts. However, in an immunosuppressed patient, the tachyzoites can cause progressive lesions as probably happened in this patient. His lungs had a diffuse infection with *Toxoplasma.* The organisms were very easy to find and were usually in areas where there was an inflammatory infiltrate. The infiltrate was muted because the patient was immunosuppressed, but it was present. He was responding, but inadequately, to the proliferation of these organisms in the lung.

Examination of brain showed a spectacular meningitis with white, thickened meninges over both frontal lobes. Microscopically, one could see thickening of the meninges and a few inflammatory cells. There were no organisms present in the meninges.

On cut section of brain, meningeal thickening was quite pronounced. In addition, there were scattered small lesions. Since they measured only 3 to 4 mm, it would be difficult to pick them up on most routine CT scans.

Microscopic examination of the brain revealed glial nodules in virtually every section of brain. Several microscopic foci were much too small to be picked up by any radiologic procedure. Glial nodules have a long differential diagnosis. In cases in which such nodules are infectious, one has to be able to identify the organism itself. In this case, particularly, in those nodules that showed necrotic centers, cysts containing *Toxoplasma* organisms were noted **(Figure 8).** On occasion, one could find cysts with small tachyzoites breaking out, indicating progressive *Toxoplasma encephalitis.*

Our anatomical diagnosis on this patient was disseminated toxoplasmosis involving the lungs, brain, skeletal muscle, and heart. Stored serum was available for serologic tests. His *Toxoplasma* titer three years before his fatal illness was 1:16. One year later, his titer had risen to 1:185. A fourfold increase indicated that there had been an active infection. Additional findings included superficial candidal infection, mild acute rejection of the transplant kidney, and diabetic nephropathy in the native kidney.

Toxoplasma gondii was first described in 1908 and first seen in a human in 1923. The first docu-

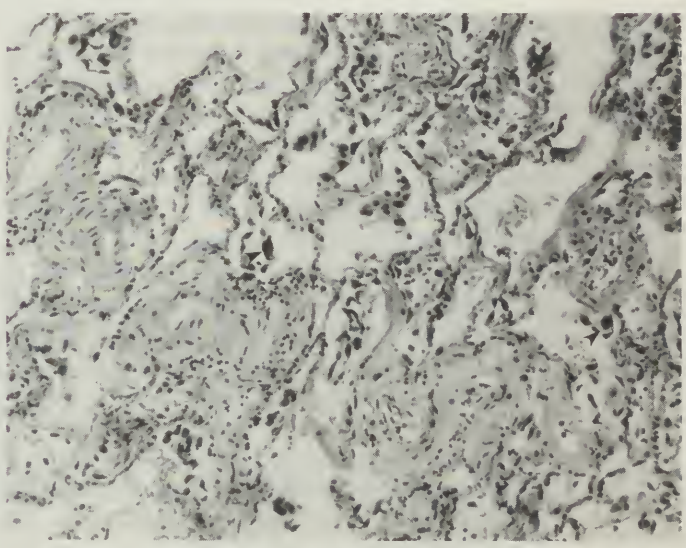

Figure 7. Light micrograph of lung showing patchy interstitial fibrosis and cuboidal alveolar lining cells. Rare lining cells contain *Toxoplasma* organisms (arrowheads). (Hematoxylin–eosin, X 200).

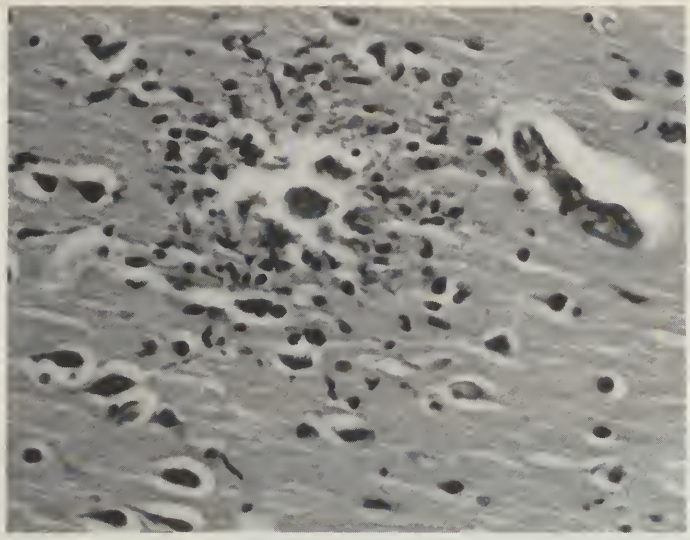

Figure 8. Light micrograph of brain showing glial nodule with macrophage containing *Toxoplasma* organisms. (Hematoxylin–eosin, X 310).

mented congenital transmission of the organism was in 1937. The first serologic test was in 1948, and the first recognition of an association with cats was in 1970.[17] Toxoplasmosis in the immunocompromised host frequently indicates reactivation of disease by cysts that rupture and an inability of the host to curb the infection.[15,18] Disseminated disease usually results. The course is often fulminant with death in only a few days to a week or two as was illustrated in this patient.

We should address the question of how this patient got the disease. Several different possibilities exist. The first possibility is reactivation of latent disease. We know the titer rose from 16 to 185. Thus, an inability to handle organisms from ruptured cysts because of the immunosuppression may have resulted in dissemination. The disease possibly resulted from an acute infection picked up from the family cat exacerbated by defects in cellular immunity. A final possibility for the origin of the organisms is an infected allograft.

Anatomical diagnosis:

Disseminated toxoplasmosis involving lungs, brain, skeletal muscle, and heart. Tenfold rise in *Toxoplasma* titer between 1986 and 1987 (time of transplant).

April 29 - May 1, 1993

PREVENTION '93-
MARYLAND

University of Maryland
University College Conference Center
in College Park

Watch the *Maryland Medical Journal* for more details.

Imaging Case of the Month

A 42-year-old male patient complained of right shoulder aching discomfort that was exacerbated by the use of the arm at or above the shoulder level, sometimes interfering with sleep.

Physical examination showed a tenderness over the greater tuberosity and the anterior edge of the acromion. A painful arc (45° to 120°) was present. No history of trauma was noted. The patient was referred to magnetic resonance imaging (MRI) for evaluation of the rotator cuff, following a conventional radiograph of the right shoulder.

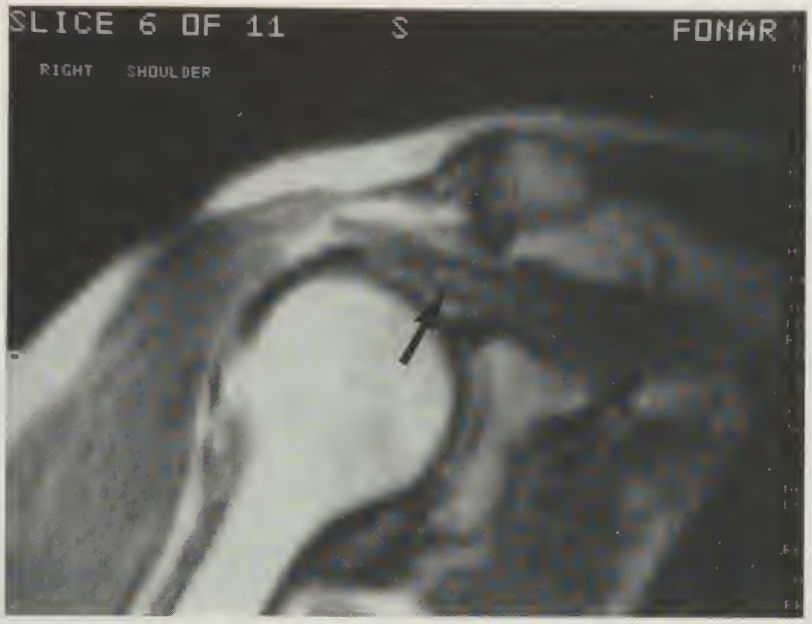

Figure 1.

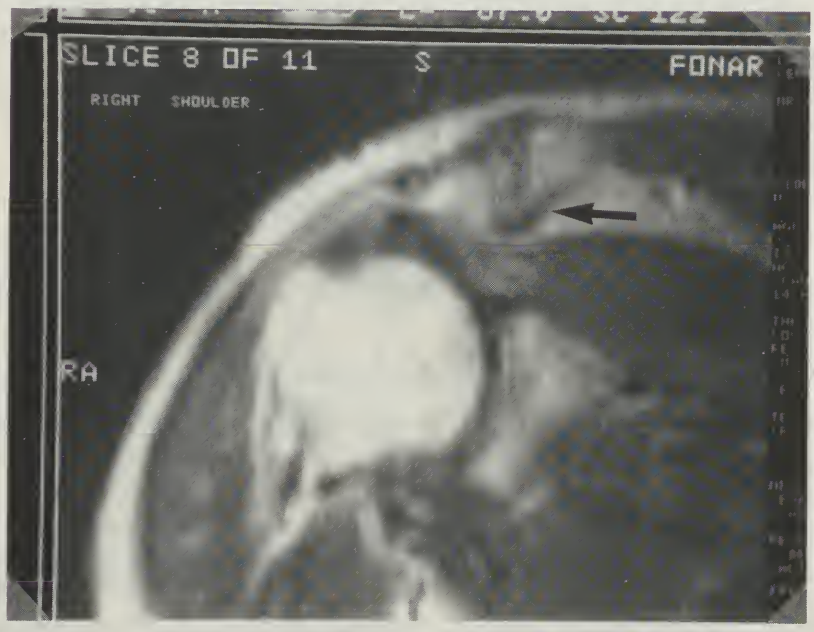

Figure 2.

Impingement syndrome

Figure 1. A 42-year-old male patient with impingement syndrome. Short TE (echo time) oblique coronal image shows increased signal intensity area in thickened supraspinatus tendon (arrow) and indistinct margins, indicative of tendinitis.

Figure 2. Long TE oblique coronal image reveals no fluid in the subacromial bursa. Acromioclavicular joint osteoarthritis with spurring (arrow) is well demonstrated, impinging the superior surface of the supraspinatus tendon.

The impingement syndrome is an important cause of shoulder dysfunction.[1] Impingement is commonly secondary to

a. Low-lying anterior acromion process that narrows the space between the anterior acromion and the humeral head.

b. Callus or osteophytes on the inferior surface of the acromion or acromioclavicular joint.

c. Thickening of the coraco-acromial ligament, which traps the rotator cuff between bony eminences.

Most rotator cuff tears develop in response to chronic microtrauma in the form of mechanical impingement. The common pathway for the various forms of shoulder impingement is mechanical irritation of the rotator cuff by hard, bony projections (callus or spurs underneath the low-lying acromion or acromioclavicular joint).[2]

Impingement syndrome is divided into three stages:[1] Stage I of Neer's classification occurs in symptomatic individuals less than 25 years of age and is associated with hemorrhage in the critical zone of the supraspinatus tendon. Stage II occurs between ages 25 and 40 and is associated with rotator cuff tendinitis, secondary to chronic trauma. Stage III occurs after 40 and is associated with frank cuff tears.

Tears most often occur in the critical zone, a poorly vascularized section of the rotator cuff located between the anterior acromion and the humeral head. According to Neer, 95% of cuff tears are associated with chronic impingement syndrome.[3]

MRI offers an accurate and sensitive measure for evaluating acromioclavicular joint impingement. It clearly shows indentation of the superior surface of the supraspinatus tendon by callus or spurs. The subacromial and subdeltoid fat pads are usually obliterated when significantly impinged upon.[2]

More reliable indications of clinical pathology are secondary changes within the supraspinatus tendon, depicted as thickening and increased signal intensity within the tendon (tendinitis) on short TE (echo time) weighted images. According to Crues, three MRI findings have been reliable indicators of a complete rotator cuff tear:

1. Proximal retraction of the musculotendinous junction of the supraspinatus tendon.
2. Liquid in the subacromial bursa.
3. Liquid collection interrupting the rotator cuff.[4]

MRI has quickly become an important modality in the delineation of the rotator cuff tears. Compared with arthrography, it is noninvasive and shows not only intra-articular and bone disease, but bursal, soft tissue and bone marrow abnormalities as well. Compared with sonography, MRI is not operator-dependent, and the criteria for the examinations of the rotator cuff tear seem to be clearer.[5]

PHYSICIAN AUTHORS WANTED

"Imaging Case of the Month" is a regular feature of the *Maryland Medical Journal*. Coordinated by the Maryland Radiological Society, the cases presented provide a review of a broad range of diseases and pathological processes of interest to a wide range of specialists.

Physicians interested in submitting cases for publication consideration should contact the deprtment editor:

Edgar C. Fearnow, M.D. c/o Drs. Schultze, Snider & Assoc., P.A.
Suite 100, 21 Crossroads Drive, Owings Mills, MD 21117

What to look for in Office Computers

Target audience: Physicians and office managers
Date: Saturday, March 13, 1993
Time: 9 a.m. - 2 p.m.
Location: Med Chi Building,
1211 Cathedral St., Baltimore, MD
Offered by: Computers in Medicine Committee,
Rafael Haciski, M.D., F.A.C.O.G., chairperson
Faculty: Physicians experienced in computer use

Description: Three-part seminar intended for physicians and their office staff who do not yet have computers and who need guidance in the selection of equipment and software, as well as those who have systems in their office but are looking to change or expand.

The first part will review **computerizable office functions** and various examples of software to meet those functions. All demonstrations will be on actual computer equipment.

The second part of the seminar will address **hardware requirements**, based on software and practice size.

The third part will consist of a **question and answer segment**, as well as time for **hands-on experience**.

WORD ROUNDS

Bart Gershen, M.D.

Chiromancy

It was the afternoon of a recent Council meeting. A motion had just passed encouraging the application of adhesive labels to waiting room magazines. The labels were to express Med Chi's rejection of all cigarette advertisements contained within. A member then rose to suggest that we should explain to our patients who the Medical and Chirurgical Faculty is by adding parenthetically to the sticker ("Medical Society of the State of Maryland").

The physician seated next to me leaned over and whispered, "What the hell DOES *chirurgical* really mean?"

Abruptly—as did Belshazzar at Babylon—I saw the handwriting on the wall. And so I began....

Cheirourgos is the Greek word for 'surgery'. It stems from *cheir* 'the hand' + *ergon* 'work'—therefore, handwork or work performed by one's hands. (Things that surgeons do best.) Thus, the Medical and Chirurgical—or Surgical—Faculty.

Cheir may be found in several words, such as **chiropractor**—one who practices (a type of treatment) by using his or her hands. The chiropractor performs a **manipulation** (*manus:* Latin for 'hand'). You may also remember an obsolete specialty—**chiropodists:** those who treated diseases of the hands and feet (Greek *pous, pod*). Today, the specialty limits itself solely to the feet, and its practitioners are called **podiatrists.** The mammalian order *chiroptera,* which includes our friendly bats, owes its taxonomy to the same source—*cheir* 'hand' + *pteron* 'wing'—an animal with a winged hand. (A **helicopter,** by the way, is a *helix* 'spiral' + *pteron* 'wing'—a whirling or spiralling wing, referring to the propellers).

Ergon, the Greek word for 'work', is found in **energy**—Greek *en* 'at' plus *ergon* 'work'—to be "at work." And you may remember that the unit of work accomplished by one dyne acting through a distance of one centimeter is called an **erg.**

As noted above, the Latin word for 'hand' is *manus.* When we **manufacture** something, we make it (Latin *facere*) by hand, and the instruction **manual** describes how your hands must execute the task. That is precisely the reason we refer to them as **handbooks.** Incidentally, old **manuscripts** were actually written (Latin *scribere*) by hand—a subtle form of **manual** labor.

The French word *manouvrer* means 'to cultivate' the land (by working with the hands). Over years of lexical evolution, it has resulted in our word **manure**—literally the stuff our hands work with to fertilize the soil. (And occasionally used to describe this column.)

The **manubrium,** that distended upper sternal shield, looked like part of a saber to some creative prosector. Therefore, it was named *manus* 'hand' + *habere* 'to hold'—since it resembled the handle of a sword. The caudal portion of the sternum, of course, is called the **xiphoid,** which in Greek means

'like a straight sword'. In Latin it is called the *ensiform* process (*ensis* 'sword' + *forma* 'shape'—sword-shaped). The body of the sternum is seldom remembered. It is known as the **gladiolus** from Latin *gladius* 'sword'. All **gladiators** will grasp these penetrating observations.

The **gladiola,** a tropical member of the iris family, has funnel-shaped flowers arrayed on one side of the stem and a few sword-shaped leaves from which it obviously derives its name.

Pediatricians owe their title to the Greek words *paidos* 'of a child' + *iatros* 'physician'—children's physician. (**Iatrogenic** refers to disorders—*genic* 'caused by'—physicians.)

Orthopedics refers to Greek *ortho* 'straight' plus *paidos* 'child'—to "straighten a child," obviously a reference to bony and cartilaginous deformities in youngsters. It is **not** related, as some have thought, to the Latin word *pes* 'foot'—the genitive of which is *pedis* 'of the feet'. (As in **pedestrian** "one who walks," or **pedal**, "operated by feet.")

A **pederast** (from Greek *paidos*) indulges his grotesque carnal obsessions with (male) children. A **pedagogue** (from *paidos* + *agein* 'to lead')—that is, to lead or teach a child—is an educator. It is ironic, however, that some teachers become too **ped**antic. An **encyclopedia** derives from Greek *enkyklios* + *paideia* 'instruction of children in the circle of arts and sciences'.

Words derived from the Greek *pous* or the Latin *pes,* both of which refer to feet, are myriad and occasionally camouflaged. From the Greek we find such items as **tripod** (*tri* 'three-footed'), **octopus** (*octo* 'eight-footed'), **platypus** (*platy* 'flat-footed'), **polyp** (*poly* + *pous* 'many-footed'), and **podagra** (*pous* + *agra* 'a seizure'—that is, a foot seizure, or gout.)

From Latin we derive **impediment**, something that ensnares or entangles the feet; **expedite**, something that frees one who is caught by the feet; and **pedunculated**, the narrow stalk of a tumor that appears to be attached "by a foot" to its host. The **piedmont** region lies at the foot of the mountains (Latin *mons* 'mountain'), and **pedigree**, a genealogical chart whose lines connecting generations of relatives resemble the *pied de grue* (French) 'the foot of a crane.'

In ancient Rome, a midwife was known as an *obstetrix.* Virtually unchanged, the term currently delineates our obstetrical colleagues. It derives from the Latin *ob* 'in front of' + *stare* 'to stand'—that is, someone who stands or occasionally sits, in front of the parturient female. Which, of course, is where one expects to find such specialists.

During the 17th century, as Galileo invented his telescope in Italy and William Harvey described the circulation of blood in England, French physicians began to usurp the function of midwives. These were among the first physicians to attend and deliver pregnant women and were called **accoucheurs**. (French: to minister to someone 'on the couch'—a reference to the labor bed.) The term is obsolescent but may occasionally be heard with reference to the **accoucheur's hand**—carpopedal spasm, usually induced by hypocalcemic tetany,which results in a distorted hand shaped like that of a delivering obstetrician's.

This may be observed in acute pancreatitis, hypoparathyroidism, and metabolic or respiratory alkalosis. It forms the basis for Trousseau's Sign—elevation of a blood pressure cuff above systolic pressure for five minutes—resulting in carpopedal spasm in patients with hypocalcemia. Armand Trousseau described the sign in 1862, calling it *Main D'accoucheur.*

The term **midwife** is from the German *mit* 'with' + *weib* 'wife', which became **midwif** in Old English, and refers to the individual who remains "with the wife" during delivery. Midwives themselves may be female or male.

Incidentally, a maneuver performed by obstetricians in the past was known as **podalic version.** It consisted of turning the fetus into position for delivery by manipulating both feet into the cervical canal. (**Podalic** from the Greek *pous* 'foot'.)

"and that," I finished triumphantly, "is what chirurgical means."

He was fast asleep.

The meeting was over. ■

A Look Back

The activities of the Medical and Chirurgical Faculty

Reprinted from the *Maryland State Medical Journal* 1952; 1(1):3–6.

Walter D. Wise, M.D.

Dr. Wise was Med Chi president in 1951.

For a long time, it has been evident to officers of the Medical and Chirurgical Faculty that many members have inadequate knowledge of the activities of this society and its indirect value to them. Some members feel that because they do not use the library, for reasons of distance, lack of time, or some other cause, they get no benefits beyond the pleasure and advantages of the medical meetings, which in most state societies are limited in number (this function being for the most part the responsibility of the city and county components). Because it seems necessary that the manifold activities of our state society and its components become better known, it was decided to find a more fitting medium for the transmission of their transactions. To this end, as is pointed out elsewhere in this issue by Dr. Edwards, chairperson of the Council, it was decided to publish a journal. It is almost certain that at no time in our history has it been more important to have a well-organized and supported state medical organization.

The number of doctors in our society has increased from 1,232 in 1925 to 2,401 in December 1951*, and the activities of our organization have multiplied to a very great degree.

In 1925 there were the same three committees as we have today, which are elected by the House of Delegates: The Committee on Scientific Work and Arrangements, the Library Committee, and the Finney Fund Committee. The Professional Conduct Committee, which was inaugurated in April 1950, is the only other committee included in the Constitution and Bylaws.

The work that may be called routine, such as that of the library, which has about doubled in the past 25 years, the regular medical meetings, the Council meetings and those of the standing committees, has gone on as before except for a considerable increase in the volume of work and the results. At present, there are 32 appointed committees, of which six were in existence in 1925, at which time there were only eight committees all told.

In addition to the duties of the regular standing committees, some of the newer matters that have called for varying numbers of meetings and hours of work and which have resulted, in some cases, in the appointment of additional standing committees, are:

a. Our part in developing the Blue Cross, on whose board (Maryland Hospital Service) we have 24 corporate members.

b. Our part in the development of the Blue Shield, on whose board (Maryland Medical Service) we have eight Class "A" members.

c. The development of the Medical Care Plan. (As a result of a recommendation of the House of Delegates of the Medical and Chirurgical Faculty.)

d. A detailed survey of the hospitals of Maryland under direction of the Medical Committee of the State Planning Commission.

e. Aid in the implementation of the Hill-Burton Act, of which funds there has been spent in Maryland in the past four years $4,177,000 of federal money. By June 1952, the amount will be $5,197,836.06. There has been participation in 25

*Editor's note: As of January 1993, there are 7,020 members.

projects, with a total expenditure at the end of the current year of over $17,000,000. This has been done through a statewide committee of laypersons and representatives of the state Department of Health and the Medical and Chirurgical Faculty.

f. The Faculty has representatives on the Red Cross Regional Blood Center Program Committee and Medical Committee.

The representatives of the Faculty on the above mentioned boards, committees, etc. conduct their activities independent of the Faculty office. The chairperson of the 32 existing committees carry on the functions of their committees usually through the office of the Faculty.

The committees which functioned in 1925 and are still in existence are as shown in **[Table 1].** Since 1925, [many] committees, besides others which have been discharged, have been appointed and in most instances the name indicates the work of the committee **[Table 2.]**

The amount of time and thought put into the efforts of these committees and the amount of material reported out would surprise anyone not familiar with the proceedings. Perhaps the unknowing visualize the committees as having a meeting or two and finishing their work. This is true in a few instances. Those who were responsible for developing the Blue Shield, the Medical Care Plan for the Indigent, those who work on the "dog fight" or made the hospital survey for the obtaining of the Hill-Burton Act funds, would have a different account to relate.

The amount of material that comes to 1211 Cathedral Street from the Chicago and Washington offices of the American Medical Association, and almost countless independent groups of doctors and lay organizations, largely concerning matters detrimental to the profession or public welfare, would likewise be surprising. This has to be read and acted upon. As stated, the Maryland Legislature now meets yearly instead of every two years as formerly and this means that the Legislative Committee and director of the Faculty have to give almost twice as much time as formerly to the guarding of the public interest.

Probably few of our members know that under the law, the governor of Maryland requests the officials of the Medical and Chirurgical Faculty to submit lists of names, from which he makes appointments on the following boards:

1. ***Medical Board for Occupational Disease for the State Industrial Accident Commission.***
2. ***Council on Medical Care of State Department of Health.***
3. ***Advisory Council on Hospital Construction to the State Board of Health.***
4. ***Advisory Board to the State Department of Health for Licensing of Hospitals.***
5. ***State School Health Council.***
6. ***State Board of Physical Therapy Examiners.***

The first annual meeting of the Women's Auxiliary of the Medical and Chirurgical Faculty was held in April 1950, and this organization is taking an active part in community affairs, educational projects, etc., and the Faculty office is doing the secretarial and clerical work of the auxiliary.

One outstanding function of our state society that should be cherished

Table 1. Committees in existence from 1925–1952

1. ***Maternal and Child Welfare Committee,*** which has been very active and helpful in reducing the mortality rate in newborn babies and young children.
2. ***Memoir Committee.***
3. ***Eugene Fauntleroy Cordell Fund Committee.*** (Formerly Fund for Widows and Orphans, and given present name to honor Dr. Cordell.)
4. ***Committee on Public Instruction.*** Radio and television programs are given under the auspices of the Medical and Chirurgical Faculty and Baltimore City Health Department, and other public educational programs through state and city health departments.
5. ***Committee on Defense of Medical Research.*** A most recent activity was the fine work in the antivivisection fight in Baltimore City, and resulted in the formation of the Maryland Society for Medical Research—a strong organization deserving of warm support.
6. ***Legislative Committee.*** There has always been a Legislative Committee and the work carried on by these members, particularly during the time when the General Assembly meets in Annapolis, which is now every year, is a very heavy load. Members of this committee, particularly the chairperson, are compelled to spend much time in Annapolis to attend meetings of the legislature so as to bring to the attention of the members of the House and Senate the effect on the public of bills pertaining to medicine and related matters. The committee makes every effort to protect the health and welfare of the citizens of Maryland.

Table 2. Committees existing in 1952

1. ***Committee on Constitution and Bylaws.*** The Faculty now has a standing Committee on Constitution and Bylaws and in these changing times, this committee spends a great deal of effort in keeping the Constitution current.
2. ***Physiotherapy Committee.***
3. ***Army Medical Library Committee.***
4. ***Cancer Committee.***
5. ***Tuberculosis Committee.***
6. ***Mental Hygiene Committee.***
7. ***Committee on Rural Medicine.*** This committee has held in recent years two rural health conferences in the Faculty building, which were attended by physicians and lay people from throughout the state.
8. ***Committee on Industrial Health.***
9. ***Blood Bank Advisory Committee.***
10. ***Medical Care Campaign Committee.*** The Council at its meeting on February 10, 1949 adopted the recommendation of a Special Committee, which has representatives from every county in the state, as well as a Speakers Bureau. This committee disseminates educational information to the public, provides speakers, and carries on an active campaign against federalized medicine.
11. ***Sesquicentennial Committee*** (new building).

    Subcommittees:

    Finance

    Building plans
12. ***Committee to Advise the State Industrial Accident Commission.***
13. ***Committee on Medical Service and Public Relations.***
14. ***Postgraduate Educational Committee.***
15. ***Diabetic Detection Committee.***
16. ***Committee to Study Certain Phases of Medical Economics.***
17. ***Committee to Consider the Relationship Between Hospitals and Specialties and the Manner of Payment for Professional Services.***
18. ***Presidential Advisory Committee.***
19. ***Civilian Defense Committee*** with its several subcommittees. Some of the recently appointed committees are functioning as follows:

- (20.) ***A Scientific Speakers Bureau*** has made available to component medical societies a list of physicians, who will address their societies on current medical subjects.
- (21.) ***Advisory Committee to the Women's Auxiliary,*** which consists of five Faculty members who are available at all times to assist and advise the officers of the auxiliary in their projects.
- (22.) ***The Advisory Committee to the State Health Department,*** which meets with members of the state health department to iron out any difficulties which may arise between the profession and state department of health. This is an active committee and an able detailed report was given by Dr. A. A. Pearre at the Ocean City semiannual meeting, September 14, 1951.
- (23.) ***Professional Conduct Committee.*** Never a week goes by that this committee does not receive mail from either lay people or doctors embodying complaints. This committee gives a great deal of study to the problem and settles the differences in many cases.
- (24.) ***The Committee for the Study of Pelvic Cancer*** was approved by the House of Delegates and Council in April 1951 and has set up an office in the Faculty building under the auspices of the American Cancer Society.
- (25.) In recent months, a ***Joint Committee of the Faculty and Bar Association*** has been formed, and it is hoped through their efforts to have a closer liaison between the medical and legal professions. To this end, they are holding symposiums on timely subjects to which the medical and legal professions, as well as the public, are invited. One important meeting on the narcotic problem has been held. In December, there will be a meeting on court procedures.

and forever protected is the election of the State Board of Medical Examiners. As far as we know, we are the only state having this privilege.

These are some of the many activities to which the members of the Medical and Chirurgical Faculty give their time, advice, and knowledge to help the citizens of the state of Maryland. Many of you are on some of these committees, some have wide knowledge of the activities of the so-

ciety as a whole—many do not. To acquaint the entire membership with our statewide activities is one of the chief reasons for the desire to publish a larger journal.

For the most part, the subjects just mentioned are at the state level. About one-half of the state society membership is in Baltimore City. The Baltimore City Medical Society uses the Faculty headquarters and office staff. Their society is broken up into numerous sections, with their many meetings which have to be arranged. They have their own committees as follows:

1. ***Committee on Geriatrics.***
2. ***Committee on Emergency Medical Calls.***
3. ***Health and Physical Education.***
4. ***Hospital Survey Committee.***
5. ***Legislative Committee.***
6. ***Maternal Mortality Committee.***
7. ***Maryland Committee Against Un-American Activities.***
8. ***Program Committee.***
9. ***Committee on Public Medical Education.***
10. ***Magistrate's Committee.***
11. ***Membership Committee.***

The city society also has its own women's auxiliary. The activities of the Baltimore City Medical Society plus those of the county societies, of course, are to be added to the total accomplishments of the state society.

The *Bulletin of the Medical and Chirurgical Faculty,* a leaflet, was inaugurated in December 1927 to give the members a concise account of the activities of the state association. Subsequently, in April 1949, the secretary, Dr. Yeager, felt that it would be advisable to supplement the *Bulletin* with a newsletter, which would be informal and carry information to the members relative to the activities of the Medical and Chirurgical Faculty, American Medical Association, etc. The journal will bring the information contained in the *Bulletin* and newsletter, plus scientific articles and editorials. We hope it will be extremely valuable.

One sometimes hears the inquiry—what do I get out of the state society for my dues? We hope the reading of this journal will give a clear answer. One answer that has been true over the years is—you have working for your interest and in the interest of the public, several hundred committee members who give a surprising amount of time and energy. Their services could not be purchased with money.

It is hoped that in forthcoming issues of the journal, the members will become familiar with the activities and accomplishments of the Medical and Chirurgical Faculty. ■

Library Volunteer Opportunities

The library is seeking interested volunteers to help process Med Chi's historical collections. Projects include cataloging medical instruments, arranging and describing medical manuscripts, and rehousing prints and photographs. Our goal is to make this material accessible for members and researchers in the history of medicine. If you would like to be part of this exciting project, please contact **Margaret Burri, Historian/Administrator, at 410-539-0872 or 1-800-492-1056.**

From the Med Chi Collections

Literature searches in response to patient inquiries

When faced with a direct question by his patient, the court requires that the physician must research the question and base his judgment for treatment on this research.... It would be just good basic medicine to conduct a literature search.

Sam Pemberton, J.D., attorney
Tacoma, Washington

The above quotation is taken from an article entitled "Informed consent in an information society" that appeared in the March/April 1992 issue of the National Library of Medicine's publication *Gratefully Yours.* Sam Pemberton had represented an air force couple in a medical malpractice action against the United States government. The wife had been diagnosed as having epilepsy and was taking the anticonvulsant drug, Dilantin (phenytoin), prescribed by military doctors. When the couple decided to have more children, they made appointments with three different military physicians specifically to ask about the risks of taking Dilantin. Relying on the information the physicians provided (that the anticonvulsant could cause only cleft palate and hirsuitism, which were both correctable), the couple had two girls over the next two years. Both girls were subsequently diagnosed as having fetal hydantoin syndrome, and suffer from mild to moderate defects.

Damages were sought for the failure of the three physicians to respond to the plaintiffs' questions concerning the risks of anticonvulsant medication on unborn children. The court said: "With the demands of their profession, no one can expect doctors to have all material information stored in their minds.... A literature search will put a physician on notice of these risks." Judgment was subsequently entered in favor of the couple.

Again quoting Sam Pemberton: "the standard of care requires that, when faced with a *direct question* by a patient, the physician must research the question and base his or her judgment for treatment on this research."

How Med Chi can help

The Med Chi library will be happy to provide literature searches for you using our MEDLINE search capabilities, which allow us rapid access to the 7+ million citations in MEDLINE. Simply call us with your search requirements (410-539-0872 or 1-800-492-1056), or fax them to us at 410-727-5967. We normally provide search results the same day via fax; if yours is an emergency situation, we will conduct the search and provide you our results immediately.

If the information contained in the abstracts is insufficient for your needs, we can then provide you copies of the articles from the Med Chi collection or request the information from another library if we do not have the article(s) needed.

And for a limited time only...

If you are a member who has never used our literature search service, we shall provide you your first search free. (Our normal charges for members are designed to recover costs only, and are billed at only $2 for each year searched. If the results exceed six pages and you wish us to fax the citations to you, there is an additional fee of $.50 per page for the seventh and following pages.)

Conclusion

The Med Chi library can help in obtaining the information your patients need quickly and economically. We can also help you in gaining access to such information for yourself. Please feel free to contact us.

STEPHEN JONES, MA, MS
Manager, Information Services
Med Chi library ■

Beginning with this issue, the "Library Page" has been renamed "From the Med Chi Collections" to more adequately reflect the scope of the library's activities, including automated information services, history of medicine research materials, and current medical literature.

Consultation, a weekly radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on WBAL to discuss the lastest developments in medicine and to answer questions about health issues. Med Chi currently airs the following program of Consultation weekly:

Sunday Morning Consultation
A half-hour program
Interview format: one-on-one talk with John Stupak
Pretaped Wednesday evenings from 7:30 p.m. - 8:00 p.m.
Play back is on WBAL-AM radio Sunday mornings at 9:30 a.m.

Book Reviews

The Travelling Free-Lance Physician! How to set up and operate your own locum tenens practice. Gary L. Monroe. Houston: Magellan Publishing Company. 1990. 157 pages. $75.00.

Because physicians must occasionally absent themselves from their practices, the author believes that a growing need for qualified free-lance doctors exists. These temporary physicians must be able to travel on demand and provide quality care. Multiple locum tenens positions may offer a recommended variant to a steady, confined practice, and, for physicians who agree, the manual may be useful.

Entrance into the field may first be gained by accepting offers from an agency. As individuals become more experienced in this type of practice, they may advertise for positions and eliminate the intermediary, thus making a greater amount of money. The author provides all of the details for creating a free-lance, locum tenens practice.

He avers that such a physician may earn more than a substantial income, gain greater clinical experience, and have time for travel, study, and further education. Monroe lists certain caveats: the doctor must be competent, have good credentials including board certification, be flexible, be capable of adapting to new and varied working environments, be self-motivated, and have a good business sense.

He adds lists of locum tenens and physician placement agencies, the names and addresses of state licensing agencies, malpractice carriers by state, current rates of pay for replacement physicians as charged by agencies, and societies that might have mailing lists for members to use in locum tenens marketing.

Details of recordkeeping and accounting while at home and on the road are suggested. The system is simple and utile as experienced by the author. Options for eating, lodging, and transportation are presented. A sample of a contract agreement between the physician and the hiring party is presented in detail.

The reasons for the pursuit of a locum tenens practice are presented in a rosy manner, but the disadvantages are glossed over. The difficulties of being away from home for irregular, perhaps protracted, periods are not mentioned. Family life, particularly if children are involved, could become most difficult. Daily contact with spouse and children could be lost and unhappiness result. Unmarried physicians may find this wandering existence wonderful, but the married individual may think differently.

Monroe is an anesthesiologist and so may more easily shift into a locum tenens type of practice. Even at a home base, work is provided for him by his surgical colleagues. At other hospitals away from home, he probably finds professional acceptance more easily than if he were a surgeon taking over an established practice.

Set in large type, the book may be read easily. The information is frequently redundant, however, and the format could be improved by elimination of repetitive material. The price seems exorbitant considering the nature of the material presented.

■ ■ ■

In My Father's House. E. Hunter Wilson, Jr., M.D. Baltimore: The Johns Hopkins University Press. 1992. 274 pages. $18.95.

Stress, guilt, sorrow, resentment, and, finally, relief characterize this first novel, a story of the pursuit of a residency at the

Johns Hopkins Hospital in the 1930s. Perhaps these feelings linger to some extent today, although some changes in the mechanics of the system may have occurred to relieve the fear of not being a real achiever. The grueling and tiresome demands of the hospital service on the resident's time frequently led to unhappiness and a difficult family life. The most elite medical staff in the country could graduate only the best residents, who were then to take leading places at other institutions.

Hunter honestly appraises the rigorous nature of this residency system and, having been a resident at Hopkins, may do so properly. Two main characters are presented in the novel. One, who has achieved the professorship of neurosurgery, tacitly approves the decision of a young intern, delegated to his care, who decides to put the medical portion of this life in hibernation for a period of time so that he may regroup, rethink, and perhaps avoid the tempestuous life experienced by the professor.

This well-written book has three parts—a prologue, story, and epilogue. The main characters are introduced in the prologue; the professor and an intern on the medical service who cares for him during his illness. Through a series of flashbacks to 1935, the story is interwoven with events occurring 50 years later in which the professor reviews his interim life of great professional reward and deep personal tragedy.

He finally reaches the goal of his days as an intern but at his retirement ceremony, he collapses. In the course of his hospitalization, the true nature of his illness—cocaine addiction—is recognized by the intern. The wife of the chairperson is an alcoholic and his daughter has become relatively estranged from him because of the "marriage" of the professor to his

E. Hunter Wilson, Jr., M.D., the author of *In My Father's House*, is a graduate of Hopkins and an internist in private practice in Baltimore.

career. In the epilogue, the reader is left to judge whether or not the course is worth running when all the obstacles and results are considered. After spending time with the professor, the intern has second thoughts about continuing his own medical career and resigns his internship to find time for self-exploration.

All becomes well at the close of the novel as the professor and his family gain a deeper understanding of life, its problems, and their interrelationships. He learns that the intern might be his grandson and that he may have some role in helping his newly found relative at a later date.

Knowledge, fame, and grief were the temporal rewards of the professor, but he had little familial happiness. Fortunately, the convalescence from his illness offered him an opportunity to reconstruct his life and seek a better living with his family. He had never clearly seen his goal in life, having been blinded by his driving desire for medical success.

The residency system, as it is portrayed, has much to condemn it. A casual review of the placement of the individuals who were graduates of the system under one of the last professors of surgery at the institution, however, reveals the high quality of the education provided. Many of these men became chairpersons or professors at other medical schools and made distinct contributions to the enhancement of the medical education of others. These results partially justify the harshness of the system that produced them.

The period of residency, a time of refinement, is the occasion of true separation from family and the start of a career. Newly graduated individuals at center stage and a crossroad of life are desperately trying to reach the top of their profession. The educational road is rigorous, but the reward at the end of the rainbow is great. Finished residents may be satisfied that they have competed successfully with their peers and withstood the multiple challenges of the system. Honest curiosity leads to hard work and enables them to realize their potential ability. Much good can be said for the system.

Conceiving the story, Hunter invents persons and situations to accomplish his task. Journalistic license has carried him too far in certain portions of his account, however, and these episodes lend little substance to the total picture. The trip to Saudi Arabia and the unfortunate craniectomy on his own son, based on a missed diagnosis by the professor, add nothing to the fundamental theme. The added self-inflicted punishment resulting from the operation was not necessary to complete the story.

The reading is light and does not require reader effort. Individuals who are acquainted with Hopkins will enjoy fitting real people with the characters portrayed in the book.

Medicine's New Vision. Howard Sochurek. Easton: Mack Publishing Company. 1988. 179 pages. $39.95.

"To see what no man has seen before," a paraphrase from *Star Trek,* describes the activity that Howard Sochurek relates in this book. Radiology has made giant leaps forward in the last 20 years, with each exciting accomplishment being followed rapidly by another. The need for x-rays to visualize the anatomic area under study has been removed by new techniques as scientists have created safe, accessible, and nonpenetrating methods to explore the body. Literally, the history of this era could be titled, "Tomorrow is Yesterday."

Continuing, parallel investigations have unearthed multiple methods of anatomic visualization and, in some instances, of functional evaluation. The radiologic literature has become replete with a fascinating number of acronyms: magnetic resonance imaging (MRI), computerized axial tomography (CAT scan), ultrasound (US), positron emission tomography (PET), and single photon emission computerized tomography (SPECT). In addition to these subjects, the author discusses the various types of interventional radiology such as angiography, including computer manipulation (digital subtraction), angioplasty by balloon and laser, cavity drainage, vessel occlusion, and extracorporeal shock wave lithotripsy, used by the radiologist/urologist team to fragment renal calculi. A brief reference is also made to the treatment of cholelithiasis. The book concludes with a section on radiation therapy and one on mammography.

Despite the phenomenal growth of these new techniques, 80% of the radiologist's work is still plain film radiography. At the time of publication, over 130 million conventional diagnostic radiographic procedures were performed annually in the United States, with the exposure of about one billion films.

Curiously, Sochurek first presented his material in the January 1987 issue of *National Geographic.* The reason for the appearance of his studies in that magazine is unknown, although he may have believed that the article would more likely reach a greater lay and professional audience. At the urging of the Radiological Society of North America, he subsequently expanded the covered material by adding newer work and produced a book. He strongly emphasizes the ever-changing role of radiology in the medical arena and underscores the important part of the radiologist in medical diagnosis and, in some instances, treatment. The public need-to-know aspect of his presentation takes precedence in this encyclopedic portrayal of the various forms of radiologic endeavor.

He introduces the layperson to many of these diagnostic procedures by describing his own reactions as he experienced some of them himself. He supplements these accounts with stories of patients whose lives were markedly improved or even saved as a direct result of surgical intervention based upon these fascinating investigations.

MRI has become a powerful and versatile diagnostic tool that has led to the proliferation of equipment and stimulated research in this area. The physics of MRI has not changed much in the last few years, but the understanding and significance of these phenomena have. Technology has advanced tremendously since MRI entered its first clinical trials. The method is exciting because it does not employ ionizing radiation. When conventional x-rays are used, the only tissue-specific parameter that may be determined is electron density, which varies but little in different soft tissues so that the use of contrast material is frequently necessary for delineation of abnormal changes. A multitude of tissue conditions may affect MR (magnetic resonance). In addition, signal acquisition boundaries may be manipulated in a number of ways to control image contrast.

The author credits Dr. Paul Lauterbur with the first MRI technique in 1972 when he was able to generate a two-dimensional image of proton density. Lauterbur gave his methodology the unusual name of "zeugmatography," derived from the Greek word *zeugma* meaning 'joining' and published his findings in the March 16, 1973 issue of *Nature.*

Strangely, the efforts of Dr. Raymond Damadian, one of the pioneers in the MRI field, are not mentioned by Sochurek and, indeed, Lauterbur does not reference Damadian in his paper. The work of Damadian was published in Science on March 16, 1971. The two men were acquainted, and each knew of the work of the other. As has occurred before in medical research, they reached similar conclusions in an independent fashion.

Like all good things, a caveat is associated with the use of MRI. Being new, its best uses have not yet been delineated, and many doctors will employ the device when it is not needed. Because it is free of risk, it will often come into use as a purely defensive measure. The cost of the simplest form of MRI is about $900, and so it should be ordered only when the doctor is unable to make a diagnosis otherwise. The machine should not routinely become a substitute for the cranial computer with which the physician is naturally endowed.

Although more anecdotal than analytical, the book is well written

and has an excellent format. Most of the large number of illustrations are in color. The book will serve as a good introduction to this field for the laity and for many doctors. If reading the book accomplishes little else, it will encourage the reader who becomes a patient to discuss the investigative modalities that may be available to him/her for diagnosis. Certainly the cost factor should enter the discussion and, if a less expensive procedure will give the necessary information, it should be selected.

JOSEPH M. MILLER, M.D.

Join us in a new kind of partnership ... uniting doctors, lawyers, teachers, parents, and youth against drug and alcohol abuse.

Become part of the Maryland Doctor/ Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the war against drugs. Become part of a unique initiative in Maryland to bring doctor/ lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

To volunteer or for more details, call Med Chi's Public Relations Department at 410-539-0872 1-800-492-1056.

Doctor/Lawyer/Teacher Partnership Against Drugs

EASTERN SHORE, MARYLAND:

New hospital opening late Spring of 1993 on Maryland's Eastern Shore, serving a dynamic community on the Atlantic Ocean. We have opportunity for BC/BP, residency trained physicians in Emergency Medicine. Excellent salary and benefit package. Qualified candidates send C.V. to James A. D'Orta, M.D., 199 Lionhead Court, Baltimore, MD 21237. Fax or Tel: (410) 686-2124.

Council Minutes

Medical and Chirurgical Faculty of Maryland
Council (400th meeting)
Friday, September 18, 1992
Princess Royale Hotel, Ocean City, Maryland

Chairperson of Council, Joseph S. Fastow, M.D., called the meeting to order at 1:45 p.m.

Approval of minutes

The Council approved the minutes of the July 16, 1992 meeting. The unapproved minutes from the Executive Committee's meeting of September 3, 1992 were distributed for information purposes only.

Welcome comments by Joseph T. Painter, M.D.

Dr. Fastow introduced Joseph T. Painter, M.D., president-elect of the American Medical Association (AMA).

Dr. Painter stated that it was a pleasure to be a part of Med Chi's semiannual meeting and brought greetings and best wishes from the AMA for a successful meeting. Dr. Painter reported that the AMA was moving forward and representing physicians more aggressively nationwide. Dr. Painter further stated that Maryland is a key player in the Federation and is respected for its activities. The AMA also expressed its appreciation to the Faculty for its support of the "Health Access America" program and the Faculty's peer review model. Dr. Painter noted that the Faculty's peer review program should be viewed in other states so that it can be replicated to bring into focus the need to have a strong, sound disciplinary system.

In closing, Dr. Painter stated that the AMA was extending a special note of thanks to the Faculty for being one of four states joining the AMA in the project, "Medical Management in Home Care." This project is a demonstration program designed to educate physicians about the benefits of caring for the elderly in their homes. To date, Maryland is one of four states (Maryland, Arizona, Texas, Illinois) involved in this program. This CME (continuing medical education) program has been presented at Med Chi's 1992 annual meeting and semiannual meeting and will be presented at the President's Regional Conference on October 22, 1992 in Hagerstown and at the 1993 annual meeting.

Dr. Painter further stated that he was looking forward to participating in Med Chi's meeting and will return to the AMA with many good ideas.

Emeritus membership

The Council approved emeritus membership for the following physicians as requested by their component society:

Anne Arundel County

John L. Pitts, M.D.

Baltimore County

Morton J. Ellin, M.D.
Mehdi L. Yeganeh, M.D.

Howard County

Elwood J. La Brosse, M.D.

Montgomery County

Horace W. Bernton, M.D.
James L. Laubach, M.D.

Waiver of dues

The Council approved the waiver of dues for the following physician as requested by the component society:

Baltimore County

Franklin D. Israel, M.D.

Legislative committee

Dr. Fastow called upon Jose Martinez, M.D., chairperson of the Legislative Committee.

Dr. Martinez reported on the committee's meeting of September 2, 1992. In accordance with Council's direction on July 16, 1992, the Legislative Committee met and developed a recommendation on the position of self-referral. The committee's recommendation, which was to be reported to the House of Delegates, was that the Faculty should oppose any legislative activity that prohibited or restricted such activity as long as self-referral was in compliance with the state disclosure laws.

Dr. Fastow stated that no further action was required at this time and that the House of Delegates would debate this issue.

Managed care and third-party liaison

In the absence of Donald Dembo, M.D., chairperson of the Committee on Managed Care and Third-Party Liaison, Dr. Fastow stated that the committee recommended that the Faculty support the Maryland Alliance for Health Care's request for $2,500 to cover Med Chi's share of the expenses associated with continued participation with the alliance, as well as to provide for future needs. This recommendation was approved.

BPQA actions reported in the *MMJ*

Dr. Fastow reported that in accordance with Council action of July 16, 1992, correspondence had been sent to Israel H. Weiner, M.D., chairperson of the Board of Physician Quality Assurance (BPQA), requesting the BPQA's position on reporting cases in the *MMJ*.

Michael Compton, executive director of the BPQA, responded to Med Chi, stating that the BPQA will forward the entire published order to the Faculty and the Faculty can summarize the order as it believes appropriate for publication in the *MMJ*.

On September 11, 1971, Council adopted the position that publication in full of the findings of fact...be pub-

lished in the *Maryland State Medical Journal.* In order to change this position, Council moved and adopted that the Editorial Board of the *MMJ* be given the authority to edit the BPQA orders for publication in the *MMJ.*

CLIA 88

Dr. Fastow reported on the status of the CLIA 88 (Clinical Laboratory Improvement Amendments of 1988) issue. The Faculty forwarded correspondence to Nelson J. Sabatini, secretary of the Department of Health and Mental Hygiene (DHMH), asking that he support the recommendations of the Laboratory Advisory Committee (LAC) to apply for "exempt" status under CLIA 88.

Mr. Sabatini indicated that the Laboratories Administration Office was considering a bill that would amend the state's laboratory law to bring it in line with the federal law. The bill would remove those sections of Maryland law that put it in conflict with CLIA 88 and provide DHMH with authority to promulgate standards "substantially equivalent" to those under CLIA 88. If successful, the state could apply for exempt status from the Health Care Financing Administration (HCFA).

Dr. Fastow further stated that DHMH was expected to make a decision regarding legislative proposals within the next few months.

Maryland AMA Delegation

Dr. Fastow called upon George S. Malouf, M.D., chairperson of the Maryland AMA Delegation.

Dr. Malouf stated that due to the resignation of W. David Sullivan (student alternate delegate), whose term would expire on December 31, 1992, the Student Component Society has nominated Mr. Robert Ferris to complete the unexpired term of Sullivan.

Council moved and approved the appointment of Mr. Robert Ferris.

HCFA'S evaluation and management analysis

Dr. Fastow stated that Barry Gold, M.D., medical director, Medicare, Maryland Blue Cross and Blue Shield (BCBSM), was unable to attend the meeting. The material provided to councilors included minutes from the July 22, 1992 meeting at Maryland Medicare, BCBSM. During this meeting, Dr. Gold provided a booklet entitled *CPT Evaluation and Management Code Data Analysis.* Dr. Gold also provided a letter responding to physicians' concerns regarding a letter they received from Maryland Medicare about the Comparative Performance Report for the new evaluation and management codes. Dr. Gold explained that this letter was intended for informational use only.

Committee on Scientific Activity

Dr. Fastow called upon J. Richard Lilly, M.D., chairperson of the Committee on Scientific Activity.

Dr. Lilly reported on the committee's meeting of September 9, 1992. He stated that the theme of the 1993 annual meeting will be "Prevention '93—Maryland." It will be held at the University of Maryland, College Park, on April 30 and May 1, 1993. This theme is consistent with recent needs assessment surveys of members, as well as plans for prevention efforts in the unlikely event of an exposure incident from mustard gas disposal within Maryland.

Dr. Lilly also stated that during the 1993 annual meeting, the Council and House of Delegates will meet in the afternoon beginning at noon with a luncheon meeting of the Council.

Delmarva foundation

Dr. Fastow called upon Christian E. Jensen, M.D., M.P.H., president and corporate medical director of the Delmarva Foundation for Medical Care, Inc.

Dr. Jensen briefed the Council on HCFA's new approach to improving care for Medicare beneficiaries through a program called "The Health Care Quality Improvement Initiative" (HCQII). This program will be embodied in HCFA's fourth scope of work. Dr. Jensen also provided Council members with copies of several articles that appeared in the August 19, 1992, issue of *JAMA,* which describe this program.

Meeting with Marilyn Goldwater

Dr. Fastow stated that a meeting was held with Marilyn Goldwater, executive assistant to the governor, who discussed a proposal for health initiatives that would focus on preventive health care. Dr. Fastow further stated that Ms. Goldwater indicated that funds were needed to support the governor's mobile health van, which is a part of this proposal. This matter was presented for information purposes only, since it was still in the formative stages.

BCBSM Medicare payment performance

Dr. Fastow stated that Council was provided material from Congressperson Ben Cardin pertaining to BCBSM's plan to improve its performance (i.e., timely processing of claims, reduction of electronic Medicare claims (EMC) rejections, and prompt and accurate transfer of Medicare crossover claims to Medicaid). This material was provided for information purposes only.

Submission of acupuncturist resolution to the AMA

Dr. Fastow called upon Jose Martinez, M.D., who presented recommendations and a resolution pertaining to acupuncture on behalf of Margaret Mullins, M.D., who was unable to attend.

Council moved and approved the following recommendations that

1. Med Chi adopt a position supporting any state legislation that would remove all limitations on the physician in the practice of acupuncture.
2. Med Chi would not oppose legislation that would create a nonphysician board of acupuncture within the BPQA to address the needs of nonphysicians.

Council also moved and approved the resolution on acupuncture, which will

be forwarded to the Maryland AMA Delegation for editing, then submitted to the AMA for consideration at the I-92 (Interim 1992) meeting in December.

Resolved, That the AMA adopt a policy that physician practice of acupuncture should only be regulated directly by state medical boards, and not by predominately nonphysician advisory committees.

Lobbying/legal services

Dr. Fastow stated that discussions have taken place with the law firm of Rifkin, Evans, Silver, and Rozner as a follow-up to the firm's suggestion that the Faculty provide its own legal services. As a result of those discussions, a mutual agreement had been reached whereby Med Chi would separate its legal service from its lobbying services. It was the consensus of the Council to accept the chairperson's announcement, as indicated by there being no objection to the report of the chairperson, and also by Council's applause of the chairperson's announcement. Dr. Fastow further stated that Med Chi would maintain its agreement with Rifkin, Evans, Silver, and Rozner for lobbying services. Negotiations were currently underway, and an update would be provided to the Executive Committee at its next meeting.

Adjournment

There being no further business, the meeting adjourned at 2:35 p.m.

CAROL W. GARVEY, M.D.
Secretary ■

House of Delegates Minutes

Medical and Chirurgical Faculty of Maryland
House of Delegates (338th meeting)
Saturday, September 19, 1992

The 338th meeting of the House of Delegates of the Medical and Chirurgical Faculty was held on Saturday, September 19, 1992 at the Princess Royale Hotel in Ocean City, MD.

Present were the following delegates:

Allegany

Rubustiano J. Barrera, M.D.[1]
Frederick Miltenberger, M.D.
Leslie R. Miles, Jr., M.D.[6]

Baltimore City

Raymond M. Atkins, M.D.[6]
Paul Burgan, M.D.
Beverly A. Collins, M.D.
Augusto R. DeLeon, M.D.
Donald H. Dembo, M.D.[6]
Willarda V. Edwards, M.D.
Albert Folgueras, M.D.
Frank A. Giargiana, Jr., M.D.
Susan R. Guarnieri, M.D.[6]
Rafael C. Haciski, M.D.
Claude D. Hill, M.D.
Thomas E. Hunt, M.D.
John B. MacGibbon, M.D.
Donald W. Mintzer, M.D.
Hiroshi Nakazawa, M.D.[6]
Samuel I. O'Mansky, M.D.
Stephen K. Padussis, M.D.
William B. Russell, M.D.[1]
Bernard R. Shochet, M.D.
Roland T. Smoot, M.D.[3,6]
George Taler, M.D.[1]
Karl H. Weaver, M.D.
Jose M. Yosuico, M.D.[2]
Joseph W. Zebley III, M.D.

Baltimore County

Thomas E. Allen, M.D.[6]
Marianne Benkert, M.D.[6]
Albert L. Blumberg, M.D.[2,6]
Harold B. Bob, M.D.[6]
Herman Brecher, M.D.
Louis C. Breschi, M.D.[6]
Esther Edery, M.D.[6]
Scott D. Hagaman, M.D.[1]
Richard M. Hirata, M.D.
Deusdedit Jolbitado, M.D.
Jose Martinez, M.D.[1]
Ronald Jay Orrell, M.D.

Calvert County

Joseph Fastow, M.D.[2,6]
Alexander Panos, M.D.

Caroline County

Christian Jensen, M.D.[6]

Cecil County

Andrew P. Fridberg, M.D.

Charles County

Khadar Baig, M.D.
Guillermo Sanchez, M.D.[6]

Dorchester County

Mohammad Walid Kamsheh, M.D.[1,6]
Paul A. Stagg, M.D.[4]

Harford County

Frederick J. Hatem, M.D.[6]
Benjamin Oteyza, M.D.

Howard County

Allan T. Leffler II, M.D.[6]
Melvin S. Rapelyea, M.D.
Charles E. Taylor, M.D.

Kent County

John C. Arrabal, Jr., M.D.
Maria C. Boria, M.D.

Montgomery County

Benjamin Avrunin, M.D.
Carol L. Bender, M.D.[4]
Barbara L. Blaylock, M.D.
David B. Doman, M.D.[1]
Carol W. Garvey, M.D.[2,6]
Joseph J. Genovese, Jr., M.D.[1]
Barton J. Gershen, M.D.[6]
Sarah A. Leonhard, M.D.[1]
Ralph E. Longway, M.D.
Edward S. Mehlman, M.D.
John P. Nasou, M.D.
Alphonsus O. Obayuwana, M.D.[1]
Bruce E. Rubin, M.D.[4]
Philip L. Schneider, M.D.
Mark S. Seigel, M.D.
Peter B. Sherer, M.D.[6]
Margaret T. Snow, M.D.
Joseph Snyder, M.D.[2,6]
Donald S. Stepita, M.D.[6]
Stephen G. Vaccarezza, M.D.
Isaac Weiszer, M.D.[1]
Stephen W. White, M.D.[6]

Prince George's County

Brian S. Bayly, M.D.
Riad Dakheel, M.D.
Stuart J. Goodman, M.D.[1,6]
Zorayda M. Lee-Llacer, M.D.
John Richard Lilly, M.D.
Benjamin Maldonado, M.D.[2,6]
George S. Malouf, Jr., M.D.
Mary B. Maloney, M.D.[1]
George S. Malouf, Sr., M.D.[3,6]
Abdul Nayeem, M.D.[1]
David N. Robb, M.D.
Robert Ruderman, M.D.
Eli A. Sayan, M.D.
Frederick Wilhelm, M.D.[1]

Queen Anne's County

John R. Smith, Jr., M.D.[4]

St. Mary's County

J. Roy Guyther, M.D.[4]
Mohamed F. Lafeer, M.D.

Talbot County

L. Thomas Divillo, M.D.[1,6]
Donald T. Lewers, M.D.[3,6]
Richard R. Stephenson, M.D.[1]

Washington County

Edward W. Ditto III, M.D.
J. Ramsay Farah, M.D.[1,6]

Wicomico County

Alex Azar, M.D.[2,6]
Hilda I. Houlihan, M.D.[6]
Deepak Saggar, M.D.

Worcester County

Federico G. Arthes, M.D.[4,6]

Student Component

Michael D. Huber

Specialty Societies

Jay Gerstenblith, M.D.

[1]Alternate, [2]Officer, [3]AMA Delegate, [4]Delegate and Councilor, [5]Also voting Delegate, [6]Councilor

Past presidents

Raymond M. Atkins, M.D.[5]
Michael R. Dobridge, M.D.
J. Roy Guyther, M.D.[5]
Reynaldo Lee-Llacer, M.D.[5]
Donald T. Lewers, M.D.[5]
George S. Malouf, Sr., M.D.[5]
Roland T. Smoot, M.D.[5]

Also present were the following executive directors:

Neilson Andrews, Baltimore County Medical Association;
Diane Briggs, Prince George's County Medical Society;
Bernadette Lane, Baltimore City Medical Society; and
Edward Shanbacker, Montgomery County Medical Society.

The Faculty's executive director, Angelo J. Troisi, F.A.C.H.E., was present, as well as other members of the Faculty's staff, including Joseph Harrison, associate executive director; Rose M. Matricciani, R.N., J.D., assistant executive director for healthcare policy; and Carmine M. Valente, Ph.D., deputy executive director.

The parliamentarian was William Evans, Esq.

[1]Alternate, [2]Officer, [3]AMA Delegate, [4]Delegate and Councilor, [5]Also voting Delegate, [6]Councilor

Call to order:

The 338th meeting of the House of Delegates for the 1992 semi-annual meeting was called to order by the president and presiding chairperson, Jose M. Yosuico, M.D., at 1:40 p.m. in the Palmetto Rooms 1, 2 and 3 of the Princess Royale Hotel in Ocean City, Maryland.

Invocation

Leslie R. Miles Jr., M.D., chairperson of the Committee on Medicine and Religion, delivered the invocation.

Pledge of allegiance

A videotape provided by the Maryland Public Broadcasting System was played to lead the House of Delegates in a pledge of allegiance.

Approval of minutes

The minutes from the two House of Delegates sessions held during the annual meeting on Thursday, April 30, 1992, and Saturday, May 2, 1992, which had been approved by the Executive Committee, were adopted by the House of Delegates.

Presentation by Joseph T. Painter, M.D.

Joseph T. Painter, M.D., president-elect of the American Medical Association (AMA), thanked the Faculty for its help with "Health Access America."

Dr. Painter stated that the ideas of each state society are very important and that Maryland has strong leaders to carry forth its ideas to the AMA in Dr. Lewers and Malouf. He said that Drs. Lewers and Dr. Wagner were on two important AMA committees—scientific affairs and legislation. He also mentioned that Dr. Lewers was being put forth as a trustee. Dr. Painter added that the AMA needs the knowledge, skills, and experience of Dr. Lewers.

In discussing what the AMA was about, Dr. Painter noted that the other 49 states also have sent forth representatives who are as knowledgeable and skilled as our delegates to the House of Delegates of the AMA. Additionally, 75 specialty societies are included. With these numbers in mind, the viewpoints of the AMA reflect 95 % or more of the doctors in this country. The AMA gains its strength from the people sent forth by the states, and the AMA needs that strength and input. One idea carried out of Maryland can literally change an AMA policy.

Mr. Painter remarked on the importance of communication, stating that the public does not know what it really costs for health care today and doesn't generally like physicians, although individuals like their personal physician. The public doesn't recognize the change in value that has occurred. He also stated that we need to get the public to realize that we are on their side in fighting for the best care. The return to the patient as a number one concern should be the practice focus.

Dr. Painter stated that together, physicians can become a powerful force that can say what is going to happen to medicine. He also announced that "...we must fight those groups that over-regulate us...." He believes physicians must rebuild the ethical network all over the country.

Dr. Painter assured the audience that the AMA also wants to maintain its scientific base; the AMA is seeking to create a strong team.

At the conclusion of Dr. Painter's presentation, the chairperson, Dr. Jose Yosuico, presented Dr. Painter with a certificate of recognition.

Awards

a. Seventh annual media awards

Daily Newspaper Category:

Marlo Barnhard, "Harold Churchey: Man with a vision," *The Herald Mail,* Hagerstown.

Non-Daily Newspaper and Magazine Category:

Jeanne Beach, "Attention Turns to Alzheimer's," Homestead Publishing Company.

Special Mention in the Non-Daily Newspaper and Magazine Category:

Lynne Salisbury, "Balancing Acts: How young people and their families cope with diabetes," *Columbia Flier.*

Radio Category:

Marian Koubek, "An element of danger," WPOC-FM.

Television Category:

Lisa Willis and Scott Livingston, "Around the Clock Care," WBFF-TV.

b. *Maryland Medical Journal (MMJ)* Awards

It was noted that the winners of the *MMJ* awards were Mary Betty

Stevens, M.D., practitioner award, for "Clinical spectrum of SLE," October 1991; and Santa J. Johnston, M.D., resident award, for "Inflammatory pseudotumor of the retroperitoneum," September 1991.

c. Auxiliary awards

The chairperson presented to Elizabeth Lindhardt a governor's citation for her work over the past many years in coordinating the AMA-ERF funds and noted that through her hard work, the three medical schools in Maryland have received almost $300,000 during the past few years. Mrs. Lindhardt was also presented with a certificate of recognition by Med Chi and received flowers from Dr. Jose M. Yosuico, president.

The chairperson presented Mrs. Myrna Goodman, president of the auxiliary, with a governor's citation for the work auxiliary members accomplished in helping with the legislative program. Mrs. Goodman accepted the award on behalf of the auxiliary.

d. Award for Donald T. Lewers, M.D.

The chairperson presented Donald T. Lewers, M.D. with a governor's citation for bringing so much credit to Maryland physicians through his efforts with the AMA and on the various committees he has worked on for the AMA.

e. 50-year award

Dr. Yosuico called I. Rivers Hanson, M.D. to come forward to receive his 50-year membership award. The chairperson also called upon Dr. "Ted" Lewers to assist in the presentation as both physicians were from the same area. After Dr. Lewers made the presentation to Dr. Hanson, Dr. Hanson spoke on some of his experiences during the 50-year period. He stated that one of the most interesting experiences he had was in delivering a baby who was later named Donald "Ted" Lewers. Dr. Lewers thanked him very much for his comments and for the act of delivering him.

Council report

a. Emeritus membership

Joseph Fastow, M.D, chairperson of Council, presented the Council report. Dr. Fastow asked that the reading of the members who wished to be granted emeritus membership be dispensed with since the names were listed in the agenda as follows:

Allegany County
Amado P. Torres, M.D.

Anne Arundel County
Edwin Davis, M.D.
John L. Pitts, M.D.

Baltimore City
Robert M. Heyssel, M.D.

Baltimore County
Morton J. Ellin, M.D.
Bernard S. Gordon, M.D.
Marcos Levin, M.D.
Anthony A. Lewandowski, M.D.
James E. Rowe, Jr., M.D.
Mehdi L. Yeganeh, M.D.

Howard County
Elwood H. LaBrosse, M.D.

Montgomery County
Horace W. Bernton, M.D.
Leo P. Hennigan, M.D.
James L. Laubach, M.D.
Baltazar E. Perez, M.D.

Prince George's County
Bernard F. Peacock, M.D.

Wicomico County
Richard E. Hughes, M.D.

The House of Delegates approved the emeritus membership of the above-mentioned members.

b. Waiver of dues

Dr. Fastow then asked that the following individual be granted a waiver of dues:

Baltimore County
Franklin D. Israel, M.D.

The House of Delegates approved the waiver of dues.

c. Council resolutions

(1) Baltimore County resolution

Dr. Fastow noted that the Council at the July 16 meeting amended a resolution submitted by Baltimore County Medical Association to adopt AMA Report BBB, "Enforcement of the Code of Ethics (I-91)" and forwarded it to the House of Delegates for consideration of adoption.

The resolution states:

> *Resolved*, That the Medical and Chirurgical Faculty of Maryland support the implementation plan of the American Medical Association for enforcement of the code of ethics.

Louis C. Breschi, M.D. of the Baltimore County Medical Association, the association that had presented the resolution, stated that he would like to make a friendly amendment to change the resolution as follows: "...American Medical Association AS OUTLINED IN THE AMA INTERIM REPORT BBB 1991." (changes are in CAPS.)

Dr. Breschi's amendment to the resolution was seconded and passed. The chairperson noted that the question was on the amendment to the resolution to delete "for enforcement of the code of ethics" and to add "as outlined in the AMA Interim Report BBB 1991."

The amendment to the resolution was passed.

The chairperson stated that the question now was on the entire resolution.

Dr. Lewers questioned what the resolution was all about. Dr. Breschi stated it just supported the direction the AMA was going toward on self-regulation. Mr. Angelo J. Troisi, executive director, noted that this resolution, which encompasses Report BBB, has to do with an implementation plan from the AMA to develop a communications system of all the states and of all the specialty societies, etc., with regard to making sure that everyone throughout that entire system is aware of potential ethical problems.

After much discussion, a motion was made to postpone the adoption of this resolution by the House indefinitely. The motion was seconded and passed.

The House of Delegates adopted the position to postpone indefinitely this resolution.

(2) Prince George's County resolution

Dr. Fastow noted that at the July 16 Council meeting, the Council moved and approved to forward a Prince George's County resolution on self-referral to the House of Delegates for adoption.

The resolution states:

> *Resolved,* That the Medical and Chirurgical Faculty of Maryland support current Maryland law (Md. Health Occ. Art. 1-206), the current Faculty Ethical Opinion (§405), and the current AMA position (the New Jersey resolution) approved by the House of Delegates (A92), all of which require disclosure and allow medically necessary referrals to off-site facilities in which physicians have a financial interest; and be it further
>
> *Resolved,* That the Medical and Chirurgical Faculty of Maryland oppose any action which would contradict the aforementioned policy.

Dr. Fastow stated that additionally, Council heard at the July 16 meeting the report of the Committee on Professional Ethics on the same subject as self-referral, and Council referred this issue to the Legislative Committee for review and consideration and directed the Legislative Committee to report recommendations to the House of Delegates at this time.

A mention was made by Baltimore City to add a third resolve as follows:

> *Resolved,* That the Medical and Chirurgical Faculty supports a strong utilization review mechanism administered by the Board of Physician Quality Assurance.

The motion was moved and seconded.

The chairperson stated that the question was on the adoption of the third resolve.

In regard to this resolve, Mr. Troisi noted that there was an amendment to the Board of Physician Quality Assurance Law this year that will be effective October 1, 1992. The "gross and willful overcharging" as grounds for acting on a physician's license has been replaced with "overutilization of medical services." Mr. Troisi noted that Med Chi has supported this bill.

Carol W. Garvey, M.D. of the Montgomery County Medical Society made a motion to amend the resolve presented by Baltimore City to delete "administered by the Board of Physician Quality Assurance." The motion was seconded and the amendment to the amendment was seconded to strike out the words "administered by the Board of Physician Quality Assurance." The amendment to the amendment was passed.

The chairperson noted that the question now was on the adoption of the amendment as amended. A discussion ensued. Dr. Bob stated he was against the resolution and that we should be concerned with professionalism. He noted that Dr. Painter had said, "The heart of professionalism is the adherence to a set of standards and a mode of behavior which is higher than civil law...."

The chairperson recognized Lawrence Holder, M.D. of Baltimore County, president of the Maryland Radiological Society, in as much as Dr. Holder is not a delegate and therefore not a member of the House of Delegates. Dr. Yosuico indicated that on an issue as important as this, he would allow Dr. Holder to speak unless there was any objection. Hearing no objection, Dr. Yosuico recognized Dr. Holder. Dr. Holder stated that Med Chi needed "to foster the unity that we all need...and that we not perpetuate disharmony." Dr. Holder stated that the passage of these resolutions as written would continue to create some confusion and divisiveness.

Dr. Holder continued that the Maryland Radiological Society had some concerns with the title, the current ethical opinion of the AMA Council on Ethical and Judicial Affairs is not referenced in the first resolve, the New Jersey resolution oversimplifies the problem, and in the second resolve, the term "self-referral" means so many things to so many people that this subject cannot be discussed in the abstract. Dr. Holder suggested that in the spirit of harmony, the matter be referred to the Legislative Committee so that when specific issues come up they can be debated.

A discussion then proceeded on the entire matter. Dr. Breschi stated that he would speak against the resolutions. He noted that the subsection number was incorrect in the first resolve.

He stated that Med Chi's current ethical opinion is not §405, but is the one that was passed in March 1992 in support of the AMA resolution to support the Ethical Judicial opinion I-91. He then moved to submit a substitute resolution which was:

> Move to reaffirm the AMA's interim policy on self-referral as accepted and filed in December 1991 and approved by Med Chi Council in March 1992. And further, that the medical society take a neutral position on legislation until the submitted legislation can be reviewed by the Legislative Committee.

The chairperson noted that it had been moved and seconded to substitute the following:

> Move to reaffirm the AMA's policy on self-referral as accepted in December 1991 and approved by Med Chi Council in March 1992 and the medical society take a neutral position until the submitted legislation can be reviewed by the Legislative Committee.

Dr. Azar spoke against the substitute resolution. He commented that he believed that the AMA's position would be the policy approved during the A-92 meeting in Chicago when the House of Delegates adopted Resolution #5 (New Jersey), which allowed for self-referral with disclosure. Dr. Zebley moved to refer the resolutions back to the Legislative Committee for better language, to write them correctly, and

to reintroduce them. The motion was seconded.

Dr. Martinez asked for a point of personal privilege. He noted that this matter had been referred by the Council to the Legislative Committee and had been discussed by the committee, and that the committee had adopted the AMA 1992 position that self-referral was not unethical with disclosure, which he stated was the current Maryland law.

Dr. Blumberg inquired whether Dr. Martinez was making a motion that instead of referring the matter to the Legislative Committee that it be referred to a special committee.

Dr. Martinez stated that he had made no motion and had opposed no motion, but merely stated fact. Dr. Martinez noted that an AMA paper entitled "Physician Self-Referral" states that during the 1982 annual meeting, "the AMA has never advocated the development of legislation and the ethical opinion was not intended to be viewed as a model bill. The Council on Ethics and Judicial Action believes that physicians can be trusted to resolve conflicts appropriately in general. Physician investment has been good for patients." Dr. Martinez noted that he has talked to the chairperson of the AMA Council on Ethical and Judicial Affairs, who reassured him that there is a fundamental difference in having an ethical opinion that guides your behavior, and having a policy decision that makes your behavior.

Dr. Stagg spoke against the resolution. He noted that this was not a matter of legislation, but a matter of policy.

Dr. Bob stated that we needed to look at the ethical view as well as the legislative view and revise them. He moved that Dr. Zebley's motion be amended to send this to an ad hoc committee to study, rather than have a blanket ethical or unethical statement.

The chairperson noted that it had been moved and seconded to strike out the Legislative Committee and insert a special committee appointed by the president. The question was called. It was announced that the issue failed. The matter will not be referred to a special ad hoc committee. The House asked for a recount of votes. Drs. Fastow and Atkins were appointed as tellers, and delegates were asked to stand to vote. On re-count, the motion was adopted that states: A special committee to study the self-referral issue will be appointed by the president. The matter will not be referred to the Legislative Committee.

It was noted that other matters on this issue were pending. It was then moved to send this and all pertaining matters to be addressed to the ad hoc committee for further report.

d. Physician x-ray aide program

Dr. Fastow reported on the physician x-ray aide program. He stated that Med Chi has been successful in obtaining interest from several community colleges to deliver the course and examination once the examination has been approved by the Maryland Radiological Society. He noted that in order to assist the community colleges, Med Chi was conducting a survey of its membership to determine the number of individuals who need training, and their time considerations and locality needs, and that survey forms had been sent to all Med Chi physicians. He asked physicians to pick up a survey form and return it to the registration desk.

Legislative Committee Report

Jose Martinez, M.D., chairperson of the Legislative Committee, presented the committee's report. He noted that the Legislative Committee had taken a number of actions. Dr. Martinez noted that of the three issues he was originally going to discuss, the issue of self-referral had already been disposed of by the House of Delegates by referring it to a special committee.

The second issue on acupuncture was referred by Council on September 18.

Dr. Martinez noted that the remaining issue concerned the abortion issue, which was presented to the Legislative Committee by Dr. Goodman. Dr. Martinez presented the Legislative Committee motion for discussion by the House of Delegates:

That the Legislative Committee refers to the House the decision to debate the obligations of Med Chi with reference to adopting a position with regard to Referendum Question No. 6 dealing with termination of pregnancy and to recommend a policy.

Dr. Blumberg noted that Dr. Goodman had made a motion to the Legislative Committee that Med Chi take a public position of support, based on public health considerations, for the "yes" position on Referendum Question No. 6, regarding the termination of pregnancy under the state abortion law. However, Dr. Blumberg stated that Med Chi should debate on whether to take a position on Referendum No. 6 and what that position should be.

Dr. Blumberg made a motion that Med Chi publicly support the passage of Referendum No. 6.

Dr. Shochet stated that Baltimore City Medical Society believed Med Chi should take a different position and made a substitute motion: The physicians of Maryland do not advocate abortion. However, we believe there should be greater emphasis on the availability of education and the means to prevent pregnancy. Further, we believe that it is imperative that any surgical procedure, including abortion, be performed in a sterile atmosphere and only after the patient has undergone counseling, including the consideration of alternatives to the procedure.

The chairperson noted that this was a substitute motion and received an appropriate second.

A motion was made to amend by adding at the end of the substitute motion, "Med Chi is in support of Referendum No. 6."

Dr. Hatem of the Harford County Medical Society spoke against the motion and made a substitute motion that the medical society take no position on Referendum No. 6 on abortion. The chairperson noted that was not a motion that could be accepted since by voting "no" on the question would mean that we would take no position. Dr. Hatem stated he believed there was a difference. He stated he wanted to make a substitute motion: "I move Med Chi have no position on abortion." That motion was seconded.

Several physicians spoke in favor of taking no position.

The chairperson called the question.

The House of Delegates passed the substitute motion made by Dr. Hatem that Med Chi take no position on abortion.

Committee reports

The chairperson noted that the committee reports contained no recommendations or resolutions and that all of them were for the 1991-1992 organizational year.

Maryland Medical Political Action Committee report

John Lynn, M.D., chairperson, Maryland Medical Political Action Committee (MMPAC), noted that in 1992, MMPAC received the American Medical Political Action Committee (AMPAC) award for being the society with the second highest increase in members and the third highest in increased revenue. Dr. Lynn noted that MMPAC needed everyone's support, that it was each physician's responsibility to act as an advocate in health matters, and that to do this, physicians need to join AMPAC and MMPAC. Dr. Lynn stated that these groups speak on upcoming changes and that in January 1993, issues on national health care will be discussed.

Treasurer's report

Albert Blumberg, M.D., treasurer, asked that the certification of the accountants with respect to the annual report be approved. The auditors reported that the financial statements represent fairly, in all material respects, the financial position of the Medical and Chirurgical Faculty at December 31, 1991, and 1990, and the results of its operations, changes in fund earnings, and cash flows for the year then ended are in conformity with generally accepted accounting principles.

Dr. Blumberg noted that under the previous chairperson to the Finance Committee, Dr. Bearman, a change was made in the custodian for the endowment and pension funds. Med Chi is no longer paying a fee to have these accounts handled, and this has resulted in an annual saving of $24,000 to Med Chi on administration fees.

The House approved the certification of accountants. Dr. Blumberg noted that Med Chi was solvent.

Policy resolutions

The chairperson called upon Carol W. Garvey, M.D., secretary, to read the staff report on the review of policy resolutions adopted five years ago. Dr. Garvey asked that the House reaffirm the following resolutions adopted in 1987:

Resolution 1A/87

Resolved, That the Medical and Chirurgical Faculty go on record as encouraging its members and, indeed, all of the physicians of Maryland, to maintain as their top priority the quality care of each individual patient, and that should there be a conflict between quality of care and regulations promulgated by the Delmarva PRO, quality care must always take precedence.

Resolution 1S87 (a)

Resolved, That all members of the Medical and Chirurgical Faculty of Maryland will demonstrate a continuing interest in providing quality care for the elderly by actively studying the issues, opposing policies detrimental to quality, accessibility and availability of appropriate care for all Americans and constantly evaluating the health care needs of the elderly citizens of Maryland.

Resolution 1S87 (b)

Resolved, That the standards of treatment for elderly citizens as well as all Marylanders shall not be compromised due to political concerns not in the best interests of the individual patient's well-being or continued high quality of life.

Resolution 1S87 (c)

Resolved, That all members of the Medical and Chirurgical Faculty will continue to exhibit sensitivity and responsiveness to the financial status of the elderly population and will consider the patient's financial situation when making a determination whether or not to accept Medicare assignment.

Hearing no objections, the chairperson stated that the resolutions would remain in effect.

Reference Committee report

Ralph E. Longway, M.D. stated that the Reference Committee held a public hearing on three resolutions that had been submitted for action, two from Prince George's County Medical Society and one by an individual physician.

a. Firearms injuries and deaths resolution

The first resolution entitled "Firearms Injuries and Deaths," submitted by Prince George's County Medical Soci-

ety, was presented to the House for adoption as follows:

> *Resolved,* That the American Medical Association draft and use its best offices to have enacted national legislation to require that the owner and operator of a firearm meet certain criteria, similar to the criteria that the owner and operator of a motor vehicle must meet, i.e., be of a certain age, physical and mental condition, and be required to demonstrate knowledge and skill in proper use of that firearm.

Dr. O'Mansky stated that the Baltimore City delegation supported the resolution. Dr. Lilly stated that Prince George's County delegation supported the resolution. Dr. Edery from the Baltimore County Medical Society stated that the society should adopt this resolution.

An amendment to this motion was made by Dr. Gillman to add as follows:

> We urge our state legislators to consider a significant tax on handguns and bullets to help offset the cost of violence in our streets which is increasing.

The amendment, which was seconded, was adopted by the House of Delegates.

Dr. Hatem made a motion to reconsider the issue of the new tax. The chairperson stated that the question is to reconsider the vote on the amendment.

The House passed the motion to reconsider the added amendment regarding a tax. After some discussion, there was a call for the question and the House of Delegates did not adopt the amendment that included the tax.

The original motion was now on the floor. The question was called.

The motion was approved by the House of Delegates as originally submitted.

The resolution was adopted by the House of Delegates as originally submitted, which was:

> *Resolved,* That the American Medical Association draft and use its best offices to have enacted national legislation to require that the owner and operator of a firearm meet certain criteria, similar to the criteria that the owner and operator of a motor vehicle must meet, i.e., be of a certain age, physical and mental condition, and be required to demonstrate knowledge and skill in proper use of that firearm.

b. Imprinting of solid oral dosage form drug products

Dr. Longway then presented the second resolution to be considered, entitled, "Imprinting of solid oral dosage form drug products," submitted by the Prince George's County Medical Society as follows:

> *Resolved,* That the Medical and Chirurgical Faculty of Maryland adopt as its policy an intention to see legislation introduced into the Maryland General Assembly calling for the statutory requirement of imprinting for identification of all generic solid oral drug products.

After some discussion, the question was called and the resolution was adopted as submitted.

c. Litigation initiation fund

The resolution, submitted by Robert Ruderman, M.D., entitled "Litigation initiation fund, read as follows:

> *Resolved,* That the fund be financed by a one-time $100 assessment of each Med Chi member; and be it further
>
> *Resolved,* That new members be assessed during their second year of membership and that resident and medical student members be absolved from the assessment; and be it further
>
> *Resolved,* That the fund be administered separately from the general fund by a distinct board appointed by the Council of the Medical and Chirurgical Faculty of Maryland.

The question was called and the resolution was not adopted.

Bylaws report

Alex Azar, M.D., chairperson of the Bylaws Committee, presented the committee's report and recommended adoption of all of the items. He noted that Items 8a and b had been withdrawn for further evaluation.

After the report was presented, Items 3, 4, 6, and 7 were extracted.

The chairperson asked for a vote on Items 1, 2, 5, 9, 10, and 11. These items were adopted by the House of Delegates and were as follows:

1. Article III—Finance, Section 3.

Section 3. Within 30 days of the admission of a new member by a component society, that component society shall forward to the Faculty the member's name, address, and date of admission with the appropriate dues. In the case of a member who has transferred his membership, the component society to which his/her membership has been transferred shall forward to the Faculty the member's name, address, and date of admission, stating the name of the component society from which the member transferred.

2. Article I—Component societies, Section 4.

Section 4. Component societies shall be the judges of the qualifications of their own active members, provided that (apart from any component society composed exclusively of student members) they may admit to membership every reputable and legally registered doctor of medicine who does not practice, claim to practice, or support any exclusive system of medicine and who (1) is not an active member of another component society, (2) practices medicine within the component society's geographical area, and/or (3) maintains his/her residence within its area. If, due to moving either his/her practice or residence, a physician becomes ineligible to continue his/her membership in a component society, his/her membership must be transferred (to the

appropriate component society within 60 days) unless the physician wishes to retain his/her current membership.

5. Article VII—Council, Section 3.

Section 3. Immediately following the close of the annual session of the House of Delegates, the Council shall elect a chairperson and vice chairperson from among its own membership who shall serve for one year or until their successors are elected. The Council chairperson shall act as "speaker" of the Council and shall assume duties related to the accomplishment of the business of the Council. It shall be the duty of the chairperson to preserve order and to follow proper parliamentary procedures. The chairperson shall ensure the smooth flow of information during Council meetings, ensuring the voice of the minority is heard as well as the will of the majority is assured. The chairperson will ensure the free exchange of all debate and ensure committees report with clarity. The Council chairperson shall act as moderator for all Council debates. The chairperson's duties are confined to this role, and exclude any relationships with outside agencies except as designated by the president.

9. Article XI—Committees, Section 27 (new) Mediation Committee

Section 27. A mediation committee shall consist of not less than nine members who shall serve on a three-year staggered-term basis. The president shall select one-third of its members each year for a three-year term. The president will also appoint the chairperson. The committee shall be responsible only for the mediation of fee disputes referred by the Board of Physician Quality Assurance under guidelines and procedures developed by this committee and approved by Council. No member of this committee may serve concurrently on a peer review committee of the Faculty or a component society while a member of the committee.

10. Article XIV—Parliamentary authority

The rules contained in the current edition of *Rules of Order* by James E. Davis, M.D. shall govern the Faculty in all cases to which they are applicable and in which they are not inconsistent with these Bylaws. In the event an issue is not addressed in the rules of order, then *Robert's Rules of Order Newly Revised* shall govern the faculty.

11. Article XI—Committees, Section 6(a)

Section 6. Section 6. Approximately half of the delegates and alternates to the American Medical Association

(a) shall be nominated and elected in the same manner and at the same time as that provided for the elective officers. Their terms shall begin on January 1 of the year following their election and they shall serve for a term of two years or until their successors are elected, provided that this provision shall be implemented in a manner that does not shorten the term of any delegate elected prior to its adoption.

The chairperson then called on Dr. Azar to read each extracted item for discussion. Dr. Azar presented the following items:

3. Proposed Bylaw Amendment to Article VIII—Executive committee, Section 1.

Rationale: Increasing the size of the Executive Committee by including the elected vice presidents and chairperson of the AMA delegation would make the Executive Committee more democratic and allow for additional representation. It would also make it more difficult for an individual or small group of individuals to dominate the affairs of the society and would allow the elected vice presidents to be more active in the Faculty's affairs.

Including the chairperson of the AMA delegation on the committee would provide the input of the AMA on issues affecting the Faculty.

Amend Article VIII, Section 1 as follows: (CAPS indicate change.)

Section 1. The Executive Committee shall consist of the president, the president-elect, the immediate past president, the secretary, the treasurer, THE CHAIR OF THE AMA DELEGATION, THE THREE VICE PRESIDENTS, and the chairperson and vice chairperson of the Council.

Discussion: Substitute amendments were introduced by the Baltimore County Medical Association and the Montgomery County Medical Society but were ruled out of order by the parliamentarian because they had not been presented within the 30-day announcement period. A recommendation was made to refer the amendment back to the Bylaws Committee. After some discussion, the motion was deferred and the original motion presented by the Bylaws Committee was called and adopted by a majority vote.

The amendment was adopted by the House of Delegates as follows:

Section 1. The Executive Committee shall consist of the president, the president-elect, the immediate past president, the secretary, the treasurer, the chairperson of the AMA Delegation, the three vice presidents, and the chairperson and vice chairperson of the Council.

4(a). Proposed Bylaw Amendment to Article IV—Officers, Section 1.

Rationale: To more clearly define the role of the president of Med Chi. (If approved, this section shall be effective after the conclusion of the 1993 annual meeting.)

Amend Article IV, Section 1 as follows: (CAPS indicate change.)

Section 1. The elective officers shall be a president, a president-elect, a first, second, and third vice president, a secretary, and a treasurer. THE PRESIDENT SHALL BE THE OF-

FICIAL SPOKESPERSON FOR THE FACULTY AND PRESIDE OVER THE MEETINGS OF THE HOUSE OF DELEGATES. THE PRESIDENT SHALL BE RESPONSIBLE FOR REPRESENTING THE FACULTY IN ALL MATTERS CONCERNING THE OPERATIONS OF THE FACULTY AND AS SUCH WILL BE THE OFFICER RESPONSIBLE FOR THE COORDINATION OF ALL FACULTY PROGRAMS WITH OUTSIDE AGENCIES, TO INCLUDE BUT NOT BE LIMITED TO: THE MARYLAND GENERAL ASSEMBLY, MEMBERS OF THE US CONGRESS, ALL STATE DEPARTMENTS, AND OTHER OFFICERS AND AGENCIES DEALING WITH THE FACULTY. THE PRESIDENT MAY DELEGATE ANY OF THESE DUTIES TO THE PRESIDENT-ELECT OR OTHER OFFICERS FOR CERTAIN EVENTS OR PERIODS OF TIME, BUT REMAINS RESPONSIBLE FOR THE EFFICIENT OPERATION OF THE PROGRESS OF THE FACULTY. THE PRESIDENT-ELECT SHALL ASSUME THE DUTIES OF THE PRESIDENT DURING ABSENCES OR PERIODS WHEN THE PRESIDENT IS UNABLE TO PERFORM THE DUTIES OF THE OFFICE.

The amendment was adopted by the House of Delegates.

4(b). Proposed Bylaw Amendment to Article VIII—Executive Committee, Section 3.

Rationale: In order to be consistent with Item 4(a) Article IV—Officers, there would be a need to change Section 3 to make the president, chairperson of the Executive Committee. The amendment also increases the quorum to six members instead of three. (If approved, this section shall be effective after the conclusion of the 1993 annual meeting.)

Amend Article VIII, Section 3 as follows: (CAPS indicate change, [ ] indicate deletion.)

Section 3. The Executive Committee shall meet at the call of the [chairperson of the Council] PRESIDENT or [two] SIX of its members. The [chairperson of the Council] PRESIDENT shall be chairperson. A quorum of the Executive Committee shall be [three] SIX of its members.

Discussion: A motion was made to make a substitute amendment to have the quorum be four instead of six. This motion was defeated.

The amendment was adopted by the House of Delegates as follows:

Section 3. The Executive Committee shall meet at the call of the president or six of its members. The president shall be chairperson. A quorum of the Executive Committee shall be six of its members.

6. Proposed Bylaw Amendment to Article IX—Board of Physician Quality Assurance, Section 2.

Rationale: Changes required by statute approved during the 1992 General Assembly.

Amend Article IX, Section 2 and add new Section 3 as follows: (CAPS indicate change, [ ] indicate deletion.)

[*Section 2.* Replacement members of the Board of Physician Quality Assurance to be seated each year shall be presented at the first meeting of the annual session of the House of Delegates, and twice the number of vacancies to be filled for that specific year shall be voted upon as the list of nominees to be submitted to the governor for appointment to the board. Vacancies on the board caused by death, resignation, or removal from office, shall be filled in accordance with the current Bylaws.]

SECTION 2. EACH YEAR PRIOR TO THE EXPIRATION DATE SET BY LAW FOR TERMS OF BOARD MEMBERS, FOR EACH IMPENDING INITIAL VACANCY, THE FACULTY SHALL NOTIFY ALL LICENSED PHYSICIANS IN THE STATE TO SOLICIT NOMINATIONS TO FILL THE VACANCY AND SHALL CONDUCT A BALLOTING PROCESS THAT PROVIDES ALL PHYSICIANS IN MARYLAND WITH AN EQUAL VOTE TO SELECT THE NAME OF THE LICENSED PHYSICIAN TO BE SUBMITTED TO THE GOVERNOR.

SECTION 3. ONCE APPOINTED TO THE BOARD, A PHYSICIAN NAMED ON THE LIST SUBMITTED BY THE FACULTY SHALL REMAIN ON THE LIST FOR TWO CONSECUTIVE FULL TERMS.

Discussion: A motion was made to add after "...balloting process" the words, "by the Executive Committee." The motion to amend the amendment was seconded and passed.

A motion was made to extract Section 3 of the amendment, which was approved. After discussion, which included the fact that Sections 2 and 3 were extracted verbatim from SB 674, the amended amendment was approved by the House of Delegates as follows:

Section 1. The Board of Physician Quality Assurance is composed of 15 active members, of which ten of its members shall be physicians recommended by the Faculty. It has such powers, duties, officers and meetings as are provided from time to time by law.

Section 2. Each year prior to the expiration date set by law for terms of board members, for each impending initial vacancy, the Faculty shall notify all licensed physicians in the state to solicit nominations to fill the vacancy and shall conduct a balloting process by the Executive Committee that provides all physicians in Maryland with

an equal vote to select the name of the licensed physician to be submitted to the governor.

Section 3. Once appointed to the board, a physician named on the list submitted by the faculty shall remain on the list for two consecutive full terms.

7. Proposed bylaw amendment to Article XI—Committees, Section 14, Legislative Committee

Rationale: Clarification of the role of the Legislative Committee.

Amend Article XI, Section 14 as follows: (CAPS indicate change, [ ] indicates deletion.)

[*Section 14.* A Legislative Committee shall consist of at least five members appointed by the president; one of whom the president shall designate as chairperson, together with the immediate past president (to act as liaison with the Council) and one member of each component society and specialty society, recognized by the Faculty, who are members in good standing of the Faculty, chosen by those societies annually. The Maryland Dental Association and the Auxiliary of the Medical and Chirurgical Faculty of Maryland shall have the right to choose one associate member of the committee. The committee shall inform itself on all legislation, national, state, and local, affecting the practice of medicine; advise the Faculty when necessary in regard to such legislation; and with the president or such other person as the Council or House of Delegates may name, represent the Faculty before any legislative body when required. This committee shall review all regulations, proposed by promulgation by any department or agency of the state of Maryland, affecting the practice of medicine, refer such proposed regulations to any standing committee of the Faculty having jurisdiction thereof, or, if there is no such standing committee, take jurisdiction of the subject matter itself and devise and develop a position on behalf of the Faculty with respect to any such proposed regulation.]

SECTION 14. A LEGISLATIVE COMMITTEE SHALL CONSIST OF THREE MEMBERS APPOINTED BY THE PRESIDENT, ONE OF WHOM SHALL BE DESIGNATED AS CHAIRPERSON, THE IMMEDIATE PAST PRESIDENT ACTING AS LIAISON WITH THE COUNCIL, A MEMBER OF THE FACULTY'S AMA DELEGATION DESIGNATED BY THE PRESIDENT ACTING AS LIAISON WITH THE AMA, ONE MEMBER FROM EACH COMPONENT SOCIETY, INCLUDING THE RESIDENT AND STUDENT COMPONENTS, ONE MEMBER FROM EACH SPECIALTY SOCIETY DESIGNATED BY THE SPECIALTY SOCIETY, ONE ASSOCIATE MEMBER DESIGNATED BY THE AUXILIARY OF THE MEDICAL AND CHIRURGICAL FACULTY OF MARYLAND, ONE ASSOCIATE MEMBER DESIGNATED BY THE MARYLAND STATE DENTAL ASSOCIATION. ALL SUCH MEMBERS, IF MEMBERS OF MED CHI, SHALL HAVE THE PRIVILEGES OF VOICE AND VOTE. GUESTS AND OBSERVERS MAY BE INVITED AT THE PLEASURE OF THE CHAIRPERSON AND SHALL HAVE THE PRIVILEGE OF THE FLOOR IF RECOGNIZED BY THE CHAIRPERSON. THEY SHALL NOT HAVE THE PRIVILEGE OF VOTING. THE COMMITTEE SHALL INFORM ITSELF OF ALL LEGISLATION, INTRODUCED IN THE MARYLAND HOUSE AND SENATE, AFFECTING THE PRACTICE OF MEDICINE, ADOPT A POSITION WITH RESPECT TO SUCH LEGISLATIVE PROPOSALS, REPORT SUCH POSITIONS TO COUNCIL, AND, WHERE APPROPRIATE, SEEK THE ADVICE AND CONSENT OF COUNCIL. WHEN REQUIRED THE COMMITTEE SHALL BE PRIMARILY RESPONSIBLE FOR DEVELOPING TESTIMONY AND REPRESENTING THE FACULTY BEFORE LEGISLATIVE BODIES ALONG WITH THE PRESIDENT OR SUCH OTHER PERSON AS THE COUNCIL OR HOUSE OF DELEGATES MAY NAME. THE COMMITTEE SHALL ACT SIMILARLY ON ANY FEDERAL LEGISLATION, NOT WITHIN THE JURISDICTION OF A STANDING COMMITTEE OF THE FACULTY AND WHEN REQUESTED ASSIST IN DEVELOPING AND PRESENTING TESTIMONY TO FEDERAL LEGISLATIVE BODIES. THE COMMITTEE, WHEN REQUESTED, MAY ASSIST THE COMPONENT SOCIETIES IN RESPONDING TO LOCAL LEGISLATIVE INITIATIVES. WHEN DIRECTED BY THE EXECUTIVE COMMITTEE, THE COMMITTEE SHALL TAKE JURISDICTION OF A REGULATORY ACTIVITY NOT WITHIN THE JURISDICTION OF A STANDING COMMITTEE OF THE FACULTY AND DEVELOP A POSITION AS WELL AS, IF APPLICABLE, PRESENT TESTIMONY IN FRONT OF THE APPROPRIATE REGULATORY BODY WITH RESPECT TO SUCH PROPOSED REGULATION.

Discussion: After a great deal of discussion and debate, the recommendation of the Bylaws Committee was not approved by the House of Delegates.

The amendment was not approved by the House of Delegates.

8(a). Proposed Bylaw Amendment to Article XI—Committees, Section 25, Peer Review Committee

8(b). Proposed Bylaw Amendment to Article XI—Committees, Section 27, Physician/Patient Relations Committee

The two amendments were withdrawn by the Bylaws Committee at the request of the Peer Review Management Committee for further study.

AMA report

George S. Malouf, Sr., M.D., chairperson of the Faculty's AMA Delegation, noted that included in the packet was information regarding the last AMA meeting and that it was not necessary for him to give a verbal report.

Other business

Dr. Yosuico recognized Carol Bender, M.D., Montgomery County Medical Society, who made a motion, which was seconded and passed, that the House of Delegates direct the Faculty's officers and staff to inform legislators in Annapolis that:

1. Med Chi reaffirms its support of

   A. The current 1991 Maryland state disclosure law, and

   B. Senate Bill 654, The Board of Physician Quality Assurance bill, which provides a mechanism to monitor and censure over-utilization, and

2. Med Chi has established a special ad hoc committee to continue to study this very complicated and constantly evolving issue of self-referral to examine the effectiveness of the current Maryland laws (as stated above), and that this ad hoc committee will continue to study this issue of self-referral legislation.

It was agreed that this position would be presented during the September 22 hearing by Senator Paula Hollinger's Subcommittee on Medical Affairs of the Senate Economic and Environmental Affairs Committee who studied the issue and had held a meeting among principal personnel regarding self-referral, and Senator Hollinger will be informed that a position had been taken during the Faculty's semiannual meeting by the House of Delegates. The motion was seconded and passed as presented.

Adjournment

There being no further business, the House of Delegates was adjourned *sine die* at 4:20 pm.

Respectfully submitted,

CAROL W. GARVEY, M.D.
Secretary ■

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872 or 1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ **announcements for physician placements in the classified advertisements are charged at the regular classified advertising rate.**

Members in the News

B. STANLEY COHEN, M.D. was awarded the American Academy of Physical Medicine and Rehabilitation Recognition Award for Distinguished Clinicians. This award honors physiatrists who have achieved distinction through scholarly teaching and outstanding performance in patient care activities. Dr. Cohen is clinical professor of neurology at the University of Maryland School of Medicine. He received his medical degree from the University of Maryland and completed an internal medicine internship and residency at Sinai Hospital of Baltimore and the V.A. Hospital in Bronx, New York, and a physical medicine and rehabilitation residency at Baylor University Medical Center in Dallas, Texas. Dr. Cohen was formerly president and chief executive officer of Sinai Hospital of Baltimore and a former chairperson of the American Board of Physical Medicine and Rehabilitation. He is a member of many societies and organizations.

MARIA L. DEL ROSARIO, M.D. was elected president of the Charles County Medical Society. This is the second time in the history of the medical society that a woman has been elected as president.

Dr. del Rosario was born in the Philippines and received her medical degree from the University of Santos Thomas School of Medicine in that country. Her undergraduate training was completed in Manilia. She completed an internship at the Lutheran Medical Center in Brooklyn, New York, and completed residencies in obstetrics and gynecology at Francis Scott Key Medical Center in Baltimore and Lawrence Memorial Hospital in Connecticut. Dr. del Rosario is active in many professional and civic associations.

A. LEE DELLON, M.D. was president of the American Society for the Peripheral Nerve for 1992. He is an associate professor of plastic surgery with a joint appointment in neurological surgery at the Johns Hopkins Hospital. After receiving his bachelor's degree from the Johns Hopkins University, Dr. Dellon received his medical degree from the Johns Hopkins University School of Medicine. He completed his internship and assistant residency in general surgery at the Columbia-Presbyterian Hospital and his plastic surgery of general surgery residency at the Johns Hopkins Hospital.

Dr. Dellon is also currently an associate professor of neurological surgery at Johns Hopkins Hospital, an attending hand surgeon and attending plastic surgeon at Union Memorial Hospital, and an attending plastic surgeon at Children's Hospital. He is a member of numerous societies, including the Baltimore City Medical Society, and a prolific writer who has authored numerous journal articles.

ALBERT FOLGUERAS, M.D. was elected president of the St. Agnes Hospital Medical Staff. Dr. Folgueras received his medical degree from the University of Madrid Medical School, Madrid, Spain. He served his internship in general surgery at St. Agnes Hospital and in orthopaedic surgery at the University of Maryland Hospital. Dr. Folgueras is a member of the attending staff at both St. Agnes Hospital and James Lawrence Kernan Hospital. He is a fellow of both the American Academy of Orthopaedic Surgeons and the Interamerican College of Physicians and Surgeons. — Other officers elected to serve on the medical staff in 1993 are Adolfo M. Alonso, M.D. as president-elect and Ethan J. Spiegler, M.D. as secretary/treasurer.

C. EARL HILL, M.D. was elected vice president of the American Academy of Family Physicians (AAFP). Dr. Hill is a family physician and associate professor in the family medicine department at the University of Maryland at Baltimore. He received his medical degree from the University of Maryland School of Medicine and completed his internship at St. Agnes Hospital. Dr. Hill has served in numerous capacities, on both the state and national level, for the Academy of Family Physicians. He is also a member of the American Medical Association, the Anne Arundel County Medical Society, and the Accreditation Council on Graduate Medical Education. Dr. Hill has published several times. He resides in Baltimore with his wife, Enola, and has four children, Karen, Vincent, Patrick, and Steven. ■

EASTERN SHORE, MARYLAND:

New hospital opening late Spring of 1993 on Maryland's Eastern Shore, serving a dynamic community on the Atlantic Ocean. We have opportunity for BC/BP, residency trained physicians in Emergency Medicine. Excellent salary and benefit package. Qualified candidates send C.V. to James A. D'Orta, M.D., 199 Lionhead Court, Baltimore, MD 21237. Fax or Tel: (410) 686-2124.

DIRECTORSHIP OF NEW HOSPITAL EMERGENCY DEPARTMENT:

The Atlantic General Hospital, serving the community on Maryland's Eastern Shore, will open its doors in May of '93. Professional Emergency Physicians is seeking BC/BP physician, residency trained in Emergency Medicine, for Director of new hospital Emergency Department starting in the Spring of 1993. Excellent salary and benefits with partnership in our emergency medicine physician owned corporation. Send C.V. to Search Committee, James A. D'Orta, M.D., 199 Lionhead Court, Baltimore, MD 21237, Fax or Tel: (410) 686-2124.

FAMILY PRACTICE PHYSICIAN

Large family practice with offices in Montgomery and Carroll Counties, Maryland has an opening for a full time physician specializing in Family Practice.

Please contact Mr. Ardell Butler, Administrator for further information:

Montgomery Medical Group, PA

The Best Seat In The House.

The NEW TA-AV670 Integrated Amplifier from Sony.

With Sony's advanced Digital Signal Processing, you can create the acoustics of a Stadium, Theater, Concert Hall, Jazz Club and more. Designed to integrate all your audio and video components into one sophisticated system controlled by one remote, this state-of-the-art amplifier incorporates the movie theater sound of Dolby Pro Logic Surround processing, high power and unprecedented control flexibility. With the NEW TA-AV650, the best seats in the house, are **in** your house.

For a complete home theater system, call the *Audio Architects*™ at Soundscape. Free, expert telephone consultations available.

STATE OF THE ART

DIAGNOSTIC TECHNOLOGY

Magnetic resonance imaging (MRI) is an important tool for today's physician. MRI produces VIVID images of the body in multiple planes. It is a painless procedure that does not involve surgery or potentially harmful radiation. MRI is frequently recommended for evaluation of neural, spinal, articular and pelvic disorders. It is safe and cost effective, and its various applications are being expanded at an impressive rate.

Health Images facilities are a community resource available to all area physicians.

Auxiliary

Mammography, your best weapon

Throughout 1991 and 1992, the auxiliary has focused on the need for early detection of breast cancer. Mammography, self-examination, education, and research have all been part of this program. As a grand finale for these public relations activities, a billboard campaign was launched for October 1992—Breast Cancer Awareness Month. "One in Nine" billboards were made available through the Southern Medical Association Auxiliary, in conjunction with its own program on breast cancer. "Mammography, Your Best Weapon" is graphically portrayed on billboards all over Maryland.

The first two were sponsored by Med Chi and, in September, were placed on both sides of Route 50 on the way to Ocean City. Those who attended Med Chi's semiannual meeting at the shore saw these special billboards, which were placed near the road in well-traveled areas. Interestingly, Med Chi's admonition about the dangers of cancer was juxtaposed with a cigarette advertisement complete with the surgeon general's warning.

Washington County Auxiliary, sponsored by Y-ME of Cumberland Valley (a breast cancer support group), had the first billboard for October. Baltimore City Auxiliary placed three billboards in strategic locations, with President Adriana Zarbin giving strong support. Harford County, under the guidance of Ching Barretto, State Health Projects co-chairperson, has a billboard prominently displayed. Georgia Lizas of Frederick County Auxiliary and president-elect of the state auxiliary made the billboard one of her priorities. Howard County boasts three sites—two sponsored by the Breast Health Center of Howard County General Hospital and Auxiliary. In Prince George's County, Dr. and Mrs. John Lynn spurred the purchase of two billboards. Dr. and Mrs. Joseph Snyder of Montgomery County supported the project for their county. Other county auxiliaries are considering billboards for the month of March in honor of Doctor's Day on the 30th.

The project has been received with outstanding enthusiasm. Our thanks go to Med Chi, the county auxiliaries and medical societies, and the Southern Medical Association Auxiliary. This message should go to all wives, sisters, and daughters, as well as to husbands, fathers, brothers, and sons who care. (See photo on next page.)

MILDRED TAYLOR
State Health Projects co-chairperson ■

Figure 1. The Med Chi–sponsored billboard on Route 50 is juxtaposed with a cigarette advertisement including the surgeon general's warning about cancer.

Figure 2. L to R—Mildred Taylor, Madrian Snyder, Betty Molz, Vivian Lynn, Denise Cann, and Myrna Goodman hold a mock-up of the "One in Nine" billboard.

Congratulations and good wishes to Mildred Taylor, president-elect of the Southern Medical Association Auxiliary, soon to be president.

MARYLAND

The Auxiliary always welcomes new members.

Auxiliary members support the physicians and are recognized for their contributions to health, education, and the promotion of quality health care in Maryland.

For information on becoming a member, call JoAnn Troisi at Med Chi's Auxiliary office.

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

Miscellaneous meetings

Maryland Academy of Family Physicians first semiannual meeting, at Hyatt Regency Inner Harbor Hotel, Baltimore, MD. 10 Cat 1 AMA/PRA credits; 10 AAFP prescribed hours. Fee: $100 MAFP members; $150 nonmembers; $60 paramedicals; No charge for residents, medical students, and MAFP life and retired members. Info: William P. Jones, M.D., 410-747-1980. — **Jan. 30–31**

Future relationship between community and university hospitals, sponsored by the Baltimore City Medical Society, at the Union Memorial Hospital, Baltimore, MD. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Feb. 4**

The cost of medicine in the future, sponsored by the Baltimore City Medical Society, at the University of Maryland Westminster Hall. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **Mar. 4**

Clinical dilemmas in pulmonary practice, sponsored by the American Lung Association of Maryland and the Maryland Thoracic Society. 7 Cat 1 AMA/PRA credits. Info: Anne Eder, 410-560-2120 or toll free in MD, 800-492-7527. — **Mar. 7**

Headache in the decade of the brain symposium, presented by the Comprehensive Headache Center at the Germantown Hospital and Medical Center in Philadelphia, PA. 6 Cat 1 AMA/PRA credits. Info: 215-951-8926. — **Mar. 27**

Laboratory workshop in breast reconstruction, at the Sentara Norfolk General Hospital, Norfolk, VA. Info: 804-446-6140. — **Mar. 25–27**

Hands-on workshop on advanced diagnostic methods in andrology, at the Jones Institute of Reproductive Medicine, Norfolk, VA. Info: 804-446-6140. — **Apr. 8–9**

Thrombolysis: Its role in peripheral, arterial and venous disorders, at the Omni International Hotel, Norfolk, VA. Info: 804-446-6140. — **Apr. 23**

195th annual meeting of the Medical and Chirurgical Faculty of Maryland, at the University of Maryland Center of Adult Education, College Park, MD. Info: Betsy Newman, 410-539-0872 or 1-800-492-1056. — **Apr. 30–May 2**

Practical aspects of forensic medicine, sponsored by the Baltimore City Medical Society, at the Montebello Rehabilitation Hospital, Baltimore, MD. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **May 6**

Practical dermatology for the primary care physician —19th edition, at the Ritz-Carlton Hotel, Pentagon City, VA. Info: 804-446-6140. — **May 6–9**

Virginia Society of Otolaryngology-HNS annual meeting, at the Tides Inn Resort, Irvington, Virginia. Info: Donna Scott, 804-353-2721. — **May 7–8**

Clinical auscultation of the heart, sponsored by the American College of Cardiology, at the Georgetown University Medical Center, Washington, DC. 18 Cat 1 AMA/PRA credits. Info: 800-257-4739. — **May 12–14**

Central Atlantic Seminar in Anesthesiology, sponsored by the George Washington University Medical Center, in Washington, DC. Info: John F. Vargo, 202-994-4285. — **May 13–16**

Maryland Academy of Family Physicians 45th annual meeting and scientific session, at the Princess Royale Oceanfront Hotel and Conference Center, Ocean City, MD. 41.25 Cat 1 AMA/PRA credits; 41.25 AAFP prescribed hours. Fee: $240 members; $275 nonmembers; 135 paramedicals; No charge for residents, medical students, MAFP retired and life members. Info: Francis C. Bruno, M.D., 410-747-1980. — **May 18–23**

6th annual trauma anesthesia and critical care symposium, sponsored by the International Trauma Anesthesia and Critical Care Society (ITACCS) and Multinational Academic Consortium, at the Hyatt Regency, Baltimore, MD. Info: Kimberly C.A. Unitas, 410-328-2399. — **May 2–22**

Causes of the medical malpractice crisis, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **Oct. 7**

Continuously throughout the year

Fluorescein angiography conference, sponsored by the Retina Center, St. Joseph Hospital, Baltimore, MD, first and third Mondays of each month; 8:00–9:00 a.m. Fee: none. Info: R. Classon, 410-337-4500.

PHYSICIAN'S RECOGNITION AWARD

During November 1992, the physicians listed below received the American Medical Association's (AMA's) Physician's Recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

Azam Baig
Bruce Stephen Bloom
Barney McCoy Davis
Kamalinee V. Deshpande
Michael James LaPenta
Maria Ruehsen-De Moraes
Frank Michael Ryan
David Satinsky
Charles Jay Stahl
Mark Gary Wolfman

The Johns Hopkins Medical Institutions

All courses at the Thomas B. Turner Building unless otherwise indicated. For information on continuing medical education activities, contact the Office of Continuing Education, 720 Rutland Ave., Baltimore, MD 21205 (410-955-2959).

Endoscopic sinus surgery. 19 Cat 1 AMA/PRA credits for lab and lectures; 14.5 Cat 1 AMA/PRA credits for lecture only. Fee: $1,250 for laboratory and lectures; $295 for lecture series only. — **Jan. 7–8**

Advanced endoscopic sinus surgery. 9 Cat 1 AMA/PRA credits. Fee: $1,050. — **Jan. 9**

1993 update in the management of age-related macular degeneration. 6.5 Cat 1 AMA/PRA credits for one-day course; 8.5 Cat 1 AMA/PRA credits for two-day course. Fee: $200 physicians; $100 residents, fellows, and allied health professionals; $350 lectures and optional lab course. — **Jan. 22–23**

Americans with disabilities act of 1992 and you. Info: Dr. Jacqueline K. Corn, 410-955-2609 — **Jan. 29–30**

PET and SPECT brain imaging in clinical practice and research. 18 Cat 1 AMA/PRA credits. Fee: $495 physicians; $395 residents, fellows, and allied health professionals. Info: Patty Campbell, 410-955-6046 or Julia Buchanan, 410-955-8582. — **Mar. 10–12**

Spectrum of developmental disabilities XV: PL 94-142; PL 99-457 — Issues of concern. 20 Cat 1 AMA/PRA credits. Fee: $425. — **Mar. 15–17**

Biological response to orthopaedic implants, at the Marriott Inner Harbor Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. Fee: $200 physicians; $125 residents and fellows. — **Mar. 19–20**

Problems in the diagnosis and management of the dysphagic patient: Transatlantic perspectives, at the Stouffer Harborplace Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. Fee: $425 physicians; $245 residents and allied health professionals. — **Mar. 29–30**

Diagnosis and treatment of neoplastic disorders, medical surgical, and radiotherapeutic aspects. 14.5 Cat 1 AMA/PRA credits available. Fee: $275; $300 postmarked after February 1, 1993; $125 physician-in-training. — **Apr. 1–2**

Current concepts in thyroid disease: Update 1993. Cat 1 AMA/PRA credits available. Fee: $150 physicians; $40 residents and fellows. — **Apr. 16**

20th annual pediatric trends. 45 Cat 1 AMA/PRA credits. Fee: $625 physicians; $375 residents and fellows. — **Apr. 19–24**

34th annual postgraduate institute for pathologists in clinical cytopathology. Course A: Home study, March-April 1993. Course B: Lecture series with laboratory studies. 140 Cat 1 AMA/PRA credits. — **Apr. 19–30**

Quality improvement and the hospital library

On Thursday April 8, 1993

The Maryland Association of Health Sciences Librarians (MAHSL) will offer a continuing education course entitled "Continuous Quality Improvement and the Hospital Library."

The course will be conducted by Chris Jones, a member of the Information Management Task Force of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO). Cost is $50 for MAHSL members and $75 for non-MAHSL members. Enrollment is on a first-come, first-served basis.

The course is scheduled to be held at the Medical and Chirurgical Faculty building from 8 am to 5 pm. To join MAHSL or to register for the course, call Myra Binau at Washington County Hospital (410-790-8801). For more information, call Kathy Curry at 410-532-3891.

Clinical care of the patient with HIV infection, at the Stouffer Harborplace Hotel, Baltimore, MD. 13 Cat 1 AMA/PRA credits; 12.75 AAFP credits. Fee: $325 physicians; $165 residents, fellows and allied health professionals. **Apr. 22–23**

Principles and practice of clinical MRI, at the Stouffer Harborplace Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. **Apr. 22–25**

XII international papillomavirus workshop, at the Hyatt Regency Hotel, Baltimore, MD. 30 Cat 1 AMA/PRA credits. Fee: $400 prior to June 30, 1993; $450 after June 30, 1993. Info: Gretchen Shelton, 410-931-8108. **Apr. 22–25**

Pediatric allergy and immunology for the practitioner. Cat 1 AMA/PRA credits available. **May 6–7**

6th summer institute in environmental health studies. Info: Dr. Jacqueline Corn or Linda Lamb, 410-955-2609. **June 7–18**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; thirty topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

Statement of ownership, management, and circulation

Alcohol and trauma care, sponsored by the Maryland Institute for Emergency Medical Services Systems, in Baltimore, MD. Info: Office of International Development, 410-328-2399. **Mar. 11**

R. Adams Cowley 15th national trauma symposium, sponsored by the Maryland Institute for Emergency Medical Services Systems, at the Hyatt Regency Baltimore, in Baltimore, MD. Info: Office of International Development, 410-328-2399. **Mar. 12–14**

Infectious diseases in everyday medicine—3rd annual symposium, at the Baltimore Convention Center, Baltimore, MD. 12.75 Cat 1 AMA/PRA credits. Fee: $175 physicians before 4/1/93, $200 after 4/1/93; $100 allied health professionals before 4/1/93, $125 after 4/1/93; $50 fellows, residents and students before 4/1/93, $75 after 4/1/93. Info: Eunice Katz, 410-706-7560. **Apr. 1–20**

Continuously throughout the year

Visiting professor program. A directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 410-328-3956.

Visiting fellowship in interventional radiology. Five-day practicum for radiologists, including conferences, patient rounds, and laboratory observations. By appointment only. 40 Cat 1 AMA/PRA credit. Fee: $1,200.

Ultrasound: Preceptorships. For physicians or sonographers with six-months' experience in practicing ultrasound. By appointment only. 40 Cat 1 AMA/PRA credit. $500.

Departmental rounds and conferences. Weekly, hands-on, and lecture presentations hosted by the university's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

Pediatric grand rounds. Every Thursday from September to June, except third Thursday, in the R. Adams Cowley Shock Trauma Auditorium. Info: Bonnie Winters, 410-328-6777.

Performing Arts Medicine II: Focus on Young Performers

A conference presented by the Committee on Medicine and the Performing Arts of the Medical and Chirurgical Faculty of Maryland

The second annual conference on performing arts medicine will advance the knowledge of health care professionals, performers, and educators regarding health problems faced by musicians, vocalists, and dancers. The program will emphasize care of student performers. The conference will consist of thirteen presentations and a short recital. The lectures will include audio-visual aids and, in several cases, performer demonstrations.

March 20-21, 1993
Med Chi Faculty Building
1211 Cathedral St.
Baltimore, MD

This conference is designed to educate physicians, both specialists and primary care practitioners, about the health and training problems faced by student performers during their secondary, college, and graduate training. They will learn to recognize problems of artists, some of which are unique to performers or have special occupational consequences. Various means of diagnosis, treatment, and rehabilitation will be presented. Special attention will be given to protecting young performers and preventing disabilities, by working in partnership with teachers and students.

Registration Form

Performing Arts Medicine II: Focus on Young Performers
March 20-21, 1993

Med Chi member physicians $50; nonmember physicians $75; allied health professionals $35; performers, music educators, students, residents $15. Tuition assistance available.

Return registration form and payment to
Susan E. Harman
Music Medicine Clearinghouse
Med Chi, 1211 Cathedral St.
Baltimore, MD 21201-5585

Optional attendance at the Baltimore Symphony Orchestra concert on Sunday, March 21 at 3 p.m. is an additional $15. The program will consist of works by Grieg, Richard Strauss, and Tchaikovsky, conducted by Eri Klas. To purchase BSO tickets, you must register by February 26.

For additional information, contact Susan E. Harman at 410-539-0872 (within the Baltimore metro area) or at 1-800-492-1056 (elsewhere in MD). The fax number is 410-727-5967.

CHLAMYDIA: Diagnosis and Treatment Guidelines

Infection caused by *Chlamydia trachomatis* is the most prevalent sexually transmitted disease in the United States. It is estimated that there are approximately 4 million new cases annually. Annual costs for the disease exceed $2.4 billion.

As laboratory techniques improve, chlamydial organisms are increasingly implicated as causes of human disease. Chlamydiae are obligate intracellular bacteria, which differ from viruses and rickettsiae but, like the latter, have been sensitive to broad-spectrum antimicrobials. Chlamydiae are now recognized as important pathogens responsible for an increasingly apparent number of sexually transmitted infections, with eye and lung infections in infants the consequences of genital infections in their mothers.

CHLAMYDIAL INFECTION IN ADULTS

A. Diagnosis

Sexually transmitted genital infections are manifested in males primarily as a urethritis, and in females by mucopurulent cervicitis. Clinical manifestations of urethritis are usually indistinguishable from gonorrhea and include an opaque discharge of moderate or scanty quantity, urethral itching, and burning on urination. Asymptomatic infection occurs in men; infection may be found in 1-10% of sexually active men. Possible complications or sequelae of male urethral infections include epididymitis, infertility, and Reiter's syndrome. In homosexual men, receptive anorectal intercourse may result in chlamydial proctitis.

In the female, the clinical manifestations may be similar to those of gonorrhea, frequently presenting as a mucopurulent endocervical discharge, with edema, erythema and easily induced endocervical bleeding, caused by inflammation of the endocervical columnar epithelium. However, most women with endocervical or urethral infections are asymptomatic. Complications and sequelae are salpingitis with subsequent risk of infertility or ectopic pregnancy. Asymptomatic, chronic infections of the endometrium and fallopian tubes may lead to the same outcome.

Chlamydial infections may be acquired concurrently with gonorrhea and persist after the gonorrhea has been successfully treated. Because gonococcal and chlamydial cervicitis are often difficult to distinguish clinically, treatment for both organisms is recommended when one is suspected.

Culture and nonculture methods for diagnosis of *C. trachomatis* are now available. Appropriate use of these diagnostic tests is strongly encouraged, especially for screening asymptomatic high-risk women in whom infection would otherwise be undetected. However, in clinical settings where testing for chlamydia is not routine or available, treatment often is prescribed on the basis of clini-

cal diagnosis or as co-treatment for gonorrhea. Priority groups for chlamydia testing, if resources are limited, are high-risk pregnant women, adolescents, and women with multiple sexual partners. Results of chlamydial tests should be interpreted with care. The sensitivity of all currently available laboratory tests for *C. trachomatis* tests is substantially less than 100%; thus, false-negative tests are possible. Although the specificity of nonculture tests has improved substantially, false-positive test results may occur with non culture tests.

Definitive Diagnosis (requires 1 or 2)

1. Isolation and confirmed identification of *C. trachomatis* in tissue culture from cervical, rectal, or urethral exudate and identification of characteristic intracellular inclusions.
2. Identification of *C. trachomatis* by one of the following methods and confirmation by a second culture or nonculture test method:
   a. Identification of the organism by direct immunofluorescence antibody (DFA) test of exudate;
   b. Detection of antigen by enzyme immunoassay (EIA) of exudate; and
   c. Detection of nucleic acid from exudate by the DNA probe technique.

Presumptive Diagnosis (requires 1 and 2)

1. Presence or absence of clinical symptoms (e.g., mucopurulent cervicitis, urethritis, epididymitis, pelvic inflammatory disease).
2. Detection of *C. trachomatis* by a nonculture test.

Suggestive (requires 1, <u>and</u> either 2 or 3)

1. Clinical symptoms (e.g., mucopurulent cervicitis, urethritis, epididymitis, pelvic inflammatory disease).
2. Exclusion of other causes of discharge or exudate (e.g., gonorrhea).
3. Sexual exposure to a person infected with *C. trachomatis* or recently diagnosed with nongonococcal urethritis, mucopurulent cervicitis, or pelvic inflammatory disease.

B. Treatment and Follow-up

The CDC recommended treatment regimen for uncomplicated urethral, endocervical, or rectal *C. trachomatis* infections in men and non-pregnant women is:

Doxycycline 100 mg. orally 2 times a day for 7 days; or

Tetracycline 500 mg. orally 4 times a day for 7 days.

In addition, preliminary studies have shown that a one (1) gram dose of azithromycin is effective in the treatment of genital chlamydial infections in persons 16 years of age or over. It is FDA approved for this use. (The cost of a single dose of azithromycin is approximately twice that of other recommended therapies.)

The recommended treatment regimen in **pregnancy** is:

Erythromycin base 500 mg. orally 4 times a day for 7 days

Note: Azithromycin should <u>not</u> *be utilized in pregnant women.*

CDC recommends that all patients treated for gonorrhea be simultaneously treated for chlamydia. (See reference 2 for gonorrhea recommendations.)

C. Counseling/Education (See Chlamydia Fact Sheet for use inpatient education)

Patients should:

1. Understand how to take prescribed oral medications (e.g., with doxycycline prolonged sunlight should be avoided; tetracycline should be taken 1 hour before or 2 hours after meals, dairy products, antacids, iron or other mineral-containing preparations);
2. Return for evaluation if symptoms persist or recur after treatment;
3. Refer sex partner(s) for examination and treatment;
4. Avoid sex until patient and partner(s) have completed therapy and,
5. Use condoms to prevent future infections.

D. Evaluation of Sex Partners

All sex partners of patients who have *C. trachomatis* infection should be examined and promptly treated, even if asymptomatic, with an appropriate regimen for *C. trachomatis* if any sexual exposure took place within the time period 30 days before the onset of symptoms until the treatment date of the infected patient, or 60 days preceding the diagnosis for asymptomatic cases.

E. Special Considerations

Screening: The prevalence of chlamydia is very high among sexually active young women but may also be high among young men. Screening is recommended for all women under 20 years of age who are sexually active, and for all women over 20 years of age with at least two of the following: age 20-24, inconsistent or no use of barrier contraceptives, and either a new sex partner or more than one partner in the past 3 months. Culture or nonculture tests may be used for screening women. Screening is desirable for sexually active men, however, culture is the desirable test since nonculture tests are insensitive in asymptomatic males. The leukocyte esterase test performed on urine specimens as a screening tool for urethritis and the polymerase chain reaction (PCR) for *C. trachomatis* DNA on urogenital specimens are currently under evaluation.

Nonculture tests: Nonculture tests for *C. trachomatis* should not be used if the results have medicolegal (e.g., suspected child abuse) or serious consequences because of the possibility of false-positive results.

Testing for other STDs: All patients with chlamydial infection should have a serologic test for syphilis and should be offered confidential counseling and testing for HIV infection. Patients with chlamydial infection who also have syphilis or who are sex partners of persons in whom syphilis has been diagnosed should be promptly treated with a regimen appropriate to the stage of syphilis. (See reference 2 for syphilis recommendations.)

Infection in pregnancy: Pregnant women should undergo diagnostic testing for chlamydia, gonorrhea, syphilis, hepatitis B virus infection, and be offered HIV counseling and testing at their first prenatal visit. Women at high risk for STDs should also be retested during the third trimester. Chlamydia tests are recommended during the third trimester since complications are associated with the perinatal and puerperal period. Culture or nonculture chlamydia tests may be used to screen pregnant women for infection. Certain antimicrobials are contraindicated in pregnancy because of the possible adverse effects on the fetus.

CHLAMYDIAL INFECTION IN INFANTS

As many as 70% of infants born to women infected with *C. trachomatis* become infected. Many of these infants develop conjunctivitis or pneumonia, but nasopharyngeal colonization with *C. trachomatis* is common whether or not these diseases occur.

All cases of ophthalmia neonatorum should be tested for the presence of *Neisseria gonorrhoeae* and *C. trachomatis.* The diagnosis of chlamydia conjunctivitis can be established by culture or nonculture tests of conjunctival scrapings. In infants, pneumonia caused by *C. trachomatis* occurs 4 to 6 weeks after birth and is characterized by a subacute course, cough, and relative lack of fever. Systemic therapy for both conjunctivitis and pneumonia should be administered because of the nasopharyngeal colonization that commonly occurs. Treatment of chlamydial infections in pregnant women is the best method for preventing neonatal chlamydial disease.

Chlamydia Fact Sheet

Chlamydia is an infection caused by a bacterium

Chlamydia trachomatis is the bacterium (germ) that causes chlamydia.

Chlamydia is spread by sexual contact and from mother to baby

The bacterium is found in infected body fluids from the penis or vagina and spread by direct sexual contact (touching or rubbing). Babies can develop eye and ear infections as well as pneumonia. Sometimes this infection becomes so serious in babies that they may die.

Symptoms to look for:

- Discharge from the penis, vagina or rectum
- Bad cramping or severe pain in the pelvic area (pelvic inflammatory disease or PID)
- Burning or itching around the opening of the penis
- Pain in the testicles
- Pain when urinating

The first symptoms may start 7 to 30 days after contact with an infected person. Many men and women can have chlamydia and spread it without having any symptoms at all. If the infection is not treated, chlamydia can damage reproductive organs, sometimes causing sterility.

Chlamydia can be treated with antibiotics

Since the symptoms of chlamydia and gonorrhea are similar and both diseases can occur at the same time, everyone treated for gonorrhea should also be treated for chlamydia.

Chlamydia is preventable

- Avoid infection by being monogamous, that is, only have sex with one person who only has sex with you
- Avoid unprotected sex -- use condoms
- Know the signs of chlamydia infection

If you think you or your partner(s) has chlamydia or any other STD, see your doctor and don't have sex

If you have chlamydia, tell your partners so that they can be treated

Don't have sex until both you and your partner have finished treatment.

We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1993 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, and see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.

Doctor of the Day 1993

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 5:00 p.m. For more information, call Joyce Yensen at Med Chi's Legal Department, 410-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

AMA advocates unity in health system reform

In his keynote address at the American Medical Association's Interim Meeting, AMA President John Lee Clowe, MD noted that elements of the AMA's Health Access America plan appeared in platforms of both political parties during the November election. These elements are expected to be incorporated into most of the legislation likely to come before the 103rd Congress. The AMA wants to enhance physician involvement in public and private regulation of medical care, encourage implementation of market-oriented reforms, and prevent adverse patient care that would result from price controls or stringent global budgets.

Most of the major players in the health system reform debate "realize that they can't achieve reform without the participation of the medical profession. Medicine must speak with one voice in the health system reform debate. Most look to the AMA as the voice of organized medicine in this process of change," he said.

AMA urges safeguards for patients' computer records

AMA testimony before the federal Task Force on Privacy of Private Sector Health Records pressed for more complex security for computerized patient records to protect privacy and to avoid legal problems. The AMA emphasized that patient records must remain confidential, accurate, comprehensible, and free from unauthorized access. The AMA recommends that physicians and other health care providers be expected to use reasonable safeguards, since there is no fail-safe protection.

New AMA guidelines focus on elder abuse

The AMA has issued its first guidelines on elder abuse, urging physicians and other health care professionals to be more alert to signs of neglect or mistreatment of older patients by families or other care givers. An estimated two million U.S. elderly are mistreated each year. "A physician may be the only person outside the family who sees the older adult regularly," said AMA Board of Trustee, Palma E. Formica, MD.

The AMA guidelines recommend physicians incorporate standard questions to screen for mistreatment into routine care.

- Be aware that abuse may be physical, psychological, financial or material, or any combination of these.
- Be aware that in institutions, elder abuse may be perpetrated by a staff member, another patient, an intruder or a visitor.
- Many states require physicians to report suspected elder abuse to designated state agency.
- Your duty to report suspected abuse supersedes doctor- patient confidentiality issues, most experts say.

Materials included are excerpted from *Member Matters*, a monthly publication sent to all members of the American Medical Association.

AMA health reform strategies for 1993

With the election of President-elect Clinton and the new Congress, the American Medical Association and the federation will have both opportunities and challenges regarding health policy. Many aspects of Clinton's proposals for health system reform are consistent with the AMA's own Health Access America. AMA leaders have already held discussions with Clinton's health transition team. The AMA wants to enhance physician involvement in public and private regulation of medical care, encourage implementation of market-oriented reforms, and prevent adverse patient care that would result from price controls or stringent global budgets.

Health Access America. In any reform plan, the AMA will continue to advocate key principles contained in Health Access America. The AMA will be a very aggressive advocate for patients and their physicians.

Federation Unity. Nearly all state medical associations have endorsed Health Access America while some national specialty societies have developed their own health care reform proposals. The AMA will emphasize our similarities to allow intensified coalition-building during the next critical months. Unity on key health reform principles will provide us with strategic leverage with the Administration and Congress.

Managed Competition. President-elect Clinton appears to favor managed competition where insurers, hospitals, and physicians would be encouraged to develop local "health networks." The AMA will:

- develop policy specifications to make sure the AMA remains at the forefront of the managed competition debate.
- lobby to include acceptable provisions and modify objectionable proposals.
- help physician members respond to managed competition.

Negotiations. The AMA will continue to seek relief from the antitrust laws to allow physician negotiation with both the federal government and private sector, and to pursue self- regulation.

Thanks to our long-term advocacy of health system reform, the AMA and the federation are well-positioned and well-equipped to be key players in the forth-coming debate.

Materials included are excerpted from *Member Matters*, a monthly publication sent to all members of the American Medical Association.

COMING OUT OF THE DARK

Med Chi's Physician Rehabilitation Committee deals with the substance abuse and mental health problems of Maryland physicians, with a confidential and nondisciplinary focus...Addiction, Marital/Family Conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap...If these problems exist, we can help find the solution. Call us.

The Physician Rehabilitation Committee of Med Chi is available to all Maryland physicians, and their families. The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL. If you, a colleague, or family member is in need of our services call (410)962-5580 or call toll free (800)992-7010, or leave a message 24 hours a day, 7 days a week at (410)727-1020.

HELPING IS OUR BUSINESS...All donations to the Physician Rehabilitation Committee are used for the delivery of services to Maryland physicians in need of help. If you wish to help further the work of the Committee through a tax deductible donation send your check to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1204 Maryland Avenue, Baltimore, Maryland 21201 Please note on your donation: "Physician Rehab"

INTERNAL MEDICINE

Internist needs Board Certified Physician in Internal Medicine who is interested in expanding his practice with the possibility of a merger. Catonsville area. Should have a special interest in Geriatric Medicine. Respond to: Mrs. C. Beal, 410-744-4044.

PHYSICIAN WANTED

Retired or semi-retired—OK for centrally located Baltimore offices. Call 410-547-2676.

FAMILY PRACTITIONER

An excellent position is available for a BC/BE family practice physician in a new community health center in Sioux City, Iowa. A full range of family practice medicine is needed in a community that is very supportive of the center. Sioux City is a great place to raise a family and has excellent public and parochial school systems, a community college, two liberal arts colleges, a graduate center, two excellent medical centers, a Residency Training Program (Family Practice), etc. The center offers a competitive compensation and benefit package, paid malpractice, etc. For more information, write Jeff Hackett, Executive Director, Siouxland Community Health Center, 1709 Pierce St., Sioux City, IA 51105 or call 712-252-2477.

BC/BE PEDIATRICIAN

Pediatric group in the Maryland-Washington D.C. area seeks BC/BE pediatrician to work in an academic atmosphere close to four medical schools and teaching hospitals. Excellent benefit package. Please reply to: B. Glober, 12700 North Point Lane, Laurel, MD 20708.

INTERNAL MEDICINE

BC/BE to join 2 internists in the Baltimore-Washington D.C. area. Competitive salary, excellent benefits. Send C.V. to C.E. Sheehan, M.D. 10293/B Baltimore National Pike, Ellicott City, MD 21042 or FAX 410-313-8463, Phone 410-465-1090.

RESEARCH ASSOCIATE

Position available July 1, 1993. Applicants must hold a Ph.D., M.D. or equivalent. Interest in atherosclerosis research a must. Experience in tissue culture, molecular biology, immunohistochemistry, and electron microscopy. Duties include: (1) perform tissue collection and prep for experiments; (2) Data collection and interpretation; (3) molecular biology experiments; (4) preparation of grant proposals; (5) development of computer programs for morphometry. Send CV to: Wolfgang Mergner, M.D., Ph.D., Department of Pathology, University of Maryland, 22 S. Greene Street, Baltimore, MD 21201. EOE

MMJ

Classified Advertising

Effective with the 1993 April issue prepayment is required for all classified advertising.

- Cost for Med Chi members is $5.00 per 35 characters or portion thereof (each letter, number, symbol, punctuation mark, or space counts as one character).
- Cost for nonmembers is $8.00 per 35 characters or portion thereof with a minimum cost of $50.00 per advertisement.
- Advertisements placed for the benefit of an HMO or a hospital are charged the nonmember rate.
- Advertisements for services (e.g., collection agencies) or for items not related to the practice of medicine (e.g., real estate sales) are limited to a maximum of three placements per calendar year.
- Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physician's practice or equipment.
- Box numbers are provided free of charge.
- Advertising copy and payment (checks should be made out to *Maryland Medical Journal*) should be sent seven weeks prior to the first of the month in which the advertisement is to appear.

Box replies and advertising copy should be sent to
Lori Robinson
MMJ
1211 Cathedral St., Baltimore, MD 21201-5585.

For more information, call Lori Robinson at 410-539-0872 or 1-800-492-1056.

INTERNIST/FAMILY PRACTITIONER

Board Certified/Board Eligible, full or part-time for HMO facility in Timonium area. Challenging environment with excellent salary and benefits. Send CV to Dianne at Westminster Medical Center, 1130 Baltimore Blvd., Westminster, MD 21157.

EMERGENCY MEDICINE

Practice EM with young, progressive group in suburban community hospital between Baltimore and Annapolis. 45K pts, triple coverage, excellent compensation. Commitment to wellbeing. EM, FP only. Call Dr. Davis, 410-544-9185.

PHYSICIANS WANTED

Group practice affiliated with the largest HMO in Maryland seeks career-minded Board Certified physicians in Internal Medicine and Family Practice to provide quality patient care. This is a staff position that allows you to enjoy life without the hassles of billing and overhead. Positions available in the Baltimore and surrounding metropolitan areas. Reply with CV to Jo Phillips, Medical Staff Coordinator, Potomac Physicians, P.A., P.O. Box 13126, Baltimore, MD 21203-3126 or call 410-528-7800 for information on these opportunities.

INTERNIST/FAMILY PRACTITIONER

Board Certified/Board Eligible, full-time for HMO facility in Catonsville area. Challenging environment with excellent salary and benefits. Send CV to Dianne at Westminster Medical Center, 1130 Baltimore Blvd., Westminster, MD 21157.

PEDIATRICIAN

Pediatric group in Howard County needs BE/BC pediatrician to work 2/3's to full-time starting July 1993 or sooner. On call every seventh night. Competitive salary and benefits. Call Kenneth Klebanow, M.D. 410-997-1700.

ORTHOPAEDIC SURGEON

BC/BE to join 4 orthopaedists in a large multispecialty group. Interest and expertise in spine surgery a plus. Extensive support system and modern facility located in Columbia, near the cultural advantages and medical schools of the Baltimore-Washington, DC area. Competitive salary, excellent benefits. Please direct CVs to: Patuxent Medical Group, Inc.; 2 Knoll North Drive; Columbia, MD 21045; Attn: Physician Recruiter. EOE M/F/H/V.

PHYSICIANS WANTED

Semi-retired or retired physicians for pleasant office practice part-time. Call 547-2686.

PSYCHIATRIST

Part-time position available for board certified/eligible psychiatrist in a multispecialty group practice in the Balto. metro area. Psychiatrist will offer a full range of mental health services. Candidate will be able to work and gain expertise in managed care. Position could develop into full time. May have utilization review opportunities. Please send vita to: Gregory Barrow, M.D., 3701 Old Court Rd. #16, Baltimore, MD 21208.

OFFICE SPACE FOR SUBLEASE

Medical office space for sublease in booming Crofton area; fastest growing section of Anne Arundel County. Fully equipped luxurious suite suitable for a wide range of subspecialties. Flexible hours of availability. Call 410-721-6500.

OFFICE TO SUBLET

In the O'Dea Medical Arts Building at St. Joseph Hospital. Call 410-321-1514.

PIMLICO OFFICE TO SHARE

Physical Therapy practice wishes to share approx. 2,100 sq. ft. office space with physician part-time. Call 410-578-8989.

OFFICE FOR RENT

Burkland Medical Center office for rent in North Silver Spring, MD. Only 1 and 1/2 days per week still available. 1,400 sq. ft. Fully furnished 4 exam rooms, lg waiting rm, pvt. lavatory, consult. office, free parking, all utilities. Plus many extras included. Call 301-983-8845.

SUBLEASE

Office for sublease. Northern Anne Arundel County. Fully furnished. Reply to Box 12.

MEDICAL OFFICE BUILDING

Full service medical office building has vacancy. Seeks orthopedic and primary care group. Walking distance to St. Agnes Hospital. Pharmacy, clinical laboratory, optician, and x-ray facilities on site. Will negotiate with proper tenant. Collegial atmosphere. Call 410-646-5538, 9:00 a.m. to 4:00 p.m.

SHARE OFFICE REISTERSTOWN

Ideal for dermatologist, physiatrist, neurologist, psychiatrist. Use of consultation room and examining rooms. Share expenses and personnel. Call 410-833-6466. M-F.

MEDICAL OFFICES FOR RENT

Towson. Full-time or part-time. The Professional Centre, next to St. Joseph's Hospital. Free parking. Phone 410-337-6800.

MEDICAL EQUIPMENT

2 CBSI computer systems and 6.0 printer. Can be upgraded to 7.0 if needed (new $45,000). Sale $12,500. Universal x-ray machine with film processor, Maico portable audiometer, Storz instruments; variety of forceps, scissors, etc. Mayo stand and more. Call 301-983-8845.

MEDICAL/ORTHOPAEDIC/ X-RAY OFFICE

Medical office with x-ray equipment for sale. Suitable for medical, orthopaedic or radiology practice in the Bel Air area. Reply to Box 11.

LAB EQUIPMENT

CBC, Electrolytes, and Chemistry Profiler. Also performs Lipid Profiles with HDL and Theophylline levels. Fully automated. Easily fits into regular office routines. Med Tech not necessary for operation. 5 profiles per day will pay for equipment in 6 months. Installation included. Present owner joining group with its own lab. Call Richard Diamond, M.D. if interested, 235-0999. ■

Enter the Thirteenth Annual Med Chi Photo Contest

David Paul, MD – 1st Place Color, 1991 – "Wars End"

THIRTEEN MAY BE YOUR LUCKY NUMBER

Deadline for entries is Friday, March 19, 1993 ♦ Two categories: black & white or color
Open to all Med Chi and Auxiliary members ♦ First and second prizes awarded in each category

All photographs will be displayed at the 1993 Annual Meeting at the University of Maryland Adult Education Center, College Park.

Photo Contest Rules:

Eligibility: All members of Med Chi and members of the Auxiliary may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

1. Photographs may be submitted in two categories: black and white or color.
2. Limit: three entries per person.
3. Prints only, no smaller than 8 x 10" or larger than 11 x 14" will be accepted. If your favorite shot is a slide, you must have a print made within these size ranges to enter the contest.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to Med Chi, 1211 Cathedral Street, Baltimore, MD 21201 by the close of the business day on March 19.
7. Photographs entered in the contest will be on display at the 1993 Annual Meeting.
8. Prizes will be awarded to the first and second place winners.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 29–May 1, 1993.
10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting at noon on May 1, or at Med Chi thereafter.
11. Med Chi does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

When you choose Princeton, you're in good company

"The Surgicenter was a new entity, and most insurers didn't know how to handle it. One wouldn't cover this procedure, the other wanted to exclude that one.

Princeton reviewed how we performed these procedures and then provided coverage for everything. They were flexible and willing to work with us so that we got the coverage we needed."

Dr. Lawrence Pinkner
Plastic surgeon
President, Surgicenter of Baltimore

Since 1982, Princeton has been designing insurance policies to meet the needs of medical professionals.

Rated "A" by Standard & Poor's

Princeton Insurance Company
4 North Park Drive
Hunt Valley, MD 21030-1812
410-785-0900

More than 1,500 doctors in Maryland and Delaware have chosen Princeton for their professional liability coverage. It's easy to switch.

Why wait?

Effective cholesterol control

Consistently and significantly reduces total C and atherogenic LDL-C; positively affects other key lipids

*Each arrow represents a range of means derived from a single placebo-controlled study that included 55 patients treated with pravastatin.

PRAVACHOL® (pravastatin sodium) is indicated as an adjunct to diet for the reduction of elevated total and LDL-cholesterol levels in patients with primary hypercholesterolemia (Types IIa and IIb) when the response to diet alone has not been adequate.

Active liver disease *or* unexplained transaminase elevations, pregnancy and lactation are contraindications to the use of pravastatin.

Reference: 1. Jones PH, et al. Once-daily pravastatin in patients with primary hypercholesterolemia: a dose-response study. *Clin Cardiol.* 1991;14:146-151

PRAVACHOL™ pravastatin sodium 20 mg tablets

Please see CONTRAINDICATIONS, WARNINGS, PRECAUTIONS, and ADVERSE REACTIONS in the brief summary of prescribing information on the adjacent page.

Bristol-Myers Squibb Company

PRAVACHOL® (Pravastatin Sodium Tablets)

CONTRAINDICATIONS

Hypersensitivity to any component of this medication.

Active liver disease or unexplained, persistent elevations in liver function tests (see WARNINGS).

Pregnancy and lactation. Atherosclerosis is a chronic process and discontinuation of lipid-lowering drugs during pregnancy should have little impact on the outcome of long-term therapy of primary hypercholesterolemia. Cholesterol and other products of cholesterol biosynthesis are essential components for fetal development (including synthesis of steroids and cell membranes). Since HMG-CoA reductase inhibitors decrease cholesterol synthesis and possibly the synthesis of other biologically active substances derived from cholesterol, they may cause fetal harm when administered to pregnant women. Therefore, HMG-CoA reductase inhibitors are contraindicated during pregnancy and in nursing mothers. **Pravastatin should be administered to women of childbearing age only when such patients are highly unlikely to conceive and have been informed of the potential hazards.** If the patient becomes pregnant while taking this class of drug, therapy should be discontinued and the patient apprised of the potential hazard to the fetus.

WARNINGS

Liver Enzymes: HMG-CoA reductase inhibitors, like some other lipid-lowering therapies, have been associated with biochemical abnormalities of liver function. Increases of serum transaminase (ALT, AST) values to more than 3 times the upper limit of normal occurring on 2 or more (not necessarily sequential) occasions have been reported in 1.3% of patients treated with pravastatin in the U.S. over an average period of 18 months. These abnormalities were not associated with cholestasis and did not appear to be related to treatment duration. In those patients in whom these abnormalities were believed to be related to pravastatin and who were discontinued from therapy, the transaminase levels usually fell slowly to pretreatment levels. These biochemical findings are usually asymptomatic although worldwide experience indicates that anorexia, weakness, and/or abdominal pain may also be present in rare patients.

As with other lipid-lowering agents, liver function tests should be performed during therapy with pravastatin. Serum aminotransferases, including ALT (SGPT), should be monitored before treatment begins, every six weeks for the first three months, every eight weeks during the remainder of the first year, and periodically thereafter (e.g., at about six-month intervals). Special attention should be given to patients who develop increased transaminase levels. Liver function tests should be repeated to confirm an elevation and subsequently monitored at more frequent intervals. If increases in AST and ALT equal or exceed three times the upper limit of normal and persist, then therapy should be discontinued. Persistence of significant aminotransferase elevations following discontinuation of therapy may warrant consideration of liver biopsy.

Active liver disease or unexplained transaminase elevations are contraindications to the use of pravastatin (see CONTRAINDICATIONS). Caution should be exercised when pravastatin is administered to patients with a history of liver disease or heavy alcohol ingestion (see CLINICAL PHARMACOLOGY: Pharmacokinetics/Metabolism). Such patients should be closely monitored, started at the lower end of the recommended dosing range, and titrated to the desired therapeutic effect.

Skeletal Muscle: Rhabdomyolysis with renal dysfunction secondary to myoglobinuria has been reported with pravastatin and other drugs in this class. Uncomplicated myalgia has also been reported in pravastatin-treated patients (see ADVERSE REACTIONS). Myopathy, defined as muscle aching or muscle weakness in conjunction with increases in creatine phosphokinase (CPK) values to greater than 10 times the upper limit of normal was reported to be possibly due to pravastatin in only one patient in clinical trials (<0.1%). Myopathy should be considered in any patient with diffuse myalgias, muscle tenderness or weakness, and/or marked elevation of CPK. Patients should be advised to report promptly unexplained muscle pain, tenderness or weakness, particularly if accompanied by malaise or fever. **Pravastatin therapy should be discontinued if markedly elevated CPK levels occur or myopathy is diagnosed or suspected. Pravastatin therapy should also be temporarily withheld in any patient experiencing an acute or serious condition predisposing to the development of renal failure secondary to rhabdomyolysis, e.g., sepsis; hypotension; major surgery; trauma; severe metabolic, endocrine, or electrolyte disorders; or uncontrolled epilepsy.**

The risk of myopathy during treatment with lovastatin is increased if therapy with either cyclosporine, gemfibrozil, erythromycin, or niacin is administered concurrently. There is no experience with the use of pravastatin together with cyclosporine. Myopathy has not been observed in clinical trials involving small numbers of patients who were treated with pravastatin together with niacin. One trial of limited size involving combined therapy with pravastatin and gemfibrozil showed a trend toward more frequent CPK elevations and patient withdrawals due to musculoskeletal symptoms in the group receiving combined treatment as compared with the groups receiving placebo, gemfibrozil, or pravastatin monotherapy. Myopathy was not reported in this trial (see PRECAUTIONS: Drug Interactions). One patient developed myopathy when clofibrate was added to a previously well tolerated regimen of pravastatin; the myopathy resolved when clofibrate therapy was stopped and pravastatin treatment continued. **The use of fibrates alone may occasionally be associated with myopathy. The combined use of pravastatin and fibrates should generally be avoided.**

PRECAUTIONS

General: Pravastatin may elevate creatine phosphokinase and transaminase levels (see ADVERSE REACTIONS). This should be considered in the differential diagnosis of chest pain in a patient on therapy with pravastatin.

Homozygous Familial Hypercholesterolemia. Pravastatin has not been evaluated in patients with rare homozygous familial hypercholesterolemia. In this group of patients, it has been reported that HMG-CoA reductase inhibitors are less effective because the patients lack functional LDL receptors.

Renal Insufficiency. A single 20 mg oral dose of pravastatin was administered to 24 patients with varying degrees of renal impairment (as determined by creatinine clearance). No effect was observed on the pharmacokinetics of pravastatin or its 3α-hydroxy isomeric metabolite (SQ 31,906). A small increase was seen in mean AUC values and half-life ($t_{1/2}$) for the inactive enzymatic ring hydroxylation metabolite (SQ 31,945). Given this small sample size, the dosage administered, and the degree of individual variability, patients with renal impairment who are receiving pravastatin should be closely monitored.

Information for Patients: Patients should be advised to report promptly unexplained muscle pain, tenderness or weakness, particularly if accompanied by malaise or fever.

Drug Interactions: *Immunosuppressive Drugs, Gemfibrozil, Niacin (Nicotinic Acid), Erythromycin:* See WARNINGS: Skeletal Muscle.

Antipyrine: Clearance by the cytochrome P450 system was unaltered by concomitant administration of pravastatin. Since pravastatin does not appear to induce hepatic drug-metabolizing enzymes, it is not expected that any significant interaction of pravastatin with other drugs (e.g., phenytoin, quinidine) metabolized by the cytochrome P450 system will occur.

Cholestyramine/Colestipol: Concomitant administration resulted in an approximately 40 to 50% decrease in the mean AUC of pravastatin. However, when pravastatin was administered 1 hour before or 4 hours after cholestyramine or 1 hour before colestipol and a standard meal, there was no clinically significant decrease in bioavailability or therapeutic effect. (See DOSAGE AND ADMINISTRATION: Concomitant Therapy.)

Warfarin: In a study involving 10 healthy male subjects given pravastatin and warfarin concomitantly for 6 days, bioavailability parameters at steady state for pravastatin (parent compound) were not altered. Pravastatin did not alter the plasma protein-binding of warfarin. Concomitant dosing did increase the AUC and Cmax of warfarin but did not produce any changes in its anticoagulant action (i.e., no increase was seen in mean prothrombin time after 6 days of concomitant therapy). However, bleeding and extreme prolongation of prothrombin time has been reported with another drug in this class. Patients receiving warfarin-type anticoagulants should have their prothrombin times closely monitored when pravastatin is initiated or the dosage of pravastatin is changed.

Cimetidine: The $AUC_{0\text{-}12hr}$ for pravastatin when given with cimetidine was not significantly different from the AUC for pravastatin when given alone. A significant difference was observed between the AUC's for pravastatin when given with cimetidine compared to when administered with antacid.

Digoxin: In a crossover trial involving 18 healthy male subjects given pravastatin and digoxin concurrently for 9 days, the bioavailability parameters of digoxin were not affected. The AUC of pravastatin tended to increase, but the overall bioavailability of pravastatin plus its metabolites SQ 31,906 and SQ 31,945 was not altered.

Gemfibrozil: In a crossover study in 20 healthy male volunteers given concomitant single doses of pravastatin and gemfibrozil, there was a significant decrease in urinary excretion and protein binding of pravastatin. In addition, there was a significant increase in AUC, Cmax, and Tmax for the pravastatin metabolite SQ 31,906. Combination therapy with pravastatin and gemfibrozil is generally not recommended.

In interaction studies with *aspirin, antacids* (1 hour prior to PRAVACHOL), *cimetidine, nicotinic acid,* or *probucol,* no statistically significant differences in bioavailability were seen when PRAVACHOL (pravastatin sodium) was administered.

Other Drugs: During clinical trials, no noticeable drug interactions were reported when PRAVACHOL was added to: diuretics, antihypertensives, digitalis, converting-enzyme inhibitors, calcium channel blockers, beta-blockers, or nitroglycerin.

Endocrine Function: HMG-CoA reductase inhibitors interfere with cholesterol synthesis and lower circulating cholesterol levels and, as such, might theoretically blunt adrenal or gonadal steroid hormone production. Results of clinical trials with pravastatin in males and post-menopausal females were inconsistent with regard to possible effects of the drug on basal steroid hormone levels. In a study of 21 males, the mean testosterone response to human chorionic gonadotropin was significantly reduced ($p<0.004$) after 16 weeks of treatment with 40 mg of pravastatin. However, the percentage of patients showing a ≥50% rise in plasma testosterone after human chorionic gonadotropin stimulation did not change significantly after therapy in these patients. The effects of HMG-CoA reductase inhibitors on spermatogenesis and fertility have not been studied in adequate numbers of patients. The effects, if any, of pravastatin on the pituitary-gonadal axis in pre-menopausal females are unknown. Patients treated with pravastatin who display clinical evidence of endocrine dysfunction should be evaluated appropriately. Caution should also be exercised if an HMG-CoA reductase inhibitor or other agent used to lower cholesterol levels is administered to patients also receiving other drugs (e.g., ketoconazole, spironolactone, cimetidine) that may diminish the levels or activity of steroid hormones.

CNS Toxicity: CNS vascular lesions, characterized by perivascular hemorrhage and edema and mononuclear cell infiltration of perivascular spaces, were seen in dogs treated with pravastatin at a dose of 25 mg/kg/day, a dose that produced a plasma drug level about 50 times higher than the mean drug level in humans taking 40 mg/day. Similar CNS vascular lesions have been observed with several other drugs in this class.

A chemically similar drug in this class produced optic nerve degeneration (Wallerian degeneration of retinogeniculate fibers) in clinically normal dogs in a dose-dependent fashion starting at 60 mg/kg/day, a dose that produced mean plasma drug levels about 30 times higher than the mean drug level in humans taking the highest recommended dose (as measured by total enzyme inhibitory activity). This same drug also produced vestibulocochlear Wallerian-like degeneration and retinal ganglion cell chromatolysis in dogs treated for 14 weeks at 180 mg/kg/day, a dose which resulted in a mean plasma drug level similar to that seen with the 60 mg/kg dose.

Carcinogenesis, Mutagenesis, Impairment of Fertility: In a 2-year study in rats fed pravastatin at doses of 10, 30, or 100 mg/kg body weight, there was an increased incidence of hepatocellular carcinomas in males at the highest dose ($p<0.01$). Although rats were given up to 125 times the human dose (HD) on a mg/kg body weight basis, their serum drug levels were only 6 to 10 times higher than those measured in humans given 40 mg pravastatin as measured by AUC.

The oral administration of 10, 30, or 100 mg/kg (producing plasma drug levels approximately 0.5 to 5.0 times human drug levels at 40 mg) of pravastatin to mice for 22 months resulted in a statistically significant increase in the incidence of malignant lymphomas in treated females when all treatment groups were pooled and compared to controls ($p<0.05$). The incidence was not dose-related and male mice were not affected.

A chemically similar drug in this class was administered to mice for 72 weeks at 25, 100, and 400 mg/kg body weight, which resulted in mean serum drug levels approximately 3, 15, and 33 times higher than the mean human serum drug concentration (as total inhibitory activity) after a 40 mg oral dose. Liver carcinomas were significantly increased in high-dose females and mid- and high-dose males, with a maximum incidence of 90 percent in males. The incidence of adenomas of the liver was significantly increased in mid- and high-dose females. Drug treatment also significantly increased the incidence of lung adenomas in mid- and high-dose males and females. Adenomas of the eye Harderian gland (a gland of the eye of rodents) were significantly higher in high-dose mice than in controls.

No evidence of mutagenicity was observed *in vitro*, with or without rat-liver metabolic activation, in the following studies: microbial mutagen tests, using mutant strains of *Salmonella typhimurium* or *Escherichia coli;* a forward mutation assay in L5178Y TK +/− mouse lymphoma cells; a chromosomal aberration test in hamster cells; and a gene conversion assay using *Saccharomyces cerevisiae*. In addition, there was no evidence of mutagenicity in either a dominant lethal test in mice or a micronucleus test in mice.

In a study in rats, with daily doses up to 500 mg/kg, pravastatin did not produce any adverse effects on fertility or general reproductive performance. However, in a study with another HMG-CoA reductase inhibitor, there was decreased fertility in male rats treated for 34 weeks at 25 mg/kg body weight, although this effect was not observed in a subsequent fertility study when this same dose was administered for 11 weeks (the entire cycle of spermatogenesis, including epididymal maturation). In rats treated with this same reductase inhibitor at 180 mg/kg/day, seminiferous tubule degeneration (necrosis and loss of spermatogenic epithelium) was observed. Although not seen with pravastatin, two similar drugs in this class caused drug-related testicular atrophy, decreased spermatogenesis, spermatocytic degeneration, and giant cell formation in dogs. The clinical significance of these findings is unclear.

Pregnancy: Pregnancy Category X: See CONTRAINDICATIONS.

Safety in pregnant women has not been established. Pravastatin was not teratogenic in rats at doses up to 1000 mg/kg daily or in rabbits at doses of up to 50 mg/kg daily. These doses resulted in 20x (rabbit) or 240x (rat) the human exposure based on surface area ($mg/meter^2$). However, in studies with another HMG-CoA reductase inhibitor, skeletal malformations were observed in rats and mice. PRAVACHOL (pravastatin sodium) should be administered to women of child-bearing potential only when such patients are highly unlikely to conceive and have been informed of the potential hazards. If the woman becomes pregnant while taking PRAVACHOL (pravastatin sodium), it should be discontinued and the patient advised again as to the potential hazards to the fetus.

Nursing Mothers: A small amount of pravastatin is excreted in human breast milk. Because of the potential for serious adverse reactions in nursing infants, women taking PRAVACHOL should not nurse (see CONTRAINDICATIONS).

Pediatric Use: Safety and effectiveness in individuals less than 18 years old have not been established. Hence, treatment in patients less than 18 years old is not recommended at this time. (See also PRECAUTIONS: **General**.)

ADVERSE REACTIONS

Pravastatin is generally well tolerated; adverse reactions have usually been mild and transient. In 4-month long placebo-controlled trials, 1.7% of pravastatin-treated patients and 1.2% of placebo-treated patients were discontinued from treatment because of adverse experiences attributed to study drug therapy; this difference was not statistically significant. In long-term studies, the most common reasons for discontinuation were asymptomatic serum transaminase increases and mild, non-specific gastrointestinal complaints. During clinical trials the overall incidence of adverse events in the elderly was not different from the incidence observed in younger patients.

Adverse Clinical Events: All adverse clinical events (regardless of attribution) reported in more than 2% of pravastatin-treated patients in the placebo-controlled trials are identified in the table below; also shown are the percentages of patients in whom these medical events were believed to be related or possibly related to the drug:

	All Events %		Events Attributed to Study Drug %	
Body System/Event	Pravastatin (N = 900)	Placebo (N = 411)	Pravastatin (N = 900)	Placebo (N = 411)
Cardiovascular				
Cardiac Chest Pain	4.0	3.4	0.1	0.0
Dermatologic				
Rash	4.0*	1.1	1.3	0.9

Cough	2.6	1.7	0.1	0.0

*Statistically significantly different from placebo.

The following effects have been reported with drugs in this class:

Skeletal: myopathy, rhabdomyolysis.

Neurological: dysfunction of certain cranial nerves (including alteration of taste, impairment of extra-ocular movement, facial paresis), tremor, vertigo, memory loss, paresthesia, peripheral neuropathy, peripheral nerve palsy.

Hypersensitivity Reactions: An apparent hypersensitivity syndrome has been reported rarely which has included one or more of the following features: anaphylaxis, angioedema, lupus erythematous-like syndrome, polymyalgia rheumatica, vasculitis, purpura, thrombocytopenia, leukopenia, hemolytic anemia, positive ANA, ESR increase, arthritis, arthralgia, urticaria, asthenia, photosensitivity, fever, chills, flushing, malaise, dyspnea, toxic epidermal necrolysis, erythema multiforme, including Stevens-Johnson syndrome.

Gastrointestinal: pancreatitis, hepatitis, including chronic active hepatitis, cholestatic jaundice, fatty change in liver, and, rarely, cirrhosis, fulminant hepatic necrosis, and hepatoma; anorexia, vomiting.

Reproductive: gynecomastia, loss of libido, erectile dysfunction.

Eye: progression of cataracts (lens opacities), ophthalmoplegia.

Laboratory Test Abnormalities: Increases in serum transaminase (ALT, AST) values and CPK have been observed (see WARNINGS).

Transient, asymptomatic eosinophilia has been reported. Eosinophil counts usually returned to normal despite continued therapy. Anemia, thrombocytopenia, and leukopenia have been reported with other HMG-CoA reductase inhibitors.

Concomitant Therapy: Pravastatin has been administered concurrently with cholestyramine, colestipol, nicotinic acid, probucol and gemfibrozil. Preliminary data suggest that the addition of either probucol or gemfibrozil to therapy with lovastatin or pravastatin is **not** associated with greater reduction in LDL-cholesterol than that achieved with lovastatin or pravastatin alone. No adverse reactions unique to the combination or in addition to those previously reported for each drug alone have been reported. Myopathy and rhabdomyolysis (with or without acute renal failure) have been reported when another HMG-CoA reductase inhibitor was used in combination with immunosuppressive drugs, gemfibrozil, erythromycin, or lipid-lowering doses of nicotinic acid. Concomitant therapy with HMG-CoA reductase inhibitors and these agents is generally not recommended. (See WARNINGS: **Skeletal Muscle** and PRECAUTIONS: **Drug Interactions.**)

OVERDOSAGE

There have been no reports of overdoses with pravastatin.

Should an accidental overdose occur, treat symptomatically and institute supportive measures as required.

WE'RE BUILDING A GREAT INVESTMENT FOR YOU.

RIVER FALLS
Potomac's Family Community.

These days, it's hard to find an investment that's both prudent and rewarding. Which is why right now is the time to consider the advantages of investing in a River Falls luxury home. You've never had more going for you.

From a strictly financial aspect, River Falls homes have performed admirably. Through the ups and downs over the past 23 years, they've posted a track record of significant appreciation and lasting durability. Marketability that's a testament to timeless designs, construction by teams of in-house craftsmen, and one of the most beautiful, convenient locations in the Potomac/Bethesda area.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities

Today, a River Falls home is still an eminently affordable investment and a smart one too. Four-to-six bedrooms start in the $600's with absolutely no compromise in quality. There's terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go well beyond dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs. Nearby are excellent public and private schools, convenient shopping and easy access to suburban Maryland, downtown D.C., and Northern Virginia.

Where else can you get such a sound investment with such outstanding returns? Take an hour to visit River Falls and see how great your future can be. For you, and for your family.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.
HOURS: 12-5 daily.
PHONE: (301) 299-3700.
Brokers welcome.

OPEN A SEP-IRA UNTIL APRIL 15*

Self-employed?

THERE'S STILL TIME TO SAVE ON 1992 TAXES

T. ROWE PRICE SEP–IRA: AN EASY—AND LOW-COST—RETIREMENT PLAN

If you're a small-business owner or sole proprietor, you have until April 15* to open a SEP–IRA and make tax-deductible contributions for 1992—up to 15% of compensation or $30,000 per eligible employee.

Setting up a SEP–IRA is an easy—and low-cost—way to build retirement savings. SEP–IRAs require no annual IRS filing, involve comparatively little paperwork, and their administrative costs are among the lowest of any employer-sponsored retirement plan. You can vary the amount you contribute each year to reflect your company's financial situation. And, if you have 25 or fewer employees, you can offer them a salary-reduction option.

SEP–IRA BENEFITS AT A GLANCE

- April 15 setup deadline*
- Tax-deductible contributions
- Annual contributions of 15% of compensation per participant, up to $30,000
- Low administrative costs
- No IRS filing
- Earnings compound tax-deferred
- Salary-reduction feature

The benefit of tax-deferred compounding

Earnings compound tax-deferred in a SEP–IRA. That means your retirement savings increase at a faster rate than they would in a comparable taxable account.

The T. Rowe Price advantage

You can invest SEP–IRA contributions in any of our 33 mutual funds—all **100% no load**. If you prefer to buy or sell individual stocks and bonds for a self-directed IRA, you can take advantage of our discount brokerage service. And whether your objectives are conservative or aggressive, you'll find T. Rowe Price has the investments to meet your retirement goals and a staff of experts to assist you. In addition, we offer free retirement planning guides to help you achieve a successful retirement.

SEPI017531

*Or your tax-filing deadline. Request a prospectus with more complete information, including management fees and other charges and expenses. Read it carefully before you invest or send money. T. Rowe Price Investment Services, Inc., Distributor, 100 East Pratt Street, Baltimore, MD 21202.

Enter the Thirteenth Annual Med Chi Photo Contest

David Paul, MD – 1st Place Color, 1991 – Wash Engl

THIRTEEN MAY BE YOUR LUCKY NUMBER

Deadline for entries is Friday, March 19, 1993 ♦ Two categories: black & white or color
Open to all Med Chi and Auxiliary members ♦ First and second prizes awarded in each category

All photographs will be displayed at the 1993 Annual Meeting at the University of Maryland Adult Education Center, College Park.

Photo Contest Rules:

Eligibility: All members of Med Chi and members of the Auxiliary may enter. Professional photographers may not enter. Members of the Photo Contest Committee and their families are not eligible.

1. Photographs may be submitted in two categories: black and white or color.
2. Limit: three entries per person.
3. Prints only, no smaller than 8 x 10" or larger than 11 x 14" will be accepted. If your favorite shot is a slide, you must have a print made within these size ranges to enter the contest.
4. Entries must be matted or dry mounted. No framed photographs will be accepted.
5. Entries must have name, address, and telephone number attached to the back of each photograph.
6. Entries may be mailed or brought to Med Chi, 1211 Cathedral Street, Baltimore, MD 21201 by the close of the business day on March 19.
7. Photographs entered in the contest will be on display at the 1993 Annual Meeting.
8. Prizes will be awarded to the first and second place winners.
9. Winners will be announced at the Annual Meeting of the Medical and Chirurgical Faculty, April 29–May 1, 1993.
10. Photographs will not be mailed back. Photographs may be claimed at the exhibit area at the close of the Annual Meeting at noon on May 1, or at Med Chi thereafter.
11. Med Chi does not guarantee against loss or damage of any kind to the photographs submitted to the contest.

Committee Selection Card

Executive Director's Newsletter

Annual Meeting Preliminary Program

Following this newsletter is a revised preliminary program for Med Chi's 1993 Annual Meeting: "Prevention '93 — Maryland." The preliminary program features detailed information about the meeting including speakers and course objectives for continuing medical education sessions. To register for this meeting, complete the registration form following the preliminary program.

Committee Selection Cards 1993-1994

Med Chi's committees are the backbone of our organization. Decisions made by Med Chi's House of Delegates, Council, and Executive Committee are often guided by the advice of physicians who serve on the more than 45 Med Chi committees. If you are interested in serving on a Med Chi committee during the 1993-1994 committee year, please complete the selection card following this newsletter. Any member can serve on a committee, but you must complete the attached card to be considered for appointment.

BCBSM Executives Visit Med Chi

Three top executives from Blue Cross and Blue Shield of Maryland (BCBSM) met with Med Chi physicians on February 24, 1993 to discuss physician concerns regarding BCBSM. Frank A. Gunther, Jr, chairperson of the board; William Beasman, acting chief executive officer; and Arthur T. Keefe, Jr., M.D., executive vice president, medical affairs, spoke to over 40 physicians about BCBSM. Mr. Gunther assured physicians that BCBSM is a solvent organization. "Our major concern is not a financial concern," said Mr. Gunther, "it's a service concern." Both Mr. Gunther and Mr. Beasman stressed that BCBSM is addressing its service problems for both providers and subscribers.

For more information about recent events at BCBSM, see the article on page 146 of this *MMJ*. A more detailed account of the February 24th meeting will be featured in the March 1993 *MMJ*.

Performing Arts Medicine Conference

"Performing Arts Medicine II: Focus on Young Performers" is a conference on the special problems of performing artists scheduled for March 20-21, 1993 at the Med Chi Faculty Building, 1211 Cathedral Street, Baltimore. Sponsored by Med Chi's Committee on Medicine and the Performing Arts, this conference will include discussions on focal dystonia, eating disorders, Alexander and Feldenkrais techniques, drug side effects, conditioning and physical fitness, problems of marching musicians, and implications of the Americans with Disabilities Act. For more information about this conference, see the ad on pages 218-219 of this *MMJ*.

Room Reservations for 1993 Annual Meeting

Because of busy metropolitan Washington traffic, a long commute, early morning and late evening meetings, Med Chi is encouraging physicians to stay overnight during the 1993 annual meeting. Med Chi has reserved a limited number of rooms at the University of Maryland University College Conference Center in College Park, Maryland at a special group rate of $65.00 for a single occupancy and

$85.00 for a double occupancy room. For room reservations, call 1-800-727-8622 and give Med Chi's group number: G2568. Reservations must be made by March 29, 1993.

"Clearing the Air About Poisonous Gas"

"Clearing the Air About Poisonous Gas" is a special seminar concerning the medical management and the treatment of poison gas intoxication to be held April 29, 1993 at the University of Maryland University College Conference Center in College Park, Maryland from 1:00 p.m. to 5:30 p.m. This seminar, which fulfills 4 CME credits, includes two sessions: a presentation and a panel of experts. Henry J. Seigelson, M.D., F.A.C.E.P., chairperson of the American College of Emergency Physicians' Disaster Section, is the principal speaker. The panel of experts will respond to questions regarding the management of chemical disasters to include contamination, facility/victim decontamination, protective clothing, and treatment of chemical agent victims.

In view of the mustard gas disposal plan at Edgewood arsenal, Med Chi recognizes the importance of educating and training physicians, hospital staff (medical management personnel), nurses, pre-hospital care providers, and others who may be involved in chemical exposure, patient treatment, and facility management roles. There is no charge for this seminar; we are providing this instruction as a public service for you. To register or receive a brochure describing this seminar, contact Med Chi's Communications Department at 410-539-0872 or at 1-800-492-1056.

Seminar for Young Physicians

Physicians under 40 are encouraged to attend "Practice Management Strategies for Young Physicians," a complimentary luncheon seminar sponsored by *Physician's Practice Digest* that will provide useful information on the business side of medical practice. This seminar will be held during the Med Chi annual meeting on Saturday, May 1, 1993, at 12:00 p.m. at the University of Maryland University College Conference Center in College Park, Maryland. To register for this seminar, complete the registration form in the preliminary program following this newsletter.

President's Regional Conference

The President's Regional Conference for Southern Maryland will be held at the Holiday Inn in Solomons, Maryland at 4:30 p.m. on April 1, 1993. Surveys have been mailed to physicians in southern Maryland requesting that they submit subjects of interest. If you wish to submit a topic for the meeting or if you have any questions, call Joan Mannion at 410-539-0872 or 1-800-492-1056.

Med Chi Helps Legislators Quit Smoking

As part of its anti-smoking initiative, Med Chi recently invited Maryland's legislators and their families to attend a special session on "How to Stop Smoking" on March 24, 1993, at the Maryland Inn in Annapolis. During this special presentation, Kevin S. Ferentz, M.D., assistant professor of family medicine and director of Student and Employee Health at the University of Maryland at Baltimore, will explain a number of innovative ways to break the smoking habit.

Maryland physicians are reminded that over 7,600 Maryland citizens die from cigarette-related illnesses each year. That's more than die from alcohol and other drugs, homicide, suicide, car accidents, fires, and AIDS combined. Maryland physicians are encouraged to take part in Med Chi's anti-smoking campaign by encouraging patients to quit smoking.

Anti-Smoking Warning Labels for Magazines

Physicians are encouraged to use Med Chi's new peel-and-stick warning labels for magazines that contain tobacco advertising. The labels read: "Warning: This magazine contains cigarette advertisements. Your physician does not support the use of any tobacco products or the advertising of such products." A sample of the labels appeared in the January issue of the *MMJ*. Additional labels are available at no charge by calling Med Chi's switchboard operator at 410-539-0872 or 1-800-492-1056.

Substance Abuse Education

"Substance Abuse Education for Primary Care Physicians: An Overview of Treating the Substance Abusing Patient" is a Med Chi sponsored program that can be delivered in a 1–3 hour format. This program, which can be held at the Med Chi Building or your place of work, is offered at no charge through August 1993. This program is made possible by a special grant and is limited to locations in Baltimore City. For more information, contact Sandra Heim at 410-539-0872 or 1-800-492-1056.

Maryland Elder C.A.R.E.

Maryland Elder C.A.R.E. is a service not available to the general public, but it is available to you as a Med Chi member. Maryland Elder C.A.R.E. recommends options for elder care aimed at the highest quality of life for the longest possible time. This is a personal service that can help you plan for the complex needs and responsibilities of an elderly relative, which can be time-consuming and confusing. Med Chi members who use Maryland Elder C.A.R.E. pay a service fee of $125 for a professional phone consultation. To use these services, call 1-800-734-7545 and identify yourself as a Med Chi member. If you have any questions about this membership benefit, please call Vivian Smith in Public Relations at 410-539-0872 or 1-800-492-1056.

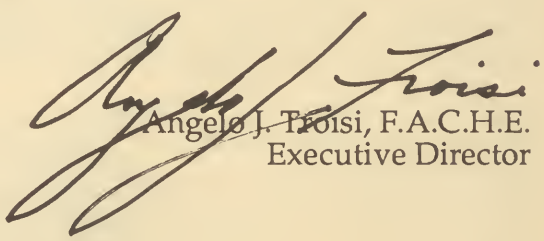
Maritime Atlantic Insurance Company, Inc.

Med Chi has received notice from the Consumer Affairs Division of the Maryland Department of Licensing and Regulation that the Commissioner of Insurance of the State of Georgia has advised that the Maritime Atlantic Insurance Company, Ltd. may not act as an insurer in the State of Georgia or any other jurisdiction.

This company, in association with Physicians Reliance Association, Inc., has been offering medical malpractice insurance to physicians. Medical professionals should be advised that this company is not authorized to write insurance in Maryland.

Physician Testimony in Annapolis

During the legislative session, many physicians may be requested to provide expert testimony in Annapolis as an official representative of the Medical and Chirurgical Faculty of Maryland. Med Chi greatly appreciates the time and effort of the many physicians who have already served in this important capacity.



There are two scenarios in which you may be requested to provide testimony:

1. You may be asked to testify on legislation or an issue that pertains to a Med Chi committee on which you serve.
2. On certain occasions, you may be requested to testify because of your knowledge or expertise in a particular specialty or area of legislative interest.

If you are requested to testify, you will be notified by Med Chi's legislative office about the date and time of the hearing. Med Chi will also brief you on the official position of the Faculty and provide you with copies of written testimony to be submitted to legislators during the hearing. All physicians who provide expert testimony are encouraged to fully cooperate with Med Chi's legislative office regarding Med Chi's official position.

For physicians who wish to testify as private individuals, it is very important that you do not convey the perception that you are in any way representing the Medical and Chirurgical Faculty of Maryland.

Med Chi is grateful for your cooperation in helping to coordinate our efforts in this significant area.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

1:00 pm - 3:00 pm — **"Medical Management in Home Care"**
Med Chi Committee on Long-Term Care and Geriatrics
CME Credit: 2

3:00 pm - 3:30 pm — **Break—Visit the Exhibits**

Support Our Exhibitors

Exhibits are an important part of Med Chi's annual meeting and are a valuable adjunct to the scientific program.

By visiting the exhibits before and after your scientific program, you will help ensure that Med Chi receives valuable income that allows us to offer you annual and semiannual meetings.

Med Chi urges you to express your appreciation to exhibitors by visiting their booths and discussing your mutual involvement in patient care.

* Please note this is a preliminary agenda. More meetings, events, and continuing medical education activities may be added to the advance program which will be published in the *Maryland Medical Journal* prior to the meeting.

Thursday, April 29, 1993

Med Chi Computers in Medicine Committee
CME Credit: None

4:45 pm - 5:45 pm — **"Prevention of Coronary Artery Disease in Women"**
Med Chi Committee on Women in Medicine
CME Credit: 1

Directions

The University of Maryland University College Conference Center is located at the corner of University Boulevard and Adelphi Road in College Park, Maryland.

From Baltimore and points north: Take I-95 South to the Capital Beltway (I-495) toward College Park. Take exit for U.S. 1 South (Exit 25B). Proceed approximately 1 mile south on U.S. 1 and turn right onto MD Route 193 West. At 3rd traffic light, turn left onto Adelphi Road. On Adelphi, make first immediate left onto Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

From Bowie/Annapolis areas and points east: Take MD Route 50 to Capital Beltway (I-95). Go north on 95 to College Park. Take exit U.S. 1 South (Exit 25B). Proceed approximately 1 mile south on U.S. 1 and turn right onto MD Route 193 West. At 3rd traffic light, turn left onto Adelphi Road. On Adelphi, make first immediate left onto Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

From Washington, D.C.: Take George Washington Parkway to I-495 (toward Rockville). Follow I-495 and take exit for New Hampshire Avenue/Takoma Park (650). Go south on New Hampshire Avenue and turn left at the second light (Adelphi Road). Stay on Adelphi Road for approximately 3 miles (you will go through 3 traffic lights). At the 4th light, turn left on Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

From Montgomery County and points west: Take the Capital Beltway (I-495) to New Hampshire Avenue/Takoma Park (650). Go south on New Hampshire Avenue and turn left at the second light (Adelphi Road). Stay on Adelphi Road for approximately 3 miles (you will go through 3 traffic lights). At the 4th light, turn left onto Campus Drive. The Conference Center will be visible on your left. Parking for guests is available in the 4th driveway on the left.*

* A parking garage for the Conference Center is scheduled to be completed May 1, 1993. If necessary, Med Chi will publish updates about parking at the Conference Center in the *MMJ*.

Friday, April 30, 1993

7:30 am - 5:00 pm — **Registration**

8:00 am - 5:00 pm — **Exhibits open**

8:30 am - 5:00 pm — **Auxiliary—44th Annual Meeting**

You may fax your registration to 410-547-0915 or phone your registration by calling Lori Robinson or Vivian Smith at 1-800-492-1056 or 410-539-0872.

Telephone Messages

During the meeting, messages may be relayed to participants by calling 301-985-7300.

Hotel Reservations

The University of Maryland University College Conference Center offers comfortable accommodations complete with color cable television, telephone, private bath, and desk. Guests at the Conference Center can also enjoy a wide variety of recreational facilities including an 18-hole golf course, tennis and racquetball courts, weight rooms, swimming pools, and jogging paths.

Med Chi has reserved a limited number of rooms at a special group rate of $65.00 for a single occupancy room and $80.00 for a double occupancy room.*

To receive this special group rate, you must make your room reservation by **March 29, 1993**. To make a reservation call 1-800-727-8622 and give Med Chi's group number: G2568.

* Tax and incidentals not included.

Miscellaneous

Contact Joan Mannion at 1-800-492-1056 or 410-539-0872 with questions about continuing medical education sessions.

For general questions regarding the annual meeting, call Betsy Newman at 1-800-492-1056 or 410-539-0872.

Our Pictures Are Worth A Thousand Words.

Case #23

59 year old male, routine physical examination, elevated PSA level of 32. Biopsy under ultrasound revealed undifferentiated carcinoma of the prostate gland.

DIAGNOSIS: Prostatic cancer with capsular perforation and seminal vesicle involvement on the left.

MRI of the pelvis employing an endorectal surface coil performed for staging provides increased resolution and soft tissue contrast to allow detailed imaging of the prostate gland. Axial and Coronal images (1 and 2) reveal extensive involvement of the peripheral zone on the left and moderate involvement on the right (arrows). Capsular perforation and seminal vesicle involvement are also present on the left. Axial image (3a) demonstrates normal seminal vesicles (3b) carcinoma of the prostate gland with an intact capsule (arrowheads).

Ultrasonic guided biopsy of the prostate gland is the procedure of choice for diagnosing carcinoma of the prostate gland. MRI evaluation with the endorectal surface coil is the procedure of choice for staging prostate gland cancer. Staging of the neoplasm is important in determining appropriate therapy. MRI, in addition to staging of the gland itself, is excellent for evaluation of the pelvis and retroperitoneal area, detecting adenopathy and osseous metastatic disease.

Still Doing What We're Known For, Only Better.

Sheppard Pratt is known for treating severe and persistent mental illness. While that once may have suggested lengthy or repeated inpatient stays, such a perception would hardly fit Sheppard Pratt today. A full service mental health system, we offer outpatient therapy centers, day hospitals, community rehabilitation programs, and supervised housing in addition to our 322-bed hospital. For patients with schizophrenia or severe dissociative, affective, personality or eating disorders, a hospital stay may be unavoidable. But the Sheppard Pratt advantage is an internal case management function that facilitates movement to a less restrictive treatment setting and return to the referring professional as soon as the patient is ready. We provide a continuum of care within every area of psychiatry:

- Addictions Recovery
- Mood Disorders
- Eating Disorders
- Personality Disorders
- Dissociative Disorders
- Severe and Persistent Mental Illness
- Child and Adolescent Psychiatry (with a K through Grade 12 school on the hospital campus)
- Geropsychiatry

For more information, call or write:

MARYLAND:
WHY PAY TAXES OR SALES CHARGES?

100% NO LOAD

T. ROWE PRICE MARYLAND TAX-FREE BOND FUND

Even if you find a high-yielding investment in today's environment, you could sacrifice over 37% of what you earn to taxes, as a Maryland resident.

T. Rowe Price can help you change that. Earnings from our Maryland Tax-Free Bond Fund are *exempt from federal, state, and local taxes*—letting you keep the income you earn.* And today's tax-free yields are attractive versus comparable taxable yields, so you could earn higher after-tax income from a tax-free fund.

High income in today's low-yield environment

Yields	Total Returns**
8.61% Tax-equivalent 31% tax rate	**8.6%** 1 year ended 12/31/92
5.41% Current yield 30 days ended 12/31/92	**8.9%** 5 years ended 12/31/92
	6.7% Average annual since inception 3/31/87-12/31/92

The Fund invests in long-term municipal bonds issued in Maryland. While these securities involve greater risk than short-term bonds, our Fund managers use our own credit analysis of each issuer, and actively manage the portfolio maturity to reduce these risks.

No sales charges, so all your money works for you. The Fund is **100% no load.** Since there are no broker fees—which can eat up as much as 5% of your principal—all your money gets invested.

Use our free report to help you make an informed decision. *The Basics Of Tax-Free Investing* can answer your questions about municipal securities.

$2,500 minimum. Free checkwriting.

LETTERS TO THE EDITOR

Tobacco: Schools and magazines

This is an update on Tobacco-Free news for 1992. We are pleased to announce that this past June, the Maryland State Board of Education passed a regulation (almost unanimously) banning **all** smoking in public school buildings. This was then reviewed by the attorney general and became law in November 1992. It takes effect in September 1993. Maryland, the cancer capital of the United States, thus becomes the first state to ban smoking in public schools by action of the State Board of Education. Seven states now have smoke-free schools through legislative action. It is expected that the state teachers' union, headed by an avid smoker, will attempt to introduce a bill making smoking a subject for contract negotiations. Needless to say, we consider the issue one of public health, and have faith that the Maryland Legislature shares this view.

We close by once again urging that you ban all journals that contain tobacco ads from homes and offices. The importance of advertising in getting our children hooked on nicotine cannot be overemphasized; the tobacco industry would not be spending ten million dollars per day on advertising if it were not effective. Please note that *Sports Illustrated,* featuring more teenage idols than any other magazine, is the most pernicious of the lot, receiving the largest amount of tobacco money. We must fight this by a boycott until such time as the editors realize their social responsibility.

A happy and smoke-free new year to all.

MIRIAM KLEBANER, M.D.
Tobacco-Free coordinator, Maryland Chapter, American Academy of Pediatrics

No frills insurance needed*

Thank you for the exposé (for me) of Blue Cross/Blue Shield of Maryland in the November 1992 *Maryland Medical Journal.* I have dealt with BCBSM for several years, both as a participating physician and as a subscriber/patient. I know them well. Long have I felt as if I have been treated unfairly, dishonestly, arbitrarily and inefficiently by BCBSM, but stuck with them since while in practice so many patients in my area (Salisbury, Maryland) had BCBSM or nothing, and (as a subscriber), since stopping practice because of Parkinson disease, I could not get any other insurance for myself. Now, I learn that they spent my lifetime premiums on ball games, horse races, and country clubs! The lifetime premiums of the entire Med Chi group and others have been squandered on excessive salaries, perks, and misguided, if not dishonest or illegal, business ventures. Doctors can be held liable for malpractice; why not insurance plans that are supposed to be public service, and not-for-profit? Why not hold boards of directors liable for negligence?

It is an outrage. I have been cheated coming and going and will renew my efforts to get out of BCBSM and get some other insurance. I hope Med Chi will do the same.

Once again, greed is shown to be the cornerstone of the failure of our health care system. Doctors' greed, evidenced by uncompromising high fees, refusal to treat or even see the poor, and profiteering self-referral through ownership

of health care services, combined with a rapacious insurance industry is leading to changes very few (other than patients) will like.

I propose that the Med Chi Faculty of Maryland assume leadership in the reformation of a new physicians' plan for covering basic health care. Something simple, with no frills—just basic care, with emphasis on prevention. Doctors of Maryland should stop dealing with defrauding insurance companies and take care of the people.

C. HERSCHEL KING, M.D.
Ashland, Oregon

*See update on BCBSM on page 146.

A heart-rend(er)ing memorial*

Here's to Dr. Hookman
  Who, under the sly influence
Of that famous Dr. Osler,
  Tried to fool us with a joke—
Or, maybe not, maybe so,
  Was rendered by a wayward magazine editor.

The veil of the temple was rent
  And the vale of tears is rent,
Except for the blessed homeless,
  Those who on their streetside fires
Render rent hearts, kidneys, muscle,
  The galled eyes of oxen,
Into a stew.

To those who know not whereof I speak
  Be patient, read your *MMJ*.
Pay attention to all the footnotes, every one
  Until at page two and one thousand
The minute stimulus of this minute poem
  Is found.
Poor Dr. Osler, whose memorial was so hot aflame
  That he rendered many a heart that day
On a spit of would.
  (O! to follow in the great one's tread!)

WILLIAM A. ANDERSON
Towson, Maryland

*Sir William Osler—Contrasts between the saint-like legend and the rough-edged man. *Md Med J* 1992; 41:1002, footnote k. ■

Update on Blue Cross and Blue Shield of Maryland

The editor's interview with Frank Gunther, Jr., chairperson of the Board of Directors for Blue Cross and Blue Shield of Maryland (BCBSM), in November 1992, included a listing of allegations made by the US Senate Subcommittee on Permanent Investigations. The November and December 1992 issues of the *MMJ* listed actions taken by BCBSM in response to these charges.

As part of an ongoing update to keep members advised about this issue, below is a summary of activity involving BCBSM since December 18, 1992.

December 18

The *Washington Post* reports that BCBSM spent $2 million on lawyers, accountants, and consultants to prepare for the hearing before the US Senate Subcommittee on Permanent Investigations. Venable, Baetjer, and Howard, a Baltimore-based law firm, received $700,000 of that money. Benjamin R. Civiletti, a former United States attorney and partner in the firm, represented BCBSM during the hearings.[1]

January 7

Maryland's insurance commissioner, John A. Donaho, issues an order to block the payment of retirement packages to two BCBSM executives. Donaho issued the order because he claims BCBSM failed to indicate the exact amount of the retirement packages to be paid to former BCBSM Chief Executive Carl J. Sardegna and current Senior Vice President Fred M. Gloth, Jr.[2] The Board of Directors of BCBSM has testified before both the Maryland House and Senate that the retirement packages are currently under review by outside counsel to determine what BCBSM is legally required to pay.

January 9

Commissioner Donaho announces he will seek more power to regulate BCBSM through legislation that would give the insurance commissioner unlimited access to the insurer's accounting records and give him the power to prevent BCBSM from opening new businesses. Although, Commissioner Donaho's proposal does not have the support of Governor Schaefer, Casper R. Taylor, Jr., chairperson of the House Economic Matters Committee, announced that he plans to introduce legislation that would place more stringent requirements on Maryland insurers. In a *Baltimore Sun* article, BCBSM said it supports the commissioner's efforts to more closely examine an insurer's financial condition.[3]

January 13

BCBSM issues a special report to its customers from William A. Beasman, Jr., interim chief executive officer, and Frank A. Gunther, Jr., chairperson of the BCBSM board. The report, which is a model for a quarterly report to customers to be initiated during 1993, includes findings by a special committee appointed by Mr. Gunther to review the company and its operations. The committee concludes

- BCBSM is financially solvent, and
- BCBSM does not have a liquidity problem.

The report breaks down the committee's findings into five areas:

Finance

Under finance, the committee concludes that "the company's financial information and operations are not as controlled as they need be." The committee report states that BCBSM will take several actions to address this problem including review the lease for the Owings Mills building and require detailed financial reports.

Expenses

With regard to expenses, the committee concludes, "Greater expense control is needed." BCBSM's actions to resolve this problem include reducing "1993 administrative expenses to a level below that in 1992"; bringing "executive compensation levels in line with practices of Blues plans of similar size"; reporting "compensation levels of top executives to the public each year"; and creating a "policy regarding the use of outside consultants, including outside legal counsel."

Service

The committee concludes there is "insufficient training for employees in the service areas...." To correct this problem, BCBSM will improve service to customers and centralize and coordinate training of claims personnel.

Communications

The committee also found that there is "insufficient and inconsistent communication." To address this,

BCBSM will develop a 60-member employee group that will create a vision statement for the company and "assist in developing the mission and goals of the company."

The board of directors

Finally, the committee reaffirmed the board's role as a policymaking body and that it should not be involved in the BCBSM's daily operations. The committee added, however, that there is "need for increased oversight of BCBSM's operations," and there needs to be greater accountability of the senior management and board of directors. The report states BCBSM will reduce compensation for board members to $4,000 annually and to $400 for each meeting they attend. The report notes that this figure is below the national average for BCBS plans of similar size. The board will also require more detailed information from senior management. [4]

January 15

The *Baltimore Sun* reports that BCBSM is auditing its lease payments for its Owing Mills headquarters because BCBCM's payment schedule for the property is up to $30 million more than is required by its lease. The article reports that the increase is due to a provision in the BCBSM contract with the Rouse Company that provides for an automatic increase in lease payments to compensate for inflation. Martin D. Klenke, BCBSM's director of finance, stated that the audit was routine, and BCBSM will renegotiate the financing of the contract with the Rouse company later this year.[5]

January 16

BCBSM signs a letter of intent with Electronic Data Systems Corporation (EDS), which would allow the company to manage and enlarge BCBSM electronic health claims network. According to the *Baltimore Sun*, EDS would take over BCBSM's Lifecard, a subsidiary company. Before the agreement is finalized, however, the contract must meet the approval of BCBSM's Board of Directors.[6]

January 20

A *Baltimore Sun* article examines the "precarious role of consultants to BCBSM." The article describes how consultants hired by BCBSM did not accurately present the company's financial condition. In an examination of a number of BCBSM's consultants ranging from Towers Perrin, Arthur Andersen and Co., and Legg Mason Wood Walker, Inc., the article scrutinizes the use of special accounting rules and exaggerated assets in obtaining information for consultants' reports.[7]

January 23

William A. Beasman, Jr., acting chief executive of BCBSM, requests Fred M. Gloth to delay retirement and help with the day-to-day operations of BCBSM. Mr. Beasman cites in a *Baltimore Sun* article that one reason for asking for the delay in Mr. Gloth's retirement was because much of the top management has resigned from BCBSM and Mr. Gloth's knowledge of the company is "invaluable."[8]

January 27

The Health Care Financing Administration (HCFA) warns BCBSM that it failed to meet minimum standards for payment of claims for Medicare Part B. HCFA tells BCBSM that they must improve quality in the areas of claims processing, quality assurance, and customer service. HCFA notes that BCBSM failed to meet its standards which include a maximum 10% error rate on claims processing and a 1.5% maximum error rate on overpayments or underpayments. BCBSM has until April 30, 1993 to make improvements. If the insurer fails to meet HCFA's requirements, HCFA may not renew its Medicare contract with the insurer. BCBSM states that it will correct the problems, which stem largely from the installation of a new computer system in October 1992 and the simultaneous implementation of the RBRVS payment process. BCBSM says it has already met HCFA requirements for claims processing and hopes to solve other problems with HCFA by the end of February.[9]

February 3

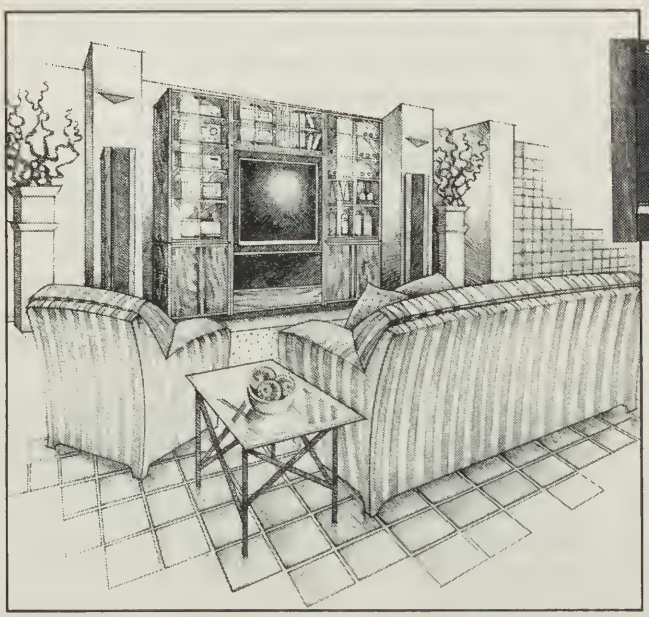
The House Economic Matters Committee holds a hearing on two bills designed to place more stringent requirements on BCBSM. During the hearing, BCBSM Senior Counsel John A. Picciotto said that the requirement for 50 persons inside BCBSM to be responsible for reporting the company's insolvency to regulators could be subject to abuse. He also stated that those persons in the group who have no financial expertise would not be able to accurately assess the company's financial condition. The bills require two consumers to sit on the BCBSM Board of Directors and increase civil penalties for members of the board from $1,000 to $5,000. For officers of the company, fines would be increased to $50,000.[10]

February 5

Med Chi arranges a meeting with top executives from BCBSM to allow Med Chi physician leaders and BCBSM executives to exchange information about current insurance issues. Results of the meeting, which is scheduled for February 24, 1993, will be reported in a future issue of *MMJ*.

February 6

Following a January 28 meeting, BCBSM Board of Directors Chairperson Frank A. Gunther announces that BCBSM will postpone a decision on entering into a contract with EDS until it receives an "objective" expert opinion. Mr. Gunther states that the board will now meet monthly rather than eight times a year, so that board members can monitor finances more closely. Fred M. Gloth, Jr. will retire February 14. In a comment to the *Baltimore Sun*, Mr. Gloth said he intends to stay on and help with daily operations without pay.[11]



February 17

BCBSM announced the appointment of William L. Jews, a hospital executive, as the new CEO. Mr. Jews graduated from Johns Hopkins University in 1974 with a degree in social and behavioral sciences. After graduation, he worked as a planning official for the University of Maryland and subsequently ran Lutheran Hospital and the Liberty Medical Center. In his new position, he will earn between $400,000 and $500,000—average compensation for a Blues plan similar to Maryland's—although the exact mix of base pay and bonus dollars has not been established. Chairperson Gunther said that Jews "is the medicine we need," as he has over 15 years experience tackling finance, personnel, and political issues with aplomb.[12]

Combined dopamine and serotonin agonists: A synergistic approach to alcoholism and other addictive behaviors

Pietr Hitzig, M.D.

ABSTRACT: *Successful phentermine and racemic fenfluramine treatment of 150 obese patients led to the use of this therapy in 12 alcoholic patients. Eleven of 12 consecutive patients, most within hours, reported a total loss or marked decrease in alcohol craving. Their reported consumption of alcohol ceased or decreased markedly. The hypothesis is proposed that this treatment is successful because of the dual and balanced increase in the bioavailability of the neurotransmitters, dopamine and serotonin, in the* nucleus accumbens. *The prospect is raised that cocaine, nicotine, narcotic, and amphetamine addiction, as well as various presentations of obsessive compulsive behavior, may also respond to dual aminergic agonists. The need for controlled studies to confirm these findings is clear.*

The author has treated 150 obese patients with conjointly administered racemic fenfluramine hydrochloride, a serotonin agonist, and phentermine hydrochloride, an amphetamine-like dopamine agonist. Significant weight loss has resulted, the adverse effects have been minimal, and the drop-out rate has been less than 20%.

To test the hypothesis that combining these same aminergic medications may also synergistically control alcoholism, the author began testing a similar protocol on 12 patients who used alcohol heavily. The initial dose of fenfluramine was 80 mg daily in the alcohol study and 20 mg in the obesity study. The daily starting dose of phentermine was 30 mg in both studies. Eleven of 12 consecutive patients reported a marked or total decrease in their alcoholic craving and consumption, usually in less than 24 hours.

Representative case histories

Ms. A, a successful non-obese executive in her late twenties, is the progeny of two alcoholics. In addition, there is a strong family history of depression, alcoholism, and suicide. From the age of 7 to 17, her father sexually abused her. For at least the previous 10 years, Ms. A has had a

stormy alcoholic history and reported that for years she had been binge drinking, despite attendance at Alcoholics Anonymous (AA) meetings. An inpatient on at least five occasions, her marriage was in dissolution. Her employers, understandably, wondered whether they could continue to employ her. Prior to the prescribing of the aminergic medications, Ms. A reported that she suffered from ever-present alcohol cravings and obsessional ideation relieved only by alcohol.

Ten weeks after she started the medications, she reported "absolutely no craving." She continues to attend Alcoholics Anonymous (AA) meetings, and marvels at her voluntary alcoholic abstinence and lack of craving.

Professor B, a college educator in his early fifties, initially came to the author's office several years ago for treatment of refractory hypertension. When questioned, the patient candidly discussed his alcohol history of more than one pint of vodka nightly. Up to the time of his interview, he asserted he had no insight into the possibility of alcoholism. He readily abstained from alcohol, lost 30 pounds, and became normotensive. Over the next two years, he gained weight and once again had labile hypertension. He frankly commented that his alcohol craving had led to a resumption in drinking.

After beginning treatment with the conjointly administered aminergic agonists, the patient once again started to lose weight. The weight loss, however, was not at the rate expected for someone of his age and weight. When the fenfluramine dose was increased to 80 mg, he reported that he lost his desire for alcohol, and his weight loss became precipitous. At 10-week follow-up, he reported that he had not consumed any alcohol for the entire period.

Mr. C, a patient in his early sixties, was started on the medications. After eight weeks, he also indicated that he had completely lost his craving for alcohol and was no longer drinking. He stated that if he drank at all, he limited it to a can or two of beer. He has started a support group designed to help people who are beginning the protocol.

Mrs. C, the patient's wife, interviewed alone, reported being happy with the course of treatment. She stated that the patient was a "new man," far more energetic and much less irritable.

Discussion

The addictions of alcohol[1] and food are under increasing pharmacologic attack. Against alcoholism are arrayed various re-uptake inhibiting serotonin agonists[2] including fluoxetine[3] and citalopram.[4] In addition, Krasner[5] and colleagues have studied fenfluramine, a serotonin agonist but not a classical serotonin re-uptake inhibitor. These drugs alone cause significant but modest decreases in alcohol consumption.

Against hyperphagia, the front is even more advanced. Over the last 10 years, Hoebel[6–8] and his associates at Princeton have integrated experiments done elsewhere with their own elegant work. Their model will continue to guide many researchers to rewarding areas of experiment. Weintraub and colleagues reported in 1984[9] and in 1992[10] that together, fenfluramine and phentermine act synergistically against food craving and obesity. They stated that this combination "capitalized on pharmacodynamic differences, resulting in equivalent weight loss, fewer adverse effects, and better appetite control." Weintraub et al continued the use of these medications for three years, and the results strongly suggest that obesity can be managed as a chronic illness without untoward medication-induced side effects or tachyphylaxis.

Of invaluable benefit to neurophysiologic research have been animals with electrodes placed in the medial forebrain bundle of the brain, who have been trained to self-stimulate themselves. When the animal presses a pedal, dopamine is released and the animal is thereby rewarded. Many studies using this procedure as a model for addictive behavior have been performed over the years. A recent study by Olds et al[16] showed that while racemic fenfluramine by itself decreased the rate of self-stimulation, combining fenfluramine with amphetamine was far more effective. These chemicals, administered together, abolished lever pressing for up to three hours. The researchers believe that their findings support a dopamine-serotonin interaction in self-stimulation behavior [and the author suggests a possible interaction in addictive behavior].

There are many similarities between primary obesity and alcoholism. They include the following.

- The ingestion of either food or drink increases dopamine and serotonin in the *nucleus accumbens* (NAC).[6,12–15]
- Craving and loss of control in alcohol abuse and dependency may have a neurophysiologic basis within basal ganglial/limbic striatal and thalamocortical neuronal systems. These same dopaminergic systems are involved with neuronal modulation of hunger and satiation.[16]
- Both food and alcohol cravings are modestly ameliorated by serotonin agonists.

In normal subjects, dopamine and serotonin production decrease from waking to sleep.[17] The author postulates that the non-addicted, or normal subjects, reverse this dual amine decline by consuming their main meal of the day after sunset. If they wish, alcohol consumption and sexual relations will further briefly maintain high levels of extracellular serotonin and dopamine in the NAC. Moderate alcoholic or hyperphagic, individuals however, with greater aminergic deficits, have to exaggerate normal hedonistic evening activities to maintain normal euphoric levels. Individuals who are morbidly obese, bulimic,[18] or severely alcoholic have, unfortunately, inadequate aminergic production in the NAC. They try to control their resulting dysphoria by excessively eating or drinking earlier in the day. Unable to stimulate aminergic production sufficiently, these descendants of Tantalus rarely reach satisfaction.

The question of whether an addictive problem should be managed with drugs derived from amphetamines cannot be ignored.[14] It should be noted that not one patient in either of the author's treatment groups has developed amphetamine tolerance, let alone addiction. Dr. Weintraub and colleagues noted no drug-seeking behavior during their entire study.

There are no reports in the medical literature since 1966 of phentermine substance dependence. Fenfluramine has little potential for substance abuse.[19]

Could these medications, or different ones, be effective against other addictive and obsessive-compulsive disorders? There are many intriguing articles that support this possibility.

- Jimerson and colleagues[20] show that dopamine and serotonin metabolites in the cerebrospinal fluid (CSF) are decreased in patients with bulimia. Fluoxetine and naltrexone together are more effective against heroin addiction than naltrexone alone.[21]
- Pollack shows that fluoxetine alone is effective in about 50% of individuals who are addicted to cocaine and who are also addicted to heroin and participating in a methadone program.[22]
- Direct nicotine stimulation of the NAC causes a rapid *in situ* increase in dopamine bioavailability.[23–25] Damsma[26] believes that the mesolimbic dopaminergic system is a substrate for the reinforcing properties of chronically administered nicotine.
- Sellers[2] makes the point that serotonin-enhancing animal experiments lead to a decrease in self-administered "ethanol, morphine, cocaine (but not in all studies), and amphetamines."
- Di Chiara[27] forthrightly states that all "drugs abused by humans (e.g., opiates, ethanol, nicotine, amphetamine, and cocaine) increased extracellular dopamine concentrations in ... the NAC."
- Finally, imipramine, the stereotypical tricyclic, does not increase synaptic dopamine concentrations in the mesolimbic system nor does it suppress drug or food self-administration. Fenfluramine, however, and presumably the so-called "pure serotonin re-uptake inhibitors," mildly increase dopamine bioavailability at the NAC.[28,29]

One can speculate that serotonin re-uptake inhibitors modestly lessen most drug and food cravings as a result of this dual aminergic influence. If that supposition is correct, one can then postulate that with the addition of phentermine or another major dopamine agonist, other substance cravings, as well as obsessive-compulsive behavior disorders,[30,31] will be more effectively addressed.

These drugs are not meant to replace other modalities. Programs such as Alcoholics Anonymous, behavior modification, and many others, freed of having to deal with the craving that so often leads to recidivism, could then focus on the other complex issues of dependency and conditioning.

These data are only preliminary. Controlled studies must substantiate that this consecutive series of successfully treated alcoholic patients is clinically significant. Animal and human clinical data do support the author's speculations and results. The serious morbidity and mortality resulting from substance addiction and extreme forms of obsessive-compulsive behavior force every primary health care provider to decide when to initiate therapy.

Acknowledgments

The Professional Arts Pharmacy in Catonsville, Maryland searched out both generic fenfluramine and phentermine, not an easy task, and triturated the two powdered chemicals with hydroxypropylmethyl cellulose (45 milligrams HPMC/#1 capsule). The use of generics holds the maximum daily cost to less than 80 cents. Dr. Reginald A. Davis has reintroduced me to the complexities of the mesolimbic system. Ms. Debra Peters of the Greater Baltimore Library has responded to importunate demands and the Board of Directors of the Hospital for the Women of Maryland has been extremely supportive. ■

Medications to treat alcoholism?

Alcohol dependence is one of the most preventable and treatable public health problems in our society. Even though existing treatments of alcoholism can be effective, they are not effective in everyone and often result in abstinence or nonhazardous drinking for only a short time. Hence the observations by Dr. Hitzig that the combination of fenfluramine and phentermine decrease alcohol craving and alcohol use and may therefore constitute a treatment of alcoholism are important. Medications offer one of the most likely ways to improve the treatment of alcoholics. Naltrexone, fluoxetine, and ondansetron, among others, have been shown to have a potential role in treating alcoholics.[1–3]

The author's observations are particularly interesting because they have considerable theoretical support from preclinical behavioral pharmacology studies. Pharmacological agents that increase serotonin (5-HT) in the brain can decrease alcohol consumption.[4,5] Most also decrease food intake. Fenfluramine is a racemic mixture of a drug that releases serotonin in the central and peripheral nervous system and inhibits its re-uptake into the neuron. Studies with its d-isomer (dexfenfluramine) have shown that the consequence of this is that 5-HT concentration increases at the receptor sites and that alcohol consumption decreases in laboratory animals.[4] Serotonin uptake inhibitors, such as fluoxetine (Prozac), also decrease alcohol self-administration by rats and have the same effect in patients with alcohol dependence and abuse.[3,4]

Phentermine is an adrenergic compound structurally related to amphetamines. Such agents typically increase dopamine and noradrenaline concentrations at their respective receptor sites in the brain. Dopamine is known to play a role in the self-administration of a variety of drugs, in laboratory animals, including alcohol, cocaine, and heroin.[6]

In the case of ethanol, however, clinical evidence for such a role is not available.

Despite a potential rationale for the synergistic interaction of fenfluramine and phentermine, clinical medicine is filled with great promises that have not been confirmed when controlled clinical trials have been conducted. Disulfiram (Antabuse), the most commonly prescribed medication for alcoholism, was thought for many years to have selective pharmacological effects. Proper clinical trials showed its limited efficacy was due to its nonpharmacological effects on compliance and expectancy. Controlled trials of fenfluramine and phentermine at various dose combinations, compared with each alone and with a placebo. are the next step. Some tolerance to the effects of both fenfluramine and phentermine may occur in the treatment of obesity; hence, whether the effects reported in Dr. Hitzig's patients will be sustained should also be a focus of future study. While an effect on craving or the desire to drink may be important, it will be essential to demonstrate that alcohol consumption decreases irrespective of any effect on the self-report of craving.

There are also likely to be substantial safety issues to be considered in the use of this combination in alcoholic individuals. For example, phentermine has a variety of side effects that might be expected to be more common and more serious in alcoholic patients than in other patients (e.g., palpitations, hypertension, central nervous system stimulation). While phentermine does not seem to have a very high risk of abuse, its pharmacological properties suggest that alcoholic individuals might be more likely to abuse such a medication. Serotonergic agents, particularly in combination with other agents, often cause sexual dysfunction, sleep disturbances, and gastrointestinal system side effects (e.g., nausea, diarrhea). Clearly, careful studies of the acute and chronic interaction of these two drugs in alcoholics are needed.

Because fenfluramine and phentermine have different mechanisms of action, one would normally anticipate that a greater pharmacological effect at lower doses and with lesser toxicity than either medication alone could be achieved. Unfortunately, combination therapy is not popular with pharmaceutical companies and regulatory agencies. Proving that efficacy is greater with the combination than with the individual constituents and identifying a dose combination that will suit all patients proves to be a complex and expensive undertaking. Combination therapy, however, is common place for serious illnesses such as hypertension, asthma, and various mental disorders. Alcoholism certainly qualifies as a serious disorder and one where single medication therapy has not yet provided consistent therapeutic effects. There are normally few incentives for pharmaceutical companies to develop combination therapy; hence, future studies of this combination would likely need to be sponsored by a national funding agency such as the National Institute on Alcohol Abuse and Alcoholism (NIAAA) or private foundations.

Finally, the least difficult but not inconsequential matter to be settled if this clinical observation is confirmed will be whether to call the new product phenfluramine or fentermine!

Because One Size Doesn't Fit All...

New Humulin 50/50 is the tailor-made answer to individual patient needs. A unique combination of equal amounts of Regular human insulin and NPH human insulin, it will be useful in situations in which a greater initial insulin response is desirable for greater glycemic control.

Like Humulin 70/30*, new Humulin 50/50 offers the convenience and accuracy of a premix. And it can be used in conjunction with an existing 70/30 regimen.

***New* Humulin 50/50**

50% human insulin isophane suspension
50% human insulin injection (recombinant DNA origin)

The Newest Option in Insulin Therapy

WARNING: Any change of insulin should be made cautiously and only under medical supervision.

* Humulin® 70/30 (70% human insulin isophane suspension, 30% human insulin injection [recombinant DNA origin]).

Chronic polyarthralgia in adults

John Meyerhoff, M.D.

Dr. Meyerhoff is a rheumatologist in the Department of Medicine, University of Maryland School of Medicine and Sinai Hospital.

ABSTRACT: *Rheumatologists often see patients with musculoskeletal complaints who do not always have symptoms and findings that fit into recognized syndromes. Twenty-two such patients with chronic polyarthralgias, including eight with a positive test for ANA (anti-nuclear antibodies), seen over a seven-year period, did not meet criteria for classification or diagnosis of any recognized rheumatologic syndromes. The mean follow-up since onset of symptoms was 77.5 months (range, 13–276 months). During this time, none of the patients' conditions evolved into any previously recognized syndromes. This report on the study of these 22 patients emphasizes the existence of such patients and comments on their prognosis and treatment.*

Rheumatologists often see patients who do not meet the diagnostic or classification criteria for various rheumatologic diseases, nor do they seem to have any other recognized syndrome. This is particularly true of patients who complain of pain and swelling in their joints, but who, on examination, do not have the usual signs of inflammation—namely warmth, erythema, or swelling. Trying to fit these patients into diagnostic categories may not be in the best interest of the patients or of physicians.[1]

Over a seven-year period, 22 such patients with chronic polyarthralgias, who did not have a known rheumatologic syndrome, have been seen by the author, a board-certified rheumatologist. After adequate evaluation and follow-up, these patients need to know that they have a syndrome with a good outcome; they need reassurance that they do not have systemic lupus erythematosus (SLE), even if they have a positive test for ANA (anti-nuclear antibodies).

Patients and methods

The charts of all patients initially seen between July 1, 1981, and November 1, 1988, were reviewed to identify patients with chronic joint pain of greater than 12-months duration who did not have chronic joint inflammation or a diagnosis of a known rheumatologic disease or syn-

drome. Twenty-four patients fit this definition. Two patients with positive tests for rheumatoid factor of 1:80 (latex fixation) and 62.2 IU (≤ 60 = normal) in the absence of joint swelling were excluded to reduce potential diagnostic confusion with rheumatoid arthritis (RA). Eight of the remaining 22 patients had positive tests for ANA using Hep-2 cells as a substrate. Anti-DNA and anti-Sm assays were negative in all eight patients.

An attempt was made to contact the 22 patients who had not been seen in the previous six months or who had a disease duration of less than 24 months to ask them about their symptoms, medications, and health. All but four patients could be contacted. These four patients had symptom durations of 13, 24, 84, and 126 months from onset of symptoms to last follow-up.

The eight ANA+ patients were compared with the remaining 14 patients using the Wilcoxon rank sum test, since the groups could not be considered to be normally distributed.[2]

Results

Of the 22 patients with chronic polyarthralgias seen between July 1, 1981, and November 1, 1988, 21 (95%) were female. Nineteen of the patients (86%) were white; the other three were African-American. The patient population from which these patients were selected was 75% female and 69% white. There were no statistically significant differences in age of onset, the duration of symptoms or follow-up, or distribution or type of joint symptoms between the ANA-positive and ANA-negative patients.

The mean duration of symptoms from onset to last follow-up was 77.5 months (range, 13–276 months). By necessity, these numbers represent approximations since some patients reported their onset as "in childhood" or "more than 10 years ago." Only two patients had a duration of symptoms less than 24 months. The mean age of onset was 32.1 years. One patient had an onset at age 10, 16 had an onset between age 11 and 39, and the remaining five patients had an onset between age 40 and 50.

The patients reported symptoms in 2 to 16 joints with a mean of 8.5 symptomatic joints (**Table 1**). Joint groups—MCP (metacarpophalangeal), MTP (metatarsophalangeal), or IP (interphalangeal)—were counted as one joint if unilateral and two if bilateral. Four patients reported arthralgias only, including the one male who had symptoms only in his PIP (proximal interphalangeal) joints bilaterally. The remaining 18 patients all reported having had signs of inflammation. Examination, however, rarely confirmed these subjective complaints even when the patients believed they were currently present. Three of these 18 patients had no abnormal joints on examination, and six of them had pain on palpation or motion of the joints in one to eight joints (mean of 3.6 joints) with no evidence of inflammation. The remaining nine patients had warmth, erythema, or swelling in one to six joints (mean of 2.4 joints). Not all of the involved joints were inflamed at the same time.

The most commonly involved joints were the MCPs and knees, wrists and PIPs (**Table 2**). Five patients reported having some symptoms in the axial joints, and three others had tenderness on palpation somewhere in the spine or over the sacroiliac joints. Involvement of the small joints of the feet was unusual.

The intensity of symptoms varied. Four patients had chronic pain but did not take analgesics for the discomfort. All of the patients had adequate relief of their symptoms with nonsteroidal anti-inflammatory drugs (NSAIDs). None of those patients who were employed had stopped working because of their joint symptoms.

Only seven patients had radiographs, most often because of severe symptoms unresponsive to NSAIDs, to determine if erosive changes consistent with RA had occurred. This would indicate that more aggressive therapy was appropriate in the absence of a clinical diagnosis of RA. These studies, done within a mean of 43.6 months after the onset of symptoms (range, 8–75 months), failed to reveal any evidence of joint erosion or destruction.

Table 1. Demographics and joint involvement of each patient

Pt. #	Age (onset)	Duration (m)	Joints involved

AS=axial skeleton, S=shoulder, E=elbow, W=wrist, C=MCP, P=PIP of hands, D=DIP of hands, H=hip, K=knee, A=ankle, T=MTP, PF=PIP of feet, DF=DIP of feet.

None of the patients demonstrated joint laxity on examination. One patient developed flexion contractures of her knees and elbows without having had inflammatory episodes in those joints. Otherwise, this syndrome does not seem to cause permanent damage to articular structures.

All of the patients were, by exclusion, rheumatoid factor negative, with an average of 40.3 months (range, 1–276 months) between onset of symptoms to last rheumatoid factor assay. Eight of the 20 patients tested had a positive (1:40 by Hep-2 cell) ANA assay with a median titer of the positive results of 1:480 and a mean of 1:730. A speckled pattern was seen in five patients, a homogeneous pattern in one patient, a nucleolar pattern in one patient, and a mixed homogeneous and speckled pattern in one patient. Anti-Ro and anti-La antibody assays were performed in five of the eight ANA-positive and four of the 14 ANA-negative patients, with negative results in all nine cases.

Erythrocyte sedimentation rates (ESR) were performed at least once on 20 of the patients. The mean maximum ESR obtained on any of the patients was 24 mm/hr with a range of 0 to 60. Only four patients had an ESR greater than 20 mm/hr.

None of the patients' syndromes would be classified as RA by the 1987 American Rheumatism Association (ARA) criteria,[3] which require patients to meet four of the criteria for classification as RA (**Table 3**). None of the patients met the 1971 or 1982 classification criteria for SLE, [4,5] each of which also requires patients to meet four criteria. The only clinical criterion other than arthritis present in these patients was Raynaud phenomenon, which occurred in two ANA-positive patients and in one ANA-negative patient. (Since Raynaud phenomenon is included only in the 1971 list and ANA only in the 1982 list, no patient had more than two criteria from either list.) None of the patients met the major criterion—sclerodermatous skin changes—of the ARA scleroderma criteria.[6] None of the patients had signs or symptoms (e.g. erythema chronicum migrans or sausage digits) with specificity for known arthritic or connective tissue diseases.

Two patients complained of sicca symptoms, but neither patient had dry eyes or mouth on initial examination nor any parotid enlargement or lymphadenopathy. Both had normal joints on examination. Therefore, Sjogren syndrome was not the suspected cause of their arthralgias. None of the remaining patients had sicca symptoms or dry eyes or mouth on examination.

Eight of the patients had pain and/or tenderness in the spine or sacroiliac joints. None of them had typical symptoms of inflammatory spondylitis (morning stiffness or improvement with exercise) or nonaxial findings of a spondyloarthropathy (nontraumatic enthesopathy, sausage digits, keratodermia blennorrhagica, etc.). None of the patients had psoriasis or symptoms consistent with inflammatory bowel disease.

None of the patients ever experienced an episode of podagra. Only one patient, a 41-year-old female, had an elevated serum uric acid of 7.9 mg/dl (normal, 2.0–7.1 mg/dl). None of the patients had what appeared to be the "pseudorheumatoid" presentation of CPPD (calcium pyrophosphate dihydrate) disease.[7]

Fibromyalgia was actively considered prospectively in all 22 patients, but none of them fulfilled the 1990 American College of Rheumatology criteria for fibromyalgia.[8] The mean age of onset went against a diagnosis of osteoarthritis, and with the exception of one patient with bony enlargement

of one PIP joint, none of the patients had any Heberden or Bouchard nodes. Thyroid function, measured in 17 patients, revealed normal values.

Discussion

The patients presented in this study did not fall into any obvious diagnostic group. Despite a female predominance, a mean age of onset similar to rheumatoid arthritis (32 versus 35 years), and joint pain, they clearly did not have RA. These patients did not have a chronic inflammatory arthritis, which is the *sine qua non* of the diagnosis of RA. They had chronic polyarthralgias in the absence of any defined rheumatologic syndrome. Could these patients be similar to groups reported previously as seronegative rheumatoid arthritis or other syndromes?

In one study of seronegative rheumatoid arthritis,[9] "nearly all" the patients had classic or definite RA, and "only a few" had probable RA by the 1958 ARA criteria for RA.[10] In a second study,[11] all of the patients had definite or classic RA by the 1958 criteria. (Because the 1958 criteria were clearly too sensitive and overdiagnosed RA, the ARA adopted the revised criteria.) Using the 1958 criteria, none of the 22 patients discussed in this report could be classified as having classic or definite RA, and only three of the 22 patients presented here could be classified as having "probable" RA. The remaining 19 did not meet even this minimal level of diagnosis. Thus, this group of patients did not seem to have what has been reported previously as seronegative rheumatoid arthritis.

Lawrence and Bennett reported from England an entity they called "benign polyarthritis."[12] They believed that most of the patients had either acute rheumatic fever (ARF) or Still's disease. It is unlikely, given the low incidence of ARF in the United States, that many, if any, of the patients described here had undiagnosed rheumatic fever. None of them had a history of childhood rheumatic fever, symptoms suggesting rheumatic fever, or a significant childhood illness that would suggest Still's disease.

Feigenbaum, Masi, and Kaplan reported on a group of newly diagnosed, younger adult patients with rheumatoid arthritis.[13] Among these patients were 18 who were followed for at least three years, and who, on last follow-up, had no swelling on examination and no erosions on x-ray. At entry, these patients had an average of 6.9 joints with abnormality on examination, with an average of 2.9 swollen joints. Only two of these 18 patients met the 1958 criteria for definite or classic RA, and none were seropositive. While these patients had mild rheumatoid arthritis (based on their lack of inflammation at last follow-up), they all initially had enough inflammatory process to be diagnosed with RA at the onset of their disease. The three patients in the present group with "probable" RA by the 1958 criteria most resemble these 18 patients.

Feigenbaum, Masi, and Schoon further reported, in abstract form, 21 seronegative females with "a chronic peripheral seronegative arthritis syndrome," which they called "arthritis of unknown diagnosis (AUD)."[14] These 21 women had an average of 1.4 swollen joints on initial examination and seemed to be a heterogeneous group. Their major complaint was arthritis rather than arthralgias. Since this group has not been reported in detail, it is not clear if any of these patients were similar to the patients reported on here.

Palindromic rheumatism differs from the syndrome described here in that patients with palindromic rheumatism have episodes of arthritis that last only hours to days, and they are asymptomatic between episodes.[15] They share the lack of damage in the affected joints and a long-term maintenance of normal function in these joints. Patients with fibromyalgia have peripheral arthralgias as a predominant symptom;[16] the patients reported here did not meet criteria for fibromyalgia. For unclear reasons, fibromyalgia patients and the patients reported here were predominantly female. However, female predominance is common in many rheumatologic diseases such as RA and SLE.

Greer and Panush described a group of patients with a diagnosis of "incomplete lupus erythematosus" (ILE).[17] Patients referred for evaluation of SLE, but who met only two or three of the 1982 SLE criteria, were included in the study. Eighty-two percent of the patients were ANA positive, and 47% had arthritis. Cutaneous manifestations were the most common findings of SLE among these patients, with 61% having malar or discoid rashes, or photosensitivity. These patients with ILE may be similar to some of the ANA-positive patients discussed in this paper, although cutaneous manifestations were absent in the latter group.

The use of "incomplete lupus" as a name for the syndrome they described is unfortunate. Greer and Panush explicitly state that they do not regard ILE as a subset of SLE, and only two of their patients developed SLE. But for those who do not read the paper carefully, the connotation of the title suggests that the authors perceive some connection.

These patients who do not meet the criteria for any recognized rheumatologic syndrome remain a diagnostic dilemma. Given that all of the patients got relief from their symptoms with NSAIDs and none of them developed destructive joint changes, one can justify performing only a limited number of diagnostic studies. After a while, patients with obscure diseases will just stop reporting their symptoms to their physician if the diagnostic studies do not lead to therapeutic benefits.[18]

Viral infections, such as parvovirus B19, can lead to chronic arthralgias, but diagnosis depends on demonstrating immunoglobulin M antibodies at the time of onset of symptoms[19] since 60% of adults demonstrate immunoglobulin G antibodies. In the group of patients reported here, the chronicity of symptoms makes associating the symptoms with a particular prior viral infection impossible. HLA-B27 (human leukocyte antigen) testing was not done in these patients since the clinical history for spondylitis (about which all of these patients were questioned, and which was not present in any of them) is as sensitive and more specific than HLA testing in diagnosing ankylosing spondylitis.[20]

Conclusion

The major goal of this paper is to emphasize the existence of patients with chronic arthralgias whose symptoms do not

progress. Such patients, whose conditions do not evolve into previously recognized rheumatologic syndromes, should not be described in terms of other syndromes. Even a positive ANA (with a negative anti-DNA and anti-Sm) should not lead to a diagnosis of lupus.

At a minimum, the connotations of a diagnosis of "incomplete lupus" or "mild lupus" may lead to unnecessary anxiety among patients and their families. This concern prompted Lockshin's *Journal of Rheumatology* editorial in 1989[1] and a more recent one in the same journal in 1991.[21] The latter editorial suggested that physicians should not identify patients with arthralgias and even oligoarthritis and a negative or low-titer ANA by the term lupus.

Patients with these symptoms in the absence of other rheumatologic syndromes should know that although no name exists for their syndrome, other patients have presented with the same symptoms. If patients have had symptoms for several years, the physician can probably give reassurance that, although the symptoms may continue, it is unlikely that they will progress. They need to know that they do not have SLE, even if they have a positive ANA.

Lyme disease in outdoor workers on Assateague Island: High tick-exposure but low disease risk

Colleen Parrott, R.N., M.S.; Karen Johnson, Dr.P.H., R.N.; Stephanie Strauss, M.D., M.P.H.; Martha Greco, D.V.M.; Ebenezer Israel, M.D., M.P.H.; and Brian S. Schwartz, M.D., M.S.

ABSTRACT: *Lyme disease is endemic to the Assateague Island area. Using a questionnaire and serosurvey, we examined the extent of tick exposure, compliance with recommended Lyme disease personal preventive activities, and risk of the disease in 86 outdoor workers on Assateague Island before and after the summer of 1989. Despite high self-reported tick exposure and relatively long employment durations on the island, there was no evidence of current or past infection with* Borrelia burgdorferi, *the causative agent of Lyme disease. Lyme disease knowledge and use of several personal strategies were high, but compliance with these preventive strategies was not universal. These data suggest that even in this high-risk population, intensive educational efforts are necessary to encourage Lyme disease preventive behavior, but the current level of compliance may have decreased the risk of Lyme disease on the island.*

Ms. Parrott is a public health nurse, Somerset County Health Department, Westover, Maryland. Dr. Johnson is a member of the Department of Health Sciences, Salisbury State University, Salisbury, Maryland. Drs. Strauss, Greco, and Israel conduct the Epidemiology and Disease Control Program, Maryland Department of Health and Mental Hygiene, Baltimore. Dr. Schwartz is assistant professor, Division of Occupational Health, Department of Environmental Health Sciences, Johns Hopkins University School of Hygiene and Public Health, Baltimore.

The number of Lyme disease cases increased tenfold in Maryland from 1987 to 1990.[1] In 1990, 238 cases met the Centers for Disease Control (CDC) case definition. In 1991, the number of CDC-confirmed cases increased 19% over 1990, with 283 such cases (Maryland Department of Health and Mental Hygiene, 1992). Lyme disease was reported in all Maryland counties in 1991, except Garrett and Washington counties. Five counties—Anne Arundel, Baltimore, Caroline, Cecil, and Queen Anne's—accounted for 53% of cases. The highest incidences of the disease in the state have been found in several counties on the Eastern Shore—Caroline, Kent, and Queen Anne's counties. In Worcester County, which includes Assateague Island, Lyme disease incidence doubled from 1990 to 1991.

Several epidemiologic studies show outdoor workers are at increased risk of clinical Lyme disease or infection with *Borrelia burgdorferi*, its causative agent.[2–5] In a 1988 study, outdoor workers who reported tick exposure on their primary jobs had a fivefold elevated risk of infection as measured by anti-*B. burgdorferi* antibody.[5] The occurrence of Lyme disease in outdoor workers may be a significant problem as an estimated

3.6 million US workers are employed in agriculture, hunting, forestry, and fishing.[6]

We report herein a study designed to assess the occupational risk of Lyme disease in workers at the Assateague Island State and National Seashore Parks in Maryland. Assateague Island is a barrier island located off the Eastern Shore of Maryland. The 37-mile-long island comprises sandy beaches, dune vegetation, pine woodland, shrub thicket, and salt marsh **(Figure).** It contains many wildlife species, such as sika deer, ponies, and mice, known to be hosts for the tick vector. Previous studies have demonstrated that Lyme disease is endemic to Assateague Island and adjacent areas of the Chincoteague National Wildlife Refuge, over the Virginia border directly to the south.[7] Secondary aims of our study were to determine the level of compliance with recommended preventive behavior and the effectiveness of such behavior for preventing Lyme disease.

Methods

Study population and design. The study involved pre- and post-season questionnaires and serosurveys before and after the summer of 1989. The questionnaires included information on demography, employment history, work assignment, participation in leisure activities, tick bite exposure, and Lyme disease symptomatology. All workers (n = 155) on Assateague Island were eligible to participate, but participation was voluntary. Employees were given a presentation on Lyme disease and an overview of the study goals and procedures. A total of 99 subjects (64%) answered the initial questionnaire and had blood drawn for serological analysis in May and June 1989. Of the 99 participants, 86 (87%) took part in the second phase of the study in August and October 1989, which included a second questionnaire and blood sample. The 13 subjects who did not participate in the second screening probably left employment prior to completion of the study.

Figure. Assateague is a 37-mile-long barrier island with sandy beaches, dune vegetation, pine woodland, shrub thicket, and salt marsh.

Laboratory analysis. Serum samples were sent to the state Department of Health and Mental Hygiene laboratory in Baltimore for analysis. The sera were analyzed for anti-*B. burgdorferi* IgM and IgG antibodies (Whittaker Bioproducts, Frederick, Maryland) by enzyme-linked immunosorbent assay (ELISA). A positive result was defined by the laboratory as an ELISA optical density ≥ 1.0.

Data analysis. Data were analyzed with Epi Info version 5.0 and included detailed frequencies, contingency table analysis, and stratified analysis.[8]

Results

Of the 86 subjects who participated in both phases of the study, 25 (29%) were park rangers and 11 (13%) were maintenance workers involved in facilities and equipment management. The remaining subjects represented a large number of job titles, including biologists, lifeguards, naturalists, secretaries, and sewage treatment plant operators. Most subjects were high-risk outdoor workers. Thirty-two (37%) spent all their time outdoors, 19 (22%) spent over 75% of their time outdoors, and 14 (16%) spent at least half of their work hours outdoors. Forty-three subjects (50%) were seasonal employees, 32 (37%) were permanent, and the remainder unspecified. Over two-thirds were employed at Assateague Island for one year or more, and one-quarter were employed for five or more years. Subjects conducted their outdoor occupational and leisure activities in a variety of habitats **(Table 1).**

Fifty-seven subjects (66%) reported ticks attached to their skin during the study period. Of these, 46 (81%) noted one to 10 tick bites, seven (13%) noted 11 to 30 tick bites, and four (8%) noted more than 30 tick bites during the summer season.

Workers reported a wide variety of preventive behaviors **(Table 2).** Workers were more likely to use preventive behaviors at work. However, a significant minority of workers—and for some behaviors, a majority—did not report using preventive strategies. For example, only 15% reported tucking their pants into their socks at work, and only 59% reported applying insect repellant to clothing.

No worker had evidence of current or past infection with *B. burgdorferi*, and no worker seroconverted during the course of the study. All IgG and IgM serologic tests were negative for antibody to *B. burgdorferi*. In addition, no worker developed

clinical illness suggestive of Lyme disease during the study period.

Discussion

This study sampled a group of employees working on Assateague Island, an area endemic for Lyme disease. Workers reported frequent tick bites, but there was no evidence of current or past infection with *B. burgdorferi* and no cases of clinical Lyme disease during the study period from May through October 1989. Notably, while self-reported prevention activities were common, they were not universal even in this population at high risk for tick bites.

Prior studies report seroprevalences ranging from 6% to 34%.[2–6] There are several possible reasons for the low risk of infection observed in the current study. Assateague Island may have a lower density of ticks and a lower prevalence of infection of *Ixodes dammini* by *B. burgdorferi* than other endemic areas. Detailed information on tick density and tick infection on Assateague Island is not available. However, the island has habitat and wildlife characteristic of other endemic areas. Sika deer *(Cervus nippon)*, white-footed mice *(Peromyscus leukopus)*, and *I. dammini* have been identified on the island.

An alternative explanation for the lack of *B. burgdorferi* infection is that knowledge of Lyme disease and awareness of tick bites is high on the island, and preventive activities adequately protect the workers. It should be noted that there were no significant differences in preventive behavior of workers who did and did not report tick bites, suggesting that preventive behavior interfered with Lyme disease transmission but did not prevent tick bites. This suggests that tick removal within 48 hours following tick attachment is critical. It is thought that spirochete transmission does not occur for at least 48 hours after attachment.[9] Over 90% of workers reported regular skin checks for ticks.

Preventive behavior has been studied in several other populations of outdoor workers. For example, compared with high-risk outdoor workers

Table 2. Self-reported tick-bite preventive activities at work and leisure activities by 86 outdoor workers on Assateague Island (summer 1989)

Preventive activity	At work % reporting use	At leisure % reporting use
Wear light-colored clothes	13	28
Wear long pants	71	29
Tuck pants into socks	15	10
Wear long-sleeved shirt	20	14
Wears hats	40	19
Apply repellant to skin	73	44
Apply repellant to clothes	59	37
Use permethrin on clothes	5	0

in New Jersey, where 5.7% of workers had serologic evidence of past infection with *B. burgdorferi*,[10] workers on Assateague Island practiced preventive behaviors more often. In accordance with prior research,[5,6] the data support tick bite prevention strategies decreasing the risk of Lyme disease.

OCCUPATIONAL PHYSICIAN — MEDICAL DIRECTOR

Weirton Steel, a prosperous, employee-owned integrated steel company with leadership positions in tin plate and sheet steel products seeks an Occupational Physician — Medical Director with diverse primary care and public health talents. We offer a competitive compensation package. This position also offers a comprehensive relocation assistance plan. Medical responsibilities include direction and hands-on care in a busy clinic, direction of a large and well equipped corporate rehabilitation facility, supervision of state-of-the-art audiometry and optometry services, supervision of medical aspects of substance abuse and rehabilitation and frequent interaction with the local medical community to ensure that our workforce receives best available cost-effective care. The Physician—Director will also bring a public health perspective.

The successful candidate should be board eligible or certified in one or more of the following specialty areas: internal medicine, occupational medicine, family practice, or emergency medicine. Experience in occupational medicine is required. To apply, please send your resume and salary requirements in full confidence to:

Jeffrey D. Robinson
Corporate Recruiting & Staffing Manager
Weirton Steel Corporation
400 Three Springs Drive
Weirton, WV 26062

The residents' computer bulletin board system: Results of a 23-month pilot study

Ralph P. Woodward, M.D. and David I. Zolet, M.D.

ABSTRACT: *The Residents' Computer Bulletin Board System (RBBS) originated as an offshoot of a research project designed at a 1988 meeting of Baltimore's chief medical residents. Beginning on March 1, 1989, RBBS offered electronic mail, bulletins, file transfers, newsletters, and data collections to physicians-in-training. It operated for 695 days before ResNet, sponsored by the American College of Physicians, superseded it . This report details how medical students, residents, and fellows used this electronic means of communication and offers some conclusions about the elements that future computerized bulletin board systems should have to succeed.*

From the Franklin Square Hospital Center where Dr. Woodward was chief resident at the time of the study and Dr. Zolet is associate program director, Internal Medicine Residency Program.
Reprints: *David I. Zolet, M.D., Franklin Square Hospital Center, Department of Medicine, 9000 Franklin Square Dr., Baltimore, MD 21237.*

In August 1988, chief residents from eight of Baltimore's internal medicine residency programs met to discuss the design of a collaborative research project sponsored by the Associates of the Maryland Chapter of the American College of Physicians (ACP). The Residents' Computer Bulletin Board System (RBBS) was originally implemented to support this city-wide research project by remote collection and analysis of data from participating institutions and by subsequent distribution of results via computer modem.

It was apparent from the start that this research project would consume only a small portion of the computer's available resources. It was equally apparent that the RBBS could provide services beyond those required to support the ACP associates' project.

The RBBS, like other computer-based bulletin board systems, allowed users with similar interests, medical students, residents, and fellows, to exchange information and ideas primarily in the form of messages and files. Specific services offered by the RBBS included electronic mail, bulletins, file transfers, newsletters, and data collection. Electronic mail became especially and increasingly popular with a small group of Baltimore area medical residents.

The first version of the RBBS ran on donated equipment using a shareware version of *WILDCAT!* (Mustang Software, Bakersfield, California).

Setup and testing of the prototype bulletin board was completed in February 1989, and the RBBS took its first call on March 1, 1989.

Continuous growth in the use of RBBS prompted an upgrade in software, in late March 1989, to a commercial version of *WILDCAT!* that provided enhanced security and additional services. A desire to expand the service area and collect data on nationwide patterns of residents' computer bulletin board use lead to the installation of a toll-free "800" line in September 1989, thus establishing the first toll-free electronic bulletin board system devoted exclusively to physicians-in-training.

Installation of the toll-free line and subsequent announcements of the RBBS in several medical journals[1–3] was followed by a rapid increase in usership **(Figure 1).** After 23 months of regular service, the "800" line was discontinued on January 25, 1991, in anticipation of ACP's successor to the RBBS—ResNet, a major initiative introduced at the 1991 ACP annual session in New Orleans. In this report, we present data that may prove useful in improving the efficiency and effectiveness of electronic communications used by physicians-in-training.

Methods

Hardware for the RBBS included a 12.5 MHz 80286 IBM compatible with 1.5 MB RAM, a 42 MB fixed disk, and a 2400 BPS internal modem supporting a single telephone line. It operated on the DOS 3.2 system. We used *WILDCAT!* Version 2 (Mustang Software, Bakersfield, California), single-line version.

We limited membership in RBBS to medical students, residents, and fellows who completed a questionnaire at the time of their first sign-on. All users were required to provide a current residency program or medical school and a telephone number for verification of in-training status.

The RBBS provided information in the form of messages and files. A total of 176 program/data files were available. Messages, usually short enough to read on-line, could also be printed out for review later. Files, larger collections of information in either text or software program form, had to be transferred or downloaded to the user's machine to be run later. Unless marked private, messages were "posted" on the bulletin board for all users to read, thus forming an important shared source of information, which ranged from the policies governing residencies to technical problems with computer operations. Hierarchical user and file library levels provided security.

The RBBS operated from 5:00 pm to 8:00 am, Monday through Friday, and continuously during the weekend.

Results

Announcements regarding the RBBS were listed in the notice sections of the *New England Journal of Medicine,* the *Journal of the American Medical Association,* and the *Annals of Internal Medicine.*[1–3] Letters were sent to the deans of all medical schools and to selected chief medical residents. **Figure 1** shows the increase in user census from March 1, 1989, to a peak of 269 users on January 24, 1991. Growth entered an exponential phase corresponding with the appearance of announcements for the RBBS.

Forty-two percent of callers learned of the RBBS through the announcements in medical journals described above.[1–3] The remainder identified other sources such as a school newsletter, another bulletin board system, or word of mouth. When users were asked if they would pay long-distance charges if required, 54% answered negatively. Although callers used a variety of hardware, IBM, IBM compatibles (75%), and the Apple Macintosh (19%) were clearly the machines most commonly used.

During its 695 days of operation, the RBBS logged 4,516 calls from 269 medical students, residents, and fellows. An additional 52 callers did not meet the criteria for physician-in-training status, and another 12 callers were duplicate accounts.

One hundred seventy-seven callers (66%) completed the new-user questionnaire. Sixty-five percent of respondents were residents, while 25% identified themselves as students. Sixty-two percent of respondents were currently in internal medicine or intended to pursue an internal medicine residency, 9% were in family practice, and the remainder were from a variety of other residencies.

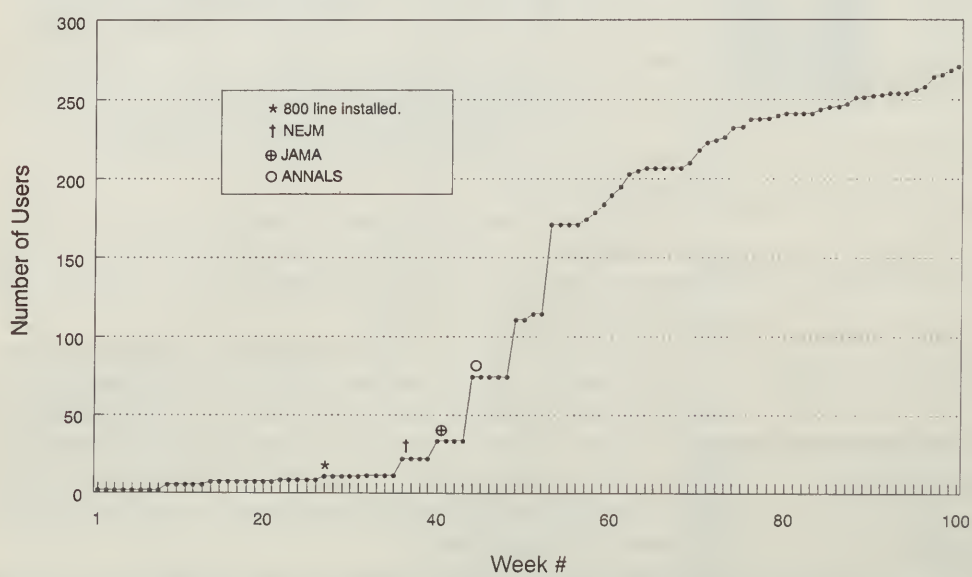

Figure 1. Cumulative growth in user census. Appearance of notices in major journals is indicated. Time period: March 1, 1989, to January 25, 1991.

Electronic mail, the most popular of the services offered by RBBS, provided an easy means of communication among residents. Communications most frequently dealt with curricular policies and procedures in different program settings, allowing for the exchange of ideas to improve educational and operational policies of residency programs.

The system's hard drive did not have sufficient storage space to allow us to track the activities of individual callers. The system did, however, track cumulative activity in the various areas of the bulletin board, so that a general representation of user activity could be constructed. The average number of calls per user was 17. Approximately 12% (33) of RBBS callers made 76% (3,423) of the calls. Fifty-five percent of users made fewer than five calls (**Figure 2**). A typical call was 11 minutes long. Although calls were evenly distributed among the days of the week, the busiest hours of the day were 8:00 pm to midnight (44% of calls). After connecting with the system, users were automatically notified of any messages waiting in their "mailbox." After collecting the "mail," users typically perused other messages on the bulletin board, which they could select by addressee or by subject matter. Security measures protected private mail. If desired, callers could post a message on the bulletin board; new messages were posted during 31% of all calls.

Users could go to any other area of the bulletin board by selecting the desired area from an on-screen menu. During their initial calls, 100% of new users accessed bulletins, which were informative pieces posted by the systems operators; during repeat calls, 28% of established users accessed bulletins.

A visit to the files section resulted in a transfer during approximately 20% of all calls. Forty-eight percent of users downloaded a file during the operational life of the bulletin board system, while only 10% uploaded files. The most frequently downloaded files were utilities software (45%), address files for fellowship programs (36%), and self-instructional programs (19%). All files were public domain and shareware (that is, none were copyright protected). One hundred eleven callers (41%) did not participate in any file transfer.

Figure 3 shows use of the "800" line over the 497-day period of toll-free service (September 15, 1989, to January 25, 1991). The average number of calls per user decreased. Average call duration also decreased over time, resulting in a gradual decrease in total monthly costs. This occurred even as the number of registered users increased.

Discussion

Resources for subsidizing toll-free telephone access for physicians-in-training are limited, mandating thoughtful and efficient distribution of services. Education of users is an important first step in cost reduction. Thirteen percent of our callers signed-off by dropping the carrier rather than allowing the RBBS to log them off. While this was not a problem with the RBBS, some commercial services charge penalties for inappropriate log-offs. Additionally, nearly 5% of users opened second accounts when they forgot their passwords rather than reporting the problem to system operators. Higher speed modems (at least 2400 BPS) have become inexpensive enough that users should be encouraged to use them whenever their use does not incur a connect-rate penalty. For similar reasons, system operators should educate callers to use the most efficient transfer protocol offered by the host system in order to reduce file upload/download times. This usually means foregoing the simplicity of XMODEM and, in some instances, may require host operators to supply callers with appropriate transfer software.

Despite continuous growth in user census, there was a downward trend in monthly connect time. Overall, this was desirable since we were able to reach more users without the expected increase in operating expense. Both a decrease in the average number of calls per user and, more importantly, a shorter duration of the average call contributed to the reduction in monthly connect time (**Figure 3**). The decrease in call duration appeared to result from fewer file transfers and less browsing by users. Users should be encouraged to reduce connect time by reading and writing electronic mail off-line, and systems operators should construct menus that allow users to find what they need as quickly as possible. In some instances, it may be desirable to institute a graduated pay scale to discourage long connect times and too frequent calling.

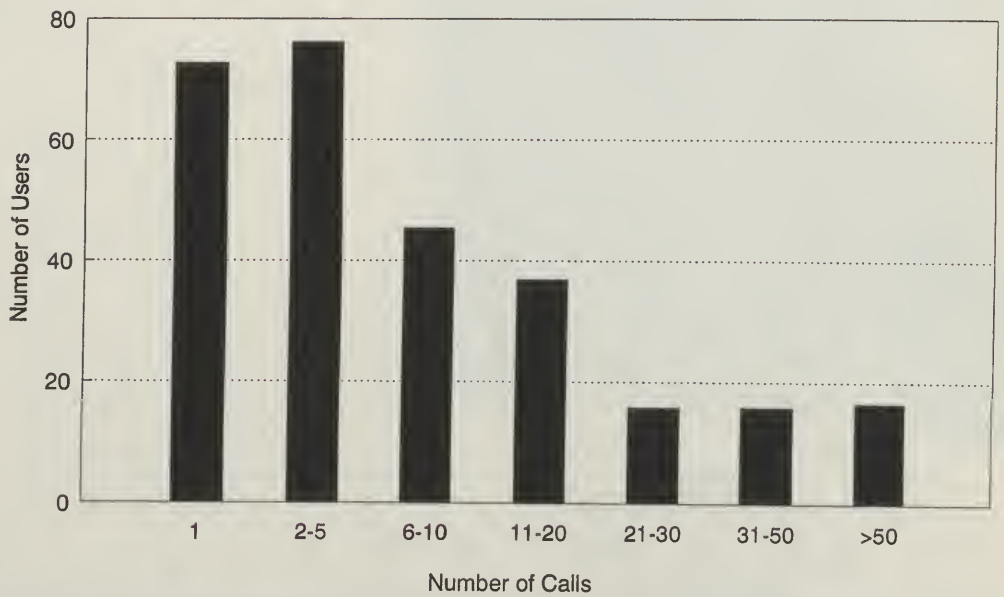

Figure 2. Frequency of user access to bulletin board.

Finally, since file transfers are time consuming and expensive, users should be given guidelines concerning the types of files that are appropriate for uploading.

We might postulate many reasons for the decreased use of the RBBS over time. First, the effect of the initial publicity may have worn off. Although the RBBS continued to add new users until termination, the rate at which new users joined, sharply decreased after the 60th week **(Figure 1).** A new set of announcements published at that time may have stimulated more growth during the second year of service.

Second, a large number of users had only one call to the system, and an equally large group had two to five calls to the system **(Figure 2).** The large pool of inactive and infrequent callers might suggest that the RBBS did not offer the kinds of services that interest residents or, possibly, many of these infrequent callers discovered the RBBS late in its life. Unfortunately, however, we have no time line that would place these callers in a chronologic sequence to confirm this possibility. Perhaps with a large number of users on a single telephone line system, frequent busy signals may have discouraged many interested users.

A third possible explanation for the decreased use of the RBBS centers around the issue of physician resistance to computer use. Attitude surveys have identified and categorized resistance along several lines, such as value conflicts, objections to change, and the need to undergo training to learn new skills. Investigators have found that a common source of resistance lies in the difference between the intuitive reasoning of the clinician, using qualitative information or "gut feelings" to formulate a clinical assessment, and the more rigid, quantitative, and objective input of discrete data required by available computerized "expert systems."[4–6]

Nevertheless, these surveys identify a generally positive attitude toward computerization among health care professionals, and among physicians in particular. These studies, however, have centered on the tasks of using computers for information and data retrieval and for clinical decision making. Such paradigms pit the computer against more time-honored reference sources, such as textbooks, print journals, and collegial consultation.

The RBBS, however, did not present the same dichotomy; it did not require a user to decide between two competing strategies for problem solving. Rather, the RBBS was a relatively easy-to-use, nearly passive gateway that provided access to information the user could not easily obtain except through computerized methods. The RBBS, therefore, did not represent a conflict between informational sources.

The true question becomes whether the information offered was of value or interest to users. The RBBS was, in a very real sense, a store, an information outlet, to which users could be attracted if the services and goods were of value. Huth has defined information that is of high value as being of high relevance, thoroughness, and efficiency with low cost.[7] Since RBBS met the requirement of low cost, we must consider whether inadequacy of its services and/or information caused the drop-off in use of the RBBS near the end of its operational life. As different physicians have different informational needs, ResNet and other means of electronic communication must be carefully tailored to meet the needs of physicians-in-training. Residents must define what constitutes the "useful information" that fits Huth's value equation.

In 1984, the Association of American Medical Colleges wrote in "Physicians for the Twenty-First Century:" "Medical schools should designate an academic unit for institutional leadership in the application of information sciences and computer technology to the general professional education of physicians and promote their effective use."[8] The services provided by bulletin board systems, such as the RBBS, clearly belong to this genre.[9] While much is made of some of the more dramatic areas of medical information sources (databases, graphics, expert systems), it should be understood that bulletin board systems provide support to all of these services through files, libraries, electronic publishing, electronic mail, data collection, bulletins, and newsletters.

Use of the bulletin board system is an easily learned skill that potentially provides access to a wealth of information in a relatively short time and at modest cost to the user. Users can access the bulletin board system at home and during leisure time, obviating

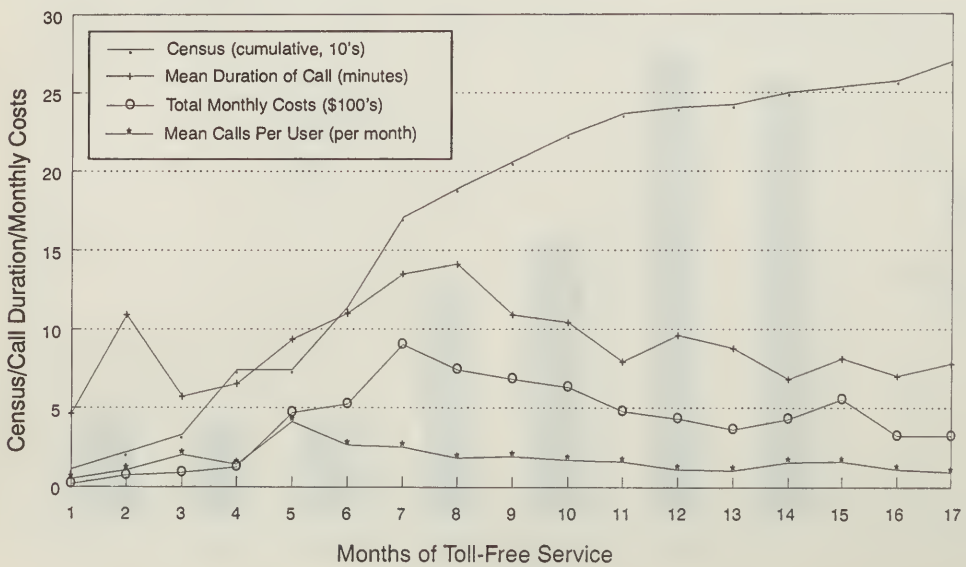

Figure 3. System statistics during period of toll-free operation. Time period: September 15, 1989, to January 25, 1991.

the concern that pressures on a busy resident preclude having time to go on-line. From this argument, we can expect that resistance to use of the bulletin board should be low and user activity high, provided the board allows access to the right information in a timely and cost efficient manner.

YOCON®
YOHIMBINE HCl

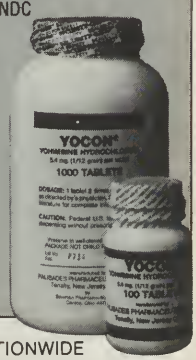
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatic. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and cartainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Body stalk deformity in a twin pregnancy: Case report and review

Scott A. Glasser, M.D.; Nayere N. Zaeri, M.D.; and Harvey Nisenbaum, M.D.

ABSTRACT: *Body stalk deformity is a variety of the limb-body wall complex (LBMC)—the rare, complicated, congenital process believed to result from early rupture of the amnion and vascular disruption. Here we report a case of this anomaly in a twin pregnancy and describe the prenatal ultrasound findings.*

Dr. Glasser is a radiologist with Diagnostic Radiology Associates, Ellicott City, Maryland. Dr. Zaeri is a pathologist and Dr. Nisenbaum is a radiologist at the Albert Einstein Medical Center, Philadelphia, Pennsylvania.

A twenty-seven-year-old female, gravida two, para two (both normal and uneventful), made an initial visit to the obstetrical clinic at 20 weeks of gestation. At this time, alphafetoprotein levels were elevated. Ultrasound evaluation identified a diamniotic twin pregnancy without a discernable size discrepancy between the two fetuses. However, the ultrasound detected a ventral abdominal defect in fetus "B" **(Figure 1).**

Seven weeks later on the patient's second visit to the clinic, physicians believed on physical examination that the patient had an incompetent cervix, and they contemplated a cerclage. A viability study performed at that time revealed femur lengths of fetus "B" measuring 44 mm and 46 mm compared with femur lengths of 50 mm measured from fetus "A." In addition, there was oligohydramnios of fetus "B" along with the obvious abdominal wall defect (thought at this time to contain both bowel and liver) **(Figure 2).** The thorax was small and the spine could not be adequately visualized due to scoliosis **(Figure 3).** Normal kidneys and bladder were never identified. A normal cord was not present in fetus "B," although color Doppler did demonstrate flow from the placenta into the adherent extruded contents of the fetal abdomen via a short pedicle **(Figure 4).**

On the day following the ultrasound examination, the patient experienced contractions and ruptured membranes of the healthy fetus. An emergency cesarian section was performed with the premature normal fetus going to the neonatal intensive care unit, while the malformed fetus, fetus "B," born with an Apgar score of two, succumbed shortly after birth.

A postmortem examination of the fetus along with a radiograph documented the complex abnormalities present **(Figure 5).** The autopsy described a 490-gram male with 46 XYY karyotype, demonstrating a slightly right-sided abdominal wall defect with exteriorization of the liver,

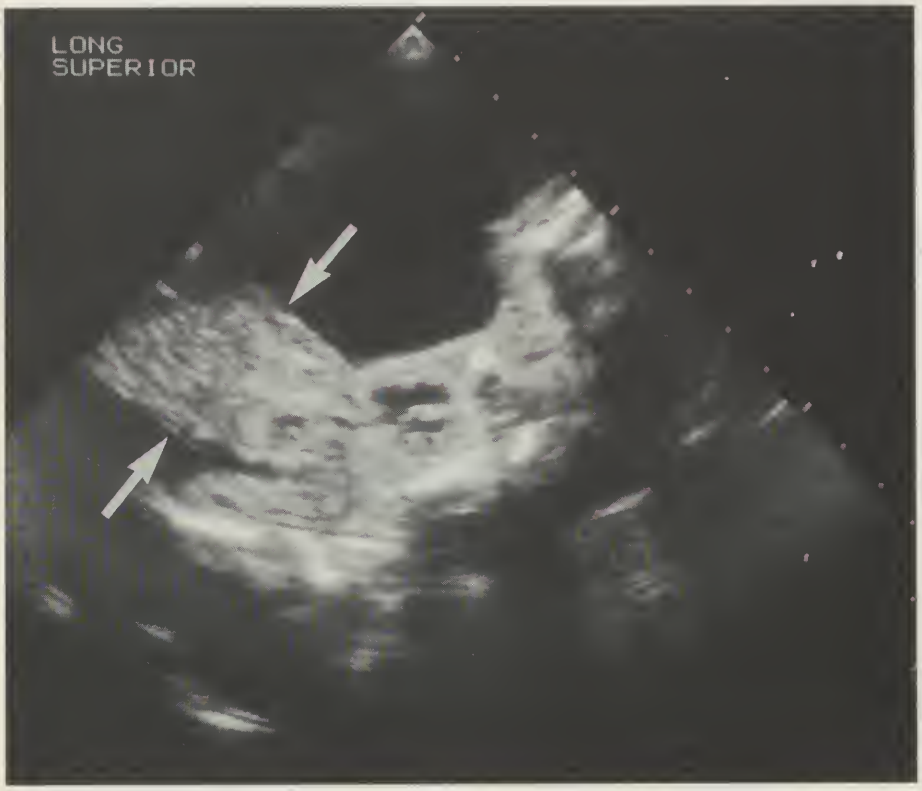

Figure 1. Arrows demonstrate the ventral abdominal wall defect seen during the first ultrasound examination at 21 weeks.

intestines, and spleen. Associated skeletal deformities included a severe scoliosis, flexion deformities of the lower limbs, and a shortened right leg. No amniotic bands were found. The umbilical cord was not formed; a single left-sided umbilical artery and umbilical vein coursed through a short segment of membranes. There appeared to be continuity of the amnion with the abdominal wall. Associated internal defects included severe, bilateral pulmonary hypoplasia with absence of normal lobulation, absence of the diaphragm, and absence of the right testicle. The left testicle was intra-abdominal. A small right-sided kidney was present along with small and disfigured adrenals. The bowel was malrotated and displaced. No abnormalities of either the heart or brain were identified **(Figure 6).**

Figure 2. The abdominal wall defect seen at 28 weeks was thought to contain liver as well as bowel.

Discussion

The limb-body wall complex (LBWC) malformation is a complex one whose mechanism is not fully understood. Indeed, a great deal of confusion exists concerning the terminology of LBWC. Synonyms of this entity include cyllosomus, pleurosomas, early amnion rupture sequence, and amniotic adhesion malformation syndrome.[1] An absent umbilical cord with direct adherence of the fetus to the chorion distinguishes the body stalk deformity as a variety of the LBWC. This is probably the entity that occurred in this case. Renal agenesis and single lower limb absence is termed sirenomelia.[2,3] Amniotic band syndrome, seen with the absence of a single limb segment, may actually be a less severe form of the LBWC spectrum.

Van Allen et al, in a study involving 25 cases of LBWC, demonstrated evidence to support the hypothesis that vascular disruption at four to six weeks gestation causes incomplete development of embryonic tissue secondary to hemorrhagic necrosis and anoxia.[4] This may lead to amniotic rupture and adhesion of the fetus to the amnion, as well as persistence of the extraembryonic coelum.[4,5] In addition, amniotic bands may cause extremity defects such as limb deficiency and amputation.[5,6]

The resultant abnormalities are protean and may include neural tube defects, scoliosis, limb anomalies, abdominal wall defects, facial clefts, hypoplastic diaphragmatic and paraspinal musculature, lung and cardiac defects, as well as intestinal malrotation.[2,4,5–8] Not surprisingly,

Figure 3. Scoliosis can be seen on the left-hand panel; while on the right, the abdominal defect is again visualized.

considering the propensity toward neural tube defects such as anencephaly, spina bifida, spinal dysraphism, and myelomeningocele, elevated alphafetoprotein levels have been reported previously in LBWC.[9,10] While being nonspecific, elevated alphafetoprotein levels found together with the ultrasound finding of an abdominal wall defect should prompt the examining physician to search for the sonographic clues that may help distinguish the certainly lethal entity of LBWC from the less catastrophic lesions of omphalocele and gastroschisis. However, because of the large number of abnormalities associated with the former, the physician may have extreme difficulty separating LBWC from omphalocele.

The sonograph in LBWC may include a multitude of findings (**Table**), but among them, the body wall defect (98%), limb defects (95%), amnion adherence to the body wall defect (85%), and scoliosis (77%) have been reported most consistently.[7–10] It may be difficult to visualize many of these abnormalities secondary to the presence of oligohydramnios.

Table. Potential sonographic findings in limb-body wall complex

Body wall defect	Abnormal tethering of the fetus to the chorionic plate
Limb defects	Short umbilical cord
Amnion adherence to the body wall defect	Midline facial clefts
Scoliosis	Exencephaly
Oligohydramnios	Spinal dysraphism
Complex mass anterior or lateral to a narrowed fetal trunk	Hydrocephalus (perhaps secondary to Arnold-Chiari)
	Renal agenesis

Although none of the 25 cases reported in the Van Allen study were associated with a twin pregnancy, an increased incidence of LBWC in monozygotic twins has been reported, especially in those cases associated with amniotic bands and in those cases thought to represent body stalk deformity.[11] This case, which we believe is the body stalk deformity and falls within the spectrum of LBWC anomaly in a twin pregnancy, represents an example of how the sonographic findings of short femur length, oligohydramnios, abdominal wall defect, scoliosis, and short or absent umbilical cord, together with an elevated alphafetoprotein level, led to the immediate clinical consideration of this extremely lethal entity.

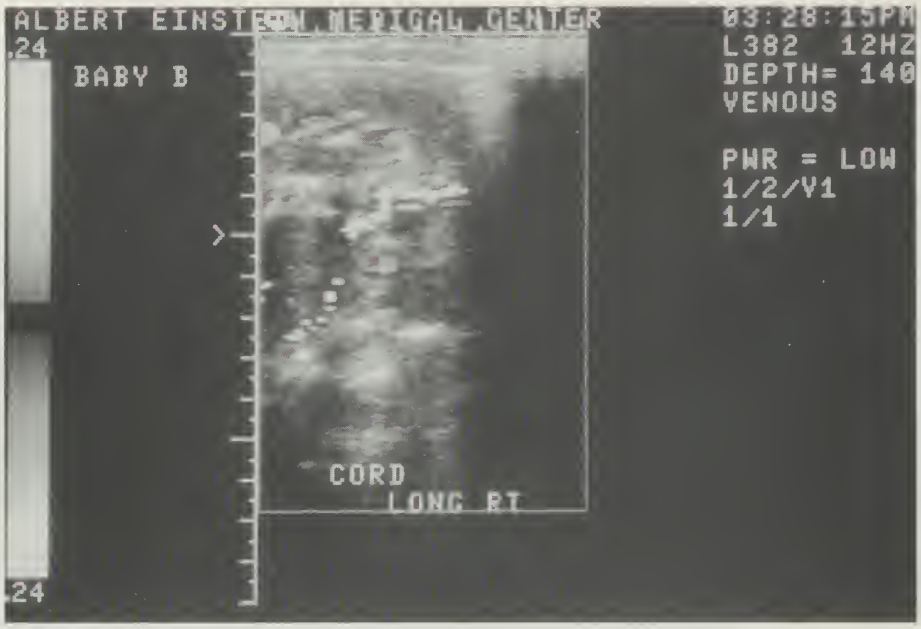

Figure 4. Color Doppler images demonstrate the abnormal appearance of the cord. No umbilical cord, per se, was ever identified, but rather a single artery and vein were seen at autopsy to course through a short segment of membranes.

Figure 5. Postmortem radiograph demonstrates the severe scoliosis, abdominal defect, and short right femur (arrow). There are also clubbed feet.

Figure 6. Pictures obtained at autopsy—anterior view. Note the abnormal appearance of the cord as well as the herniated liver, spleen, and intestine.

A brief history and discussion of certain mycotic infections and their importance to physicians*

Theodore E. Woodward, M.D.

ABSTRACT: *Mycotic infections are common and their incidence is increasing. They can be difficult to distinguish from other infections, particularly tuberculosis, but there are numerous clinical clues that can help suggest the presence of systemic mycoses. Histoplasma skin tests, serologic tests, and agent isolation can aid in the confirmation of a fungal infection. Clinical considerations must be put in the proper perspective before a definitive treatment is proposed. Specific chemotherapy is often curative.*

From the Department of Medicine, University of Maryland, where Dr. Woodward is professor of medicine emeritus, and the Baltimore Vereran's Administration Medical Center.

**Excerpts from a lecture presented at the Gorgas Army Hospital, Panama, on August 23, 1982.*

The incidence of mycotic diseases has increased markedly during the last several decades, and, for that reason, they are important to the practicing physician.[1] Medical advances that have accrued from the development of anti-microbial, anti-neoplastic, and anti-inflammatory drugs (steroids) have greatly reduced morbidity and mortality from many illnesses, including mycotic infections. Host defense mechanisms, however, have been altered in many of these patients, occasionally allowing tissue invasion by fungi. Thus, mycoses often occur in patients already ill with serious disease or in those under treatment. This large pool of patients, added to the group with primary mycoses, has made fungal infections prominent in the clinical category of obscure fevers.

When physicians of my age attended medical school, common teaching was that fungi were molds that grew on old bread and cheese; clinical expression in patients was supposedly rare. As a graduate of the University of Maryland School of Medicine, my indoctrination was a little broader because Dr. Samuel T. Darling graduated from Maryland's affiliate, the College of Physicians and Surgeons, in 1903. Always interested in pathology and the use of the microscope, Darling joined the Public Health Service after several years of clinical and pathologic training in Baltimore. He was subsequently assigned to Panama for work at the Ancon Hospital[2] (now Gorgas Memorial Hospital) (**Figure 1**).

Many laborers involved in the extensive work of building the Panama Canal suffered from malaria, yellow fever, and dysentery—disorders that

Figure 1. Samuel T. Darling, shown while in Panama. (Reprinted from *Journal of the Alumni Association of the College of Physicians and Surgeons* 1907; 9:97–102.)

exacted a tremendous toll. Darling's pioneer medical observation was first made in Panama in 1905 through his clinical and pathologic examinations of three canal laborers—two Martinicans and one Chinese—whose clinical illness resembled tuberculosis manifested by fever, weight loss, adenopathy, and hepatosplenomegaly. Postmortem revealed chromatin-like bodies in histiocytes (now called macrophages) of lung, hepatic, splenic, and lymph node tissues. The pigmented bodies resembled plasmodia with a surrounding halo that prompted the name *Histoplasma capsulatum* (**Figure 2**). Darling published his work in 1906,[3–5] and the disease soon became known as Darling's disease—a disseminated disorder that was almost uniformly fatal. Later, Darling became one of the nation's authorities on malaria and preventive medicine, holding high consultative positions with the World Health Organization. Unfortunately, he was killed tragically in an automobile accident while traveling on assignment in the Middle East in 1925.

In Baltimore, we are likewise proud that Thomas Gilchrist (**Figure 3**), professor of medicine in dermatology at Maryland and Hopkins, was the first to describe blastomycosis in 1894 (**Figure 4**).[6–8] Thus, two important fungal infections, histoplasmosis and blastomycosis, were originally described by physicians with Maryland ties.

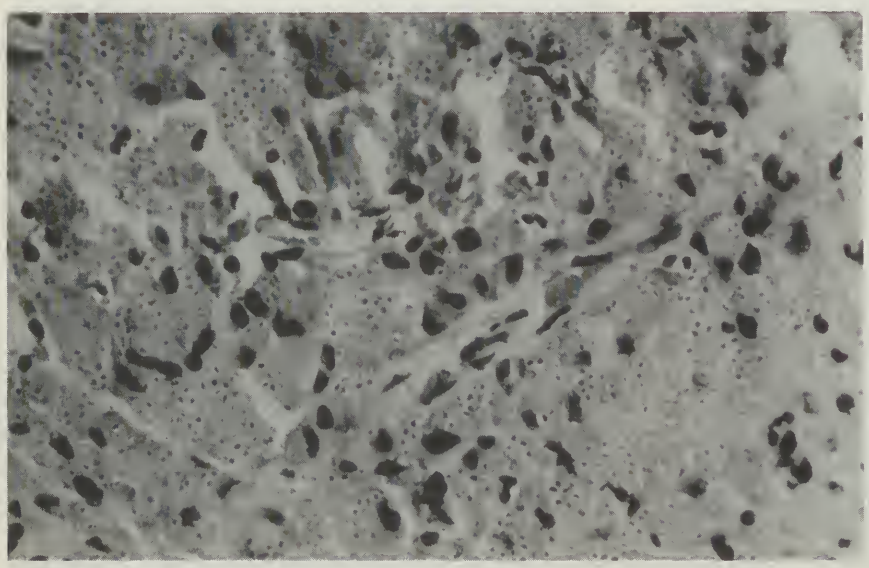

Figure 2. Photomicrograph of *H. capsulatum* in tissues.

Immunological considerations

Fungi often behave in a latent manner similar to tubercle bacilli. They are opportunists and emerge when the chemical or immunological environment is right to multiply and invade tissues. Many of us harbor *Candida albicans,* and those who have resided in rural areas probably carry a few viable *H. capsulatum. Candida* normally inhabit the intestine and skin; *H. capsulatum* probably reside within macrophages. Yet, one may not visibly suffer from *Candida* or histoplasma infestation and is unlikely to be injured by their presence unless infected with an overwhelming number of organisms or until host defenses are compromised.[9]

The person who pricks a finger with a rose thorn and subsequently develops sporotrichosis is an example of someone who has acquired a limited fungal infection due to an organism injected under the skin. Usually sporotrichosis is mild and can be effectively treated with iodine. Examples of a localized infection are shown in **Figures 5 and 6.**

Advances in medical practice help explain the increased incidence and dissemination of fungal infections. Medical progress has resulted in the development of corticosteroids and chemical agents designed to destroy neoplastic cells. Patients' immune defenses become compromised, leading to diminished leukocyte function and poor cellular immune reactions. Such patients often become defenseless. In spite of the proper use of antibiotics, steroids, and anti-cancer drugs, an environment can be created that makes it possible for fungi to invade organs and tissues they seldom damage under normal conditions. The disseminated illness reported by Darling is an excellent example.

Figure 3. T. Casper Gilchrist, who first described blastomycosis.

Systemic histoplasmosis of the type Darling described is rare, and it is likely that those who develop it today have diminished immunologic defenses.

Clinical clues to diagnosis of invasive systemic mycoses

Some of the clinical clues that Utz[10] stressed as useful for suggesting the presence of systemic mycoses are (a) obscure fever for several weeks; (b) elevated, small, crusted, draining skin lesions or persistent infections on the finger with lymphatic involvement; (c) persistent oral or laryngeal lesions with hoarseness; (d) persistent neurologic manifestations such as headache, visual or mental changes, or evidence of brain abscess with fever, localizing neurologic signs, and signs of increased intracranial pressure; (e) pneumonitis that persists in spite of antimicrobial treatment; (f) hepatosplenomegaly without anemia, leukocytosis, or cirrhosis in adults or children; (g) tissue evidence of granuloma in lung, lymph nodes, liver, prostate or skin; (h) persistently draining sinus tracts; and (i) unusual illness in patients with diabetes mellitus or lymphoma, or those undergoing prolonged corticosteroid, immunosuppressive, or radiation treatment.

Confirmation of a fungal infection

Histoplasmin skin test. Some of our current practical clinical problems relate to confirmation of the presence of a fungal infection. For example, many normal persons react strongly to histoplasmin injected intradermally since exposure to *H. capsulatum* is common in nature. As a boy raised in a small town, it was my Saturday morning chore to clean the chicken house. My skin continues to react strongly to histoplasmin. A positive reaction to this antigen does not necessarily indicate the presence of active illness. With histoplasmin, there are false positives and false negatives. Patients with active histoplasmosis may show negative skin results. Skin tests with fungal antigens are not reliable as confirmatory diagnostic aids.[1,10,11]

Serologic tests. A second method of confirming infectious disease is a serologic reaction test designed to detect specific antibodies, agglutinins, complement-fixing antibodies, precipitins, and immunochemical reactions. Available serologic diagnostic procedures are partially helpful but need improvement. When Dr. Charlotte Campbell (originally with the Walter Reed Army Institute of Research) and others developed antigens for *H. capsulatum* and other fungi, there was guarded optimism. Emphasis was placed on a rise in titer of complement-fixing antibodies or precipitins as indices of active infection. These serologic tests were shown to be occasionally useful but not wholly reliable; patients with active illness often failed to show antibody. Of all the serologic tests for the mycoses, precipitin, complement-fixation, and immunefluorescence reactions for the presence of antibody or antigen to *H. capsulatum* infections are the most helpful.

Figure 4. Original photomicrograph of *Blastomyces* described by Gilchrist. (Courtesy of Harry M. Robinson, Jr., M.D.)

Agent isolation. A third confirmatory laboratory test is isolation of the fungus from sputum, feces, spinal fluid, blood marrow, or individual tissues. It is not valid to conclude that the isolation of a fungus from the sputum, feces, or skin surface is indicative of specific causal illness, any more than the presence of a virus or a bacteria from the sputum or a mucus surface confirms that the tissue has been invaded by that agent. Isolation of fungi by culture takes time and must be interpreted properly in association with pertinent data.[1,10–12]

Agent identification. Every attempt should be made to visualize the causative fungi in tissues before the decision is made to administer an effective, but potentially toxic, drug such as amphotericin. It may be necessary to perform a skin, liver, or lung biopsy, or take surgical sections of other organs or draining sinus tracts in order to identify a specific organism by smear. Culture of such tissues on appropriate media should be performed simultaneously. Robert Koch stressed these principles years ago with his well-defined postulates.

Further means for demonstration of an agent in tissues include use of the electron microscope or immunochemical techniques demonstrating antigen or antibody in tissues. These measures are necessary to positively confirm, for example, that there is an aspergilloma of the lung, or that there is an actinomycotic infection of the pericardium **(Figures 7 and 8).**[1,10–13]

Principles of treatment

After clinical confirmation of systemic mycosis, the next problem is definitive treatment. The question arises whether a drug such as amphotericin, with its potent nephrotoxic side effects, or ketoconazole, which causes gastrointestinal abnormalities and interferes with hepatic drug metabolism, should be used, or whether the fungus infection will be self-limiting. Some mycoses may resolve spontaneously, such as the aerosolized sporadic type of pulmonary histoplasmosis or the allergic type of aspergillosis.[1,11–16] The thoughtful physician puts all considerations into proper perspective and makes a decision based on clinical factors.

In systemic mycoses with localized necrotic foci such as pulmonary histoplasmosis or actinomycosis, prolonged amphotericin B, 5-flurocytocine treatment, or other antibiotics may be necessary.[14–18] Ketoconazole is the drug of choice for nonmeningeal, non-life-threatening localized or disseminated histoplasmosis.[17–20] Ketoconazole, however, penetrates poorly into the cerebrospinal fluid; hence, amphotericin B is the drug of choice for histoplasma meningitis and all patients seriously ill with this disease.

Changing medical perceptions of fungal diseases

Knowledge of clinical data pertinent to the incidence and clinical importance of the mycoses has evolved slowly. Hamman and Wainwright listed the causes of obscure fevers in a

Figure 5. Sporotrichosis. Individual lesions along the lymphatics on hand and forearm. Satisfactory response with iodine treatment. (Courtesy of Robert T. Parker, M.D.)

Figure 6. Extensive lesion of sporotrichosis on forearm of 13-year-old boy. Confirmed by biopsy taken from the periphery of the lesion.

Figure 7. Fungus ball lesion in apex of lung caused by aspergilli at site of old, healed tuberculosis.

classic paper published in 1936.[21] Some of the diseases are familiar to today's physicians but fungal diseases were not included. In 1961, Petersdorf and Beeson published the findings on 100 selected patients with fever of unknown origin observed in the area of Yale-New Haven.[22] In this excellent article on obscure fever, fungal diseases were still not yet prominent. In 1965, however, Dr. Morton Rapoport and I collected retrospective clinical data on patients with granulomatous hepatitis.[23] The **Table** shows some of the medical conditions and infectious agents associated with granulomatous hepatitis found in the University of Maryland medical records system. There was no attempt to determine the incidence of specific cases, but various fungal diseases were prominently represented. Although hepatic biopsy is not an innocuous procedure, the liver is often a useful organ from which to obtain tissue for confirmation of the presence of certain fungi.

Table. Causes of granulomatous hepatitis

Infectious	Hypersensitivity	Other
Bacterial		Wegener's
Mycobacterial		Rheumatoid arthritis
Tularemia		Sarcoidosis
Brucellosis		Hodgkin's disease
Melioidosis		
Syphilis		
Rickettsial		
Q fever		
Fungal		
Histoplasmosis		
Coccidioidomycosis		
Actinomycosis		
Nocardiosis		

Example of a specific diagnostic problem

A white male, aged 49, presented himself with obscure fever that had persisted for over a year. He was ambulatory, but weak and tired easily. He had fever and sweating and appeared "walking sick." His wife gave helpful information when she said, "You know, he's better when he takes tetracycline." While one generally avoids giving antibiotics blindly, note how this statement was prophetic!

Pulmonary rales were heard in the lower right lung base, and there was mild cardiomegaly, tachycardia, and hypotension. A pericardial friction rub was heard intermittently. The chest roentgenogram showed slight cardiomegaly and a dense shadow in the right lower lung which intermittently appeared and disappeared during a year's observation. Whether the clearing occurred spontaneously or as a result of tetracycline treatment is unclear. A decision was made to perform an exploratory thoracotomy of the right side. The preoperative diagnosis was either tuberculosis or a fungal infection. Biopsy specimens of the lung and inflammatory tissue in the mediastinum and pericardium were obtained with the right-sided approach.

Figure 8. Aspergillosis. Mature columnar fruited head of *Aspergillus fumigatus.* (Courtesy of A.G. Smith)

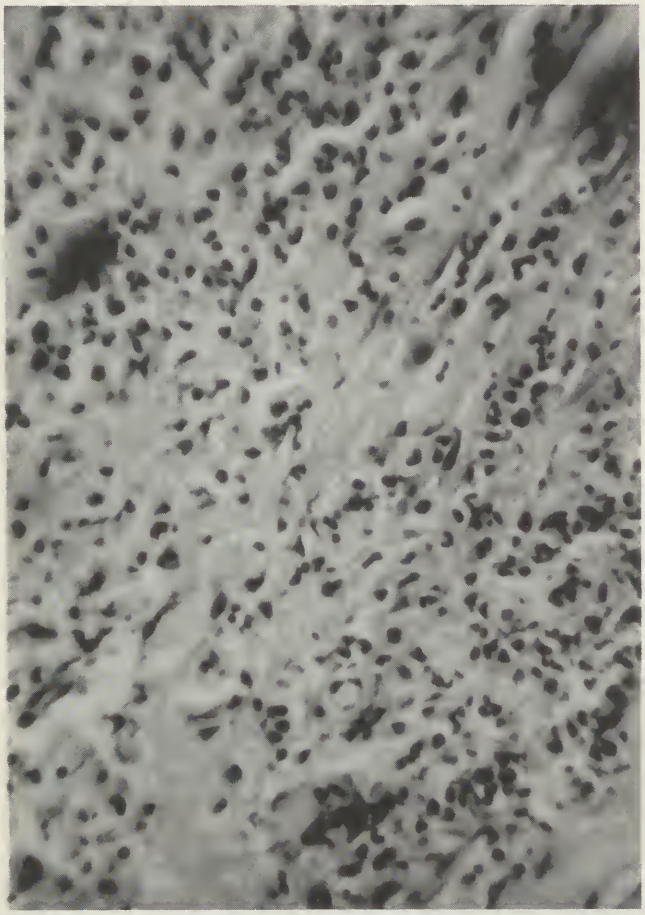

Figure 9. Actinomycosis. Photomicrograph of initial frozen biopsy specimen, patient showing inflammatory reaction principally of polymorphonuclear leukocytes and no granuloma formation.

Figure 9 is the photomicrograph of a lung specimen with inflammatory cells that are mostly polymorphonuclear leukocytes. A number of frozen sections examined at the time of surgery failed to identify a specific agent or lesion. It appeared that the purpose of the thoracotomy had not been accomplished. For several days, no specific agent was identified by culture of all appropriate media; examination of formalin-embedded sections showed no granulomata. The pathologist continued his search; after several weeks and examination of many microscopic sections, he reported enthusiastically that an agent had been identified. The ray fungus of actinomycosis (**Figure 10**) involved the lung, mediastinum, and pericardium. Without multiple sectioning, the diagnosis would have eluded us.

Geographic distribution of histoplasmosis and blastomycosis in the United States

Shown in **Figure 11** is an older map of the distribution of histoplasmosis and blastomycosis in the United States.[7–8] Maryland is on the edge of the blastomycosis belt (which centers in Kentucky, Tennessee, and surrounding states) and of the histoplasmosis belt. Histoplasmosis infection occurs commonly in those states bordering the Mississippi River and is said to have spread to the eastern states via prevailing winds. Overall, the geographic areas of incidence of blastomycosis and histoplasmosis are similar. Informative data on the incidence of histoplasmosis in Maryland and vicinity have been collected and published by Chase.[24]

Conclusion

Mycoses are common and here to stay. Physicians must be aware of their presence and learn to distinguish them from other infections with similar clinical manifestations, particularly tuberculosis. The lungs are the most commonly involved organ since many of the human mycoses are contracted by aerosol exposure. Acute, subacute, and chronic forms of pulmonary fungal infection occur. The most reliable means of confirmation of a mycotic infection is by biopsy of tissue and identification of the agent by smear and culture. Specific chemotherapy is often curative. In 1982 [and in 1993], as Samuel T. Darling said in 1907, "don't let this disorder catch you napping."

Imaging Case of the Month

CASE ONE. This 53-year-old white female was awakened in the early morning with diffuse upper abdominal pain, worse in the right upper quadrant, exacerbated by movement, and radiating to the back, followed by nausea and nonbilious vomiting. She also noted aching of her feet. When the pain persisted over 24 hours, she came to the hospital. Past history was notable for peptic ulcer disease and gallstones. She had had a similar attack of pain two years earlier. On physical examination, the abdomen was diffusely tender with guarding in the right upper quadrant. The white blood count (WBC) was 9000, hematocrit (Hct) was 36%, and a liver function test (LFT) and urine analysis (UA) were normal. The patient was afebrile on admission to the emergency room.

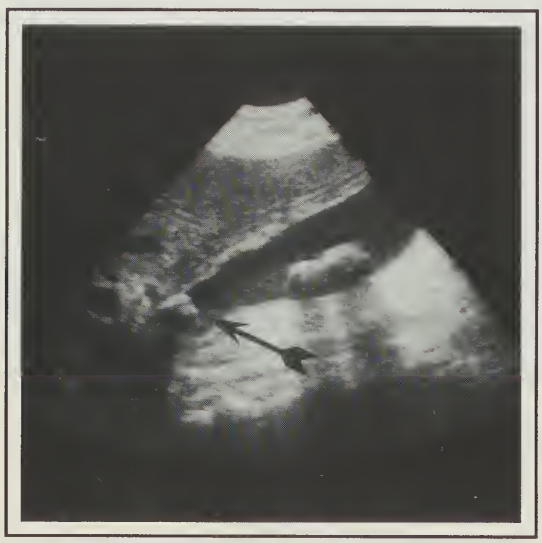

Figure 1A.

Figure 1C.

Figure 1B.

Figure 1D.

CASE TWO. This 54-year-old white female came to the emergency room with poorly localized upper abdominal pain, which had increased over four days and was associated with increasing nausea but no vomiting. Past history was notable for multiparity. On physician examination, the upper abdomen was tender, with guarding in the right upper quadrant. Her temperature was 100.2 F^{o}, total bilirubin was 3.1 (direct, 2.0; indirect, 1.2), WBC was 10,000, and UA was normal.

Acute cholecystitis

Case one. Ultrasound shows cholelithiasis with one stone apparently impacted in the neck of the gallbladder (long arrow, **Figure 1A**). The technetium 99m with imidodiacetic acid (IDA) scan shows a "blush" (short arrow) in the liver adjacent to the gallbladder fossa on the first static image (**Figure 1B**). The gallbladder was not visualized at 25 minutes (**Figure 1C**) or after clearing of the tracer from the liver (**Figure 1D**).

Case two. Ultrasound (not illustrated) showed a dilated common bile duct and stones in the gallbladder. The initial phase of the IDA scan showed a similar pattern with an immediate hepatic parenchymal "blush" (arrow) adjacent to the gallbladder fossa (**Figure 2A**), but in the patient, there was prolonged retention of the tracer in the liver with nonvisualization of the bile ducts and bowel, consistent with high-grade, common duct obstruction (**Figure 2B**).

The imaging workup of acute cholecystitis usually begins with ultrasound. The sonogram provides information about the presence of stones, thickening (edema or fibrosis) of the gallbladder wall, size of the common bile duct, or abnormal fluid collections (abscesses). It also gives the radiologist the opportunity to see whether the tenderness is truly in the region of the gallbladder (sonographic Murphy sign). When stones, wall thickening, and a positive Murphy sign are present, ultrasound alone has a sensitivity of about 80% to 96% and a reported specificity as high as 94% for acute cholecystitis.[1–3] The presence of pericholecystic fluid increases the probability of acute cholecystitis, but it is not specific.

If the sonographic findings are not typical or do not match the clinical picture, nuclear hepatobiliary scanning with technetium 99m labeled with imidodiacetic acid (IDA) derivatives may be used to evaluate the patency of the cystic duct. Failure of radiotracer to enter the gallbladder predicts the surgical diagnosis of acute cholecystitis with a sensitivity and specificity of over 95%.[1] Hyperemia of the portion of the liver adjacent to the inflamed gallbladder can be seen in both of these cases as a "blush" of the hepatic parenchyma, which appears immediately, and may also be seen in the vascular flow phase of the study. This parenchymal blush may be so intense as to simulate gallbladder activity, but it is usually not continuous with the biliary tract and outlines the expected location of the gallbladder fossa.

A false positive scan may occur if stasis of bile in the gallbladder has developed due to prolonged fasting, parenteral nutrition, or alcoholism. This problem may be avoided by injecting sincalide (the active C-terminal octapeptide of cholecystokinin) to empty the gallbladder prior to the injection of the radiotracer. An alternative to sincalide is the injection of a small amount of morphine to contract the sphincter of Oddi and allow the increased pressure in the common bile duct to force some tracer into the gallbladder. Both techniques seem equally effective in reducing the false positive rate. False negative scans, though rare, occur in about 8% of cases of acalculous cholecystitis.[4] Acalculous cholecystitis occurs in 2% to 10% of all cholecystectomies.

Common bile duct obstruction may interfere with the diagnosis of acute cholecystitis by preventing excretion of tracer by the liver. Although a larger dose of the radiopharmaceutical is given in this situation, based on the bilirubin level, it may not be possible to obtain adequate excretion if the obstruction is acute and severe (**Case 2**). Ultrasound findings and secondary scintigraphic signs, such as the hepatic parenchymal blush, may be helpful in choosing appropriate therapy in this setting.

The relative costs of these studies should also be kept in mind. A nuclear hepatobiliary scan usually costs at least two or three times as much as an abdominal sonogram. This difference reflects the higher cost of gamma cameras and the longer time necessary to perform functional hepatobiliary examinations. Both studies should not be ordered simultaneously if ultrasound alone will answer the clinical question.

WORD ROUNDS

Bart Gershen, M.D.

Sic transit gloria mundi

The last of the Stuart monarchs was Queen Anne, who ruled England from 1702 to 1714. During her reign, Charles II of Spain died leaving no heir to his throne. King Louis XIV of France immediately proclaimed his grandson Philip to be the new King of Spain. This decree incensed the British government, however, which formed a Grand Alliance with the Dutch Republic, the Holy Roman Empire, Prussia, and Portugal. The alliance launched a 13-year war to unseat Philip V from his Spanish throne—which became known variously as the War of the Spanish Succession or Queen Anne's War. In North America, it was called the second French and Indian War.

Although the Duke of Marlborough, John Churchill (distinguished ancestor of Sir Winston Churchill), was conducting a superb military campaign against both France and Spain, there were many in England who were critical of his tactics and those of his patron, Queen Anne. One obscure man, however, rose passionately to their defense.

His name was Thomas. He lived in Bristol, was an accomplished seaman, and had acquired a surfeit of military ideology from his father who had been a Royalist cavalry officer. In addition, Thomas was a physician. Educated at both Oxford and Cambridge, he subsequently completed an apprenticeship under Dr. Thomas Sydenham, who also treated him for small pox at no extra charge.

Sydenham, of course, had described **Sydenham's chorea**—a neurologic disorder consisting of involuntary movements of the arms, trunk, and legs; gait disturbances; and dysarthria—usually detected in young women, and classically resulting from acute rheumatic fever. In 1944, Dr. T. Duckett Jones specified the essentials requisite for a clinical diagnosis of rheumatic fever, among which Sydenham's chorea was listed as a major criterion.[1]

Sydenham's chorea is also referred to as **St. Vitus's Dance.** Vitus was a Sicilian boy who had been martyred in 303 AD during the tyrannical anti-Christian persecutions of the Emperor Diocletian. Subsequently, the dead youth was elevated to sainthood, and statues were built to honor him in many cities throughout Europe. Then, during the 11th and 12th centuries, his worshipers began to develop very curious behavior. On St. Vitus's Feast Day, maniacal throngs of celebrants gathered to dance around his statues. These undulating dancers ultimately reached a frenzy of ecstasy and fainted or developed convulsive seizures. The reason for their grotesque conduct was never entirely explained, but St. Vitus and his dancing idolaters have become a metaphor for rheumatic chorea.

Chorea itself is borrowed directly from Latin and means 'dance'. It can be found in such words as **choreo**graphy and terpsi**chorean.**

Returning to our protagonist—in 1708, Thomas was engaged in an active general practice, but he could not remain passive while his

queen was being deprecated and his country threatened by an insolent Spanish adversary. So he outfitted a galleon, hired expert seamen, and began a three-year voyage that became the most successful pirate crusade in English history.

Sailing through Drake's Passage around Cape Horn, he plundered and sacked the Spanish cities of Ecuador and Chile. Then, after unprecedented success, he returned to England carrying a vast booty that he proceeded to share with his grateful monarch.

Eventually he returned to medical practice, his newfound wealth permitting a more leisurely pace, and a grateful nation affording an adequate supply of patients.

His full name was Thomas Dover (1660-1742). At one time, he was prominent in medicine for having developed a popular sedative consisting of 10% opium, 10% ipecac, and 80% lactose. It was known as **Dover's Powder.** Today, it is hardly remembered.

Queen Anne died in 1714, shortly after the Treaty of Utrecht. Her claim to posterity, as trifling as it was, forever obligated to a war which endured her name. Since she had no children, British rule passed to the German royal house of Hanover, and King George I, who spoke no word of English, became the next King of England. During World War I, King George V renamed the British imperial family "Windsor," in order to disassociate completely from his German heritage.

Queen Anne's Lace, a biennial plant in the parsley family, is not named for the above English monarch. Rather it is named for Anne of Bohemia, wife of King Richard II, who lived in the 14th century. This plant is actually a wild carrot with bitter, albeit edible, roots—which were once used as a mild diuretic. Its taxonomic designation, *Daucus carota,* is distinguished from the domestic carrot, which is *Daucus carota sativa.*

Now there is one fascinating addendum to the story of Dr. Thomas Dover.

In 1563, a Spanish explorer named Juan Fernandez had discovered three tiny volcanic islands in the South Pacific, approximately 400 miles west of Valparaiso, Chile. Fernandez claimed them for his government and had lived there for several years, stocking the area with domestic pigs and goats. Then he abandoned the islands, which still bear his name.

After he had gone, the islands remained uninhabited and were used mainly by local fisherman or by migrant seamen who stopped to replenish fresh water and food stores after rounding Cape Horn.

In 1704, a pirate ship made such a layover. Among the buccaneers was a Scottish sailor named Alexander Selkirk. Following a violent argument with his captain, Selkirk was forced to leave the ship, marooned indefinitely on Mas a Tierra, one of the three islets in the Juan Fernandez chain.

However, in 1709, Thomas Dover and his crew, responding to distress signals, discovered the deserted sailor, took him on board, and brought him back to England.

Shortly thereafter, based on Selkirk's tale, Daniel Defoe made him into a hero for all ages. He wrote *Robinson Crusoe.*

A Clinical Moment with Diabetes

The importance of early diabetic retinopathy detection

Doctor, I am 59 years old and was recently diagnosed as having diabetes. After my initial visit to my diabetes specialist, I was advised to make an appointment to see an ophthalmologist to see if diabetic changes in my retina were visible. I was surprised that there was a possibility that diabetes had already affected my eyes, since my vision is fine. Is it possible I could already have significant damage? If my ophthalmologist finds any problems, is there anything that can be done to prevent my losing vision?

Your doctor asked you to see your ophthalmologist to be absolutely certain that early changes in the retinal blood vessels had not occurred because of diabetes. These changes can be very subtle, and special techniques may be required to detect them. Many patients with adult onset (or Type II) diabetes have had the disease much longer than they think, and it is possible for significant diabetic retinopathy to be present in a newly-diagnosed patient. Some diabetic patients require treatment in spite of their not having symptoms.

Diabetic retinopathy is the leading cause of new cases of legal blindness among Americans between the ages of 20 and 74, and the American Academy of Ophthalmology has recently initiated a "Diabetes 2000" project in an effort to significantly reduce the effects of this disorder by the year 2000. Detection of diabetic retinopathy is the critical step in the management of the problem because early cases respond much better to therapy.

The retina is a thin membrane, shaped like a coffee cup, that lines the back of the eye like a film in a camera. It receives light waves and transmits visual messages to the brain. The retina contains blood vessels that are visible to a doctor using an ophthalmoscope. Most patients with diabetes ultimately develop abnormalities in their retinal blood vessels, and the likelihood of these changes increases with the duration of time a patient has had diabetes. Juvenile diabetics usually do not develop retinal changes for many years after they are diagnosed, but diabetic retinopathy can appear in adult-onset cases even before the diagnosis of diabetes is confirmed. Diabetic retinopathy is usually classified as either nonproliferative or proliferative. The former type of retinopathy is most common, and it affects visual acuity by causing a leakage of serum into the central retina. Even at its worst, this type of retinopathy does not cause total blindness, but can severely limit the ability to read, drive, and recognize friends. Proliferative retinopathy, on the other hand, can cause a profound loss of all vision because of severe hemorrhage or retinal detachment. This type of retinopathy is characterized by a proliferation (or growth) of fragile abnormal vessels upon the inner surface of the retina.

Fortunately, when treatment is indicated, it is of proven value in reducing the chances of visual acuity loss. The National Eye Institute sponsored and funded three major multicenter trials that proved conclusively that laser therapy was of value in treating both forms of diabetic retinopathy. The decision to recommend laser therapy is usually based on the appearance of the retina rather than upon the vision or symptoms of the patient. Indeed, patients with advanced proliferative diabetic retinopathy may have no symptoms and still be in desperate need of therapy. Thus, diabetic patients without symptoms should not assume that they are free of retinopathy.

If your eye exam reveals no signs of diabetic retinopathy, then an annual dilation exam is all that is necessary to be certain that worrisome changes are not occurring. On the other hand, if significant findings are observed on your initial evaluation, closer follow-up visits may be in order.

In summary, it is important for your team of doctors to be certain of the status of your retinal blood vessels so that your chances of later losing any vision are significantly minimized.

Diagnosis and treatment of depression in late life: Summary of the NIH consensus statement

Depressive illness is a major public health problem among Americans 65 and older. An estimated six million of the nation's 31 million people in this age group suffer with depressive symptoms severe enough to warrant treatment. There is also significant evidence that large numbers of elderly with depressive symptoms are misdiagnosed and untreated because the characteristic signs are masked by chronic medical problems or accepted as a normal part of aging.

Studies suggest that failure to get appropriate help for depressive symptoms—which are highly treatable—can lead to severe dysfunction, disability, and suicide. Health care experts are concerned that depressive illness will become an even greater public health problem in the future, since Americans 65 and older make up one of this country's fastest growing age groups.

During the past decade, substantial progress has been made in understanding depression in late life, but questions remain about the effectiveness of pharmacotherapy and psychotherapy treatments and how concurrent medical illness or physiological aspects of aging may alter responses to treatment.

To address these important issues, a Consensus Development Conference on the Diagnosis and Treatment of Depression in Late Life was convened by the National Institute of Mental Health (NIMH), in conjunction with the Office of Medical Applications of Research and the National Institute on Aging of the National Institutes of Health. The three-day meeting, held in November 1991, brought together experts in psychiatry, psychology, neurology, nursing, social work, internal medicine, epidemiology, and statistics.

Following presentations by biomedical and behavioral scientists and health care providers, and discussion by the audience, the panel considered the scientific evidence and reached a consensus on important issues affecting the management of depression and its symptoms in older Americans. In the statement, the panel reviewed what is known about diagnosis and useful treatments, identified areas needing further study or research, and stressed the need to alert both health care providers and the lay public to the seriousness of depression in late life.

In developing the consensus statement, the experts considered "depression" in a broad sense to describe a syndrome that includes physiological, behavioral-affective, and cognitive symptoms ranging from mild to severe.

According to criteria published in the American Psychiatric Association's *Diagnostic and Statistical Manual (DSM-III-R)*, symptoms of depression include changes in appetite and weight; disrupted sleep; diminished motor skills; fatigue and loss of energy; depressed or irritable mood; loss of interest or pleasure in normal activities; feelings of guilt, worthlessness, or self-reproach; lapses in concentration or thinking abilities; and suicidal thoughts or attempts.

The panel of experts concluded that key factors in the frequent misdiagnosis of depression in older people include the multiple, sometimes chronic, medical problems that overshadow depressive symptoms; a tendency for older adults not to report depressed moods; the willingness of the patient, family members, and health care professionals to expect and accept lower functioning abilities; and other social and economic difficulties that often accompany old age.

Among people 65 years of age and older, an estimated one million people suffer from major depression, while another five million people experience symptoms of depression severe enough to need treatment, according to the NIMH Epidemiologic Catchment Area (ECA) Study to assess the prevalence of mental disorders. The survey showed that the rate of depression and depressive symptoms in the over-65 age group ranges from 5% in primary care clinics to 15% to 25% in nursing homes. Over a one-year period, nearly 13% of nursing home patients develop new episodes of major depression and an additional 18% develop new depressive symptoms.

Although the incidence of depression in older adults varies widely according to the study sample and the criteria used to identify symptoms of the mental disorder, risk factors associated with higher levels of depression mirror those found in younger age groups. For example, in all age groups, women who are unmarried or widowed, burdened with stressful life events, or who lack a supportive social network are the most vulnerable. Studies also show that depression often accompanies physical problems like stroke and cancer, and that suicide is higher among people who suffer from depression.

The panel said that treatment goals for older adults should focus on decreasing the symptoms of depression and reducing the risk of relapse and recurrence, increasing the quality of life and improving medical health, and decreasing health care costs and mortality.

Psychosocial therapy and biological therapy, which includes pharmacotherapy and electroconvulsive therapy, are the major treatments available for depression. Numerous clinical trials involving adults of all ages have shown that about 60% of depressed patients improve when they are treated with antidepressant medications. However, more research is needed to determine if the rates of symptom relief, side effects, and quality of life measured in younger age groups are different in elderly patients. To date, few studies have focused on the growing numbers of people 80 and over. Studies also are lacking on how medical illnesses influence the treatment of depression in older adults.

Treatment compliance was seen as a serious problem among older patients. Studies presented to the panel showed that an estimated 70% of patients fail to take one-quarter to one-half of prescribed medications.

Electroconvulsive therapy (ECT) has been shown to be a safe and effective treatment of depression in the older patient. Studies have supported the need for more widespread availability of this treatment.

Psychosocial treatments including cognitive-behavioral, behavioral, interpersonal, and short-term psychodynamic therapies, are considered moderately effective in treating depressive symptoms among older people. As with clinical trials involving medications, however, few studies have been done to measure the efficacy of such psychological therapies in medically ill elderly or very old patients. Marital and family interventions, which have been successful in younger adults, also have not been evaluated in the elderly.

The panel also identified the special needs of the more than 800,000 Americans whose spouses die each year. Most widows and widowers are older and experience varying degrees of depressive symptoms in dealing with their grief. At least one-third of them meet the criteria for a major depressive episode in the first month after their spouse's death, and one-half of them remain clinically depressed a year later.

The panel identified a number of other problems:

- The stigma of mental illness as well as the acceptance of depression as part of aging deter many older adults from reporting their symptoms to family members or a physician, or from getting help if referred.
- Although about 85% of elderly adults visit a primary physician at least once each year, the majority of those who have depression are not diagnosed or treated for it.
- Patients who do receive treatment often stop taking

A review of the NIH consensus statement

Depression is common in elderly, medically ill patients, and many depressed elderly seek treatment from a primary care physician. This consensus statement is an excellent overview for the interested clinician on the topic of depression in late life. For example, it notes that 25 randomized studies have found antidepressants to be more effective than placebos in treating depression in the elderly. Several practical aspects of treatment are clearly reviewed. Antidepressant response may take 6 to 12 weeks in the elderly—a longer period than is usually required in the young. The measurement of plasma antidepressant levels is particularly important in the elderly and can ensure appropriate dosage, assure compliance, and avoid toxicity. The report also notes the importance of electroconvulsive therapy (ECT) in treating elderly depressives and points out that patients 60 and over constitute the largest age group receiving ECT.

The statement is also useful in defining aspects of late-life depression that are not known. Side-effect comparisons of ECT and tricyclic antidepressants have not been carried out, and surprisingly few studies on the psychosocial interventions with the elderly are in the literature.

The panel suggests four specific steps to improve treatment in depressed older individuals:

1. Continuing education programs should be designed to improve the knowledge of practicing physicians about depression.

2. Improved methods of case-finding in outreach need to be developed.

3. Training programs for the staff in institutional settings and community agencies need to be developed.

4. Outreach and social service delivery models for day-care and senior citizen programs should be developed.

This consensus statement should be of interest to all practicing physicians. Most practitioners will find that it does not discuss depression in the elderly in enough depth to stand on its own as an educational tool, but it does highlight our current understanding of late-life depression and will alert the clinician to the important questions in relation to its treatment.

PETER V. RABINS, M.D.

Dr. Rabins is an associate professor of psychiatry at the Johns Hopkins Medical Institutions. ■

prescribed medications, suffer side effects, or abandon treatment because they are overwhelmed by grief, poverty, or isolation.

- Many older adults are confused and overwhelmed by fragmented systems providing medical and mental health care and social services, and by myriad eligibility and funding requirements.
- Few training or continuing education programs exist to help primary care providers and mental health professionals learn to diagnose and treat depressive symptoms in older patients.
- Large numbers of elderly people live alone without adequate support systems.

The panel of experts offered these conclusions and recommendations as part of its consensus statement on depression in older people:

- Depression, which is widespread among older adults, is often misdiagnosed and not appropriately treated in the majority of cases in this age group.
- The prevalence of depression in nursing homes and residential care settings is high, and comorbidity with medical illnesses is common. Suicide rates are much higher among depressed elderly patients than in the general population.
- Data indicate antidepressant medications, ECT, and psychosocial intervention are effective treatments for depression and depressive symptoms in older adults. However, more research is needed to determine how factors like comorbidity of other medical illnesses and age-related reactions to medications affect treatment responses in this age group.
- Health care professionals accept impairment as part of aging and often lack the knowledge or skills needed to recognize depression in older patients. Training and continuing education programs should be provided to improve caregivers' knowledge and recognition of depressive symptoms and treatment intervention.
- Outreach programs are needed to identify and help the large number of elderly persons who suffer from depression or depressive symptoms but live alone without family or social support systems.

Free, single copies of the complete NIH consensus statement on the Diagnosis and Treatment of Depression in Late Life may be ordered from the Office of Medical Applications of Research, National Institutes of Health, Federal Building, Room 618, Bethesda, Maryland 20892 (301-496-1143). ■

Join us in a new kind of partnership ... uniting doctors, lawyers, teachers, parents, and youth against drug and alcohol abuse.

Become part of the Maryland Doctor/Lawyer/Teacher Partnership Against Drugs.

As a doctor, you can use your first-hand knowledge and experience to make a difference in winning the war against drugs. Become part of a unique initiative in Maryland to bring doctor/ lawyer education teams into schools to talk about the medical and legal consequences of drug and alcohol abuse.

From the library staff

Dr. Miller's article provides a good overview of the library's growth since its founding in 1832. Drs. Fonerden and Baker as well as Marcia Noyes, who served as librarian for 50 years, would be amazed at the changes that have taken place.

Marcia Noyes was required to live in the Faculty building so she could promptly answer physicians' inquiries. Today, with the advent of the fax machine, modem, and on-line databases, the library is still available on a 24-hour basis. Whether inperson, over the telephone, or via computer, library staff respond efficiently to physicians' needs.

The Med Chi Library is staffed by three full-time professionals, including an individual responsible for reference/on-line searching functions. The library subscribes to 312 medical journals, including a majority of the journals listed in Abridged Index Medicus. *Holdings of over 110,000 volumes include a basic collection of recent publications in medical research, preclinical sciences, and the social, economic, legal, and administrative aspects of medical practice. A notable collection of rare medical books used by Maryland physicians since the founding of the state in 1632 is housed in the*

The Library of the Medical and Chirurgical Faculty of Maryland

Doctors in the American colonies were poorly prepared for practice by apprenticeship. The traditional method of instruction was: "the teacher cites and the pupil recites," as medicine was taught by rote and observation. In addition, opportunity for instruction by reading after entering into practice was extremely limited. The earliest medical libraries were those established at the Pennsylvania Hospital in 1763 and at the New York Hospital in 1796.[1]

In the adolescent days of the Medical and Chirurgical Faculty of the State of Maryland, a few small privately owned collections of medical books existed, but they were not available for general use. The urge to teach themselves generated a fresh wind among the members of the Faculty at the annual meeting of 1830, as they realized that education and learning should not stop after the completion of medical school or an apprenticeship. Additionally, fees from the granting of licensure had accumulated in the previous 30 years, and several thousand dollars were available for expenditure. In 1799, the Maryland Legislature had stated "that the establishment and incorporation of a medical and chirurgical faculty or society of physicians in the said state will be attended with the most beneficial and salutary consequences by promoting and disseminating medical and chirurgical knowledge throughout the state."[2] This statement had remained unfulfilled until Dr. Samuel Baker of Baltimore offered a logical resolution at the annual meeting in 1830 to form a Library Committee and purchase standard works in medicine to be placed in a suitable location for members' use. After thorough discussion and a realization of the practicability and usefulness of the motion, it was carried out by the members present.[2–4]

Dr. John Fonerden was appointed librarian at a salary of 100 dollars per year, and a number of physicians contributed books to form the nucleus of the collection. In the initial stages, the library was probably located in the home of one of the doctors. In 1835, Dr. Samuel Chew was the librarian, and an announcement was made that the books could be found at his residence. Five years later, Dr. Chew moved the collection to his office at 88 North Howard Street, between Saratoga and Mulberry streets. From 343 volumes in 1832, the library had grown to 949 in 1840.

Actually, the library was in a traveling status without a real home, and its books were subject to loss in many ways. Pausing in a number of places for successively short stays, the book collection rested at the Maryland Bible Society, the office of Dr. Fonerden, and the rebuilt Athenaeum. A period of malaise was suffered in 1855 when books were not bought because of a lack of money, although the collection had grown to 1,250 volumes. At the an-

nual convocation in 1856, during a deep literary depression, a suggestion was made to give the library away, but, fortunately, the suggestion was not accepted.

The first real home of the Faculty was at North Calvert Street. Purchased in 1857, it had a second floor back room that was used as the library for 10 years, but, ultimately, the wandering began again. The move to Cortland Street in 1869 was unfortunate as the house was too small and the books were stored in unopened boxes for five years. Two different halls on Lafayette Street were used as temporary quarters when another crisis in the health of the library occurred. The Library Committee recommended the sale of the books and, in lieu of books, the formation of a collection of medical journals, hospital reports, and society transactions. The office of the surgeon general, through Dr. John S. Billings, offered to buy 100 of the better books, but reason prevailed again, and the collection was maintained intact.

With the move to North Eutaw Street in 1896, the haleness of the collection improved with the opening of the Frick Memorial Library. The expanding library quickly filled all available shelves. After relocation to Cathedral Street in 1909, the library continued to grow and now has over 100,000 volumes.

The "teen-age" years of the library were difficult to live through, but the fundamental commitment of the Faculty members led to a progressive growth not only in number of volumes but also in the influence and interest exerted by Faculty members. Drs. Baker and Fonerden would be amazed by the growth, sturdiness, and changing nature of their child.

In the late 1800s, Dr. John R. Quinan, a devoted lover of his profession, donated 100 volumes to the library. During this period, Dr. Eugene F. Cordell, an educator and professor of the practice of medicine, took an active part in nurturing the library. Busy as he was with his medical practice, he found time to be the librarian from 1870 to 1871 and from 1880 to 1887. (One of his major contributions to the history of medicine in Maryland was *The Medical Annals of Maryland. 1799-1899.*)

The contributions of Dr. William Osler to the library are often overshadowed by the tremendous medical aura surrounding him. A leader of American medicine during the time he was professor of medicine at the Johns Hopkins Medical School, he was keenly interested in the Med Chi Library. He missed the collection of books at the College of Physicians in Philadelphia and so set rapidly apace to refurbish what was a small, disorganized, and outdated library under the supervision of an unsuitable librarian. In 1889, the collection totaled less than 7,000 books. When he became president of the Faculty in 1896, Dr. Osler used the power of his office to improve the financial and operational existence of the library. He was fortunate in finding and hiring Miss Marcia C. Noyes, who was working at the Pratt Library, as the new librarian of the Faculty.[5–8]

Without doubt, Noyes created a great medical library and helped the Faculty in many ways as an operational assistant. She arrived in November 1896, just in time to celebrate the opening of the Charles Frick Reading Room in the new house on North Eutaw Street. One of the requirements for the position was that the librarian had to live in the same building, and this she did on Eutaw Street and later at Cathedral Street. Realizing the inadequacy of the North Eutaw Street site for all purposes, she became the driving force

Douglas G. Carroll History of Medicine and Rare Book Collection. This collection also includes manuscripts, medical instruments, prints, photographs, and paintings.

Access to medical information at Med Chi is enhanced by the library's automated information facilities. Med Chi owns the CDPlus CD-Rom MEDLINE database, which allows almost instantaneous access to more than seven million citations in medicine and the allied health sciences. The library also accesses BRS and Telebase, two of the world's largest database vendors.

Aside from strong medical journal holdings in-house, the library's document delivery services are complemented by access to two of the largest interlibrary loan/photocopy access databases in the world—DOCLINE and OCLC. Both DOCLINE and OCLC allow automated referral of interlibrary loan requests directly to libraries holding the journal or book title desired, allowing staff to minimize delivery time when the Med Chi Library does not own a given work.

If you are not familiar with the services the library offers, please call the library at 1-410-539-0872 or 1-800-492-1056.

MARGARET BURRI, M.A.

SUSAN HARMAN, M.S.L.S., M.Ed.
Head, Technical Services ■

in a building campaign to produce the present home. Noyes became the Faculty secretary in 1904 and the executive secretary in 1925.

Because of their direct bearing on health, medical libraries, in general, have enjoyed an unusual growth. Knowledge of the scientific literature is an essential part not only of medical investigation but also of day-to-day patient care. The use of the medical library and its journals as teaching aids in continuing medical education thus has its roots in the 18th century.

The present-day medical library offers specialized collections for particular bodies of users. Trained in medial librarianship, the staff offer essential and personalized direction.

The card catalogue has been changed, and books are now classified using the National Library of Medicine system. Staff use an electronic storage and retrieval system to find desired items. Books and, more particularly, journals that are constantly in demand need not be removed from the environs as photocopying machines permit instant reproduction of wanted portions of text. The publications need never be removed from the site, allowing almost simultaneous use by others.

The phenomenal growth of the library of the Faculty also reflects the tremendous growth of bioscientific literature. In the 18th century, the world count of journals was about 300; a few decades ago, 300 abstracted journals were published; and at the present time, 300 data banks exist.[9] Warren estimates that more than 20,000 biomedical series are published annually.[10] The prime reason for this great burgeoning of the literature is the urge for educational enlightenment by colleagues in various branches of medicine.

The use of the Medical Literature Analysis and Retrieval System in a central location with access ports in individual libraries, as in the Faculty library, has permitted a giant step forward in the rapid acquisition and transmission of knowledge. Although readers still visit the library, much of the staff's activity is directed toward telephone response. A tremendous change has occurred since the library was open for only a few hours every week. The acquisition of a full-time librarian was a tremendous step forward in the growth and preparation for use of the book collection, and now a staff of trained individuals is prepared to serve the members of the Faculty.

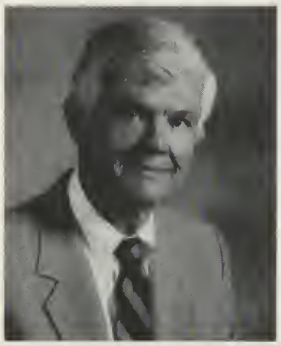
JOSEPH M. MILLER, M.D.

Dr. Miller is a retired surgeon from Timonium, Maryland. ■

Members in the News

H. LOGAN HOLTGREWE, M.D. was recently elected president of the American Urological Association. He is an assistant professor of urology at Johns Hopkins University and enjoys privileges at Anne Arundel Medical Center in Annapolis. Dr. Holtgrewe received his bachelor and medical degrees from Kansas University. His internship was completed at the Hospital of the University of Pennsylvania, and he was an assistant resident in general surgery at Duke University Hospital and a resident in urology at Kansas University. He also served as a medical officer in the US Navy Reserve. He is a member of numerous professional organizations in which he has held many offices. Dr. Holtgrewe has authored many journal articles, book chapters, and lectures.



THOMAS E. HUNT, JR. M.D. has been installed as president of the Baltimore City Medical Society. Dr. Hunt, originally from Pittsburgh, received his medical degree from the University of Maryland School of Medicine and completed residency training in orthopaedics at the Johns Hopkins Hospital. He maintains a private practice in orthopaedic surgery in Baltimore and is on the staff of Johns Hopkins Hospital, Children's Hospital, and Mercy Medical Center. Dr. Hunt has served as a consultant to the Division of Children's Services for over 30 years, and is also an orthopaedic consultatant for Stella Maris Hospice and the Hopkins Prosthesis Clinic. — Other officers installed in the Baltimore City Medical Society with Dr. Hunt include Donald H. Dembo, M.D., president-elect; K. George Dritsas, M.D., vice president; Willarda V. Edwards, M.D., secretary; and Murray A. Kalish, M.D., treasurer.

ALLAN D. JENSEN, M.D. was elected to a position on the Board of Trustees of the American Academy of Ophthalmology (AAO). A director-at-large since 1991, Dr. Jensen will now serve a three-year term as secretary for federal affairs. He received his medical degree from the Johns Hopkins School of Medicine and his undergraduate degrees from Johns Hopkins University. He completed a residency in internal medicine at Union Memorial Hospital and a residency in ophthalmology at the Wilmer Eye Institute. Dr. Jensen also was an exchange resident at Khalili Hospital in Shiraz, Iran. Currently, Dr. Jensen is a solo practitioner in Baltimore and is a member of many professional associations.

THEODORE C. PATTERSON, M.D. was presented the Baltimore County Medical Association's second annual Physician's Community Service Award. Dr. Patterson received this award for making the community a better place in ways other than the practice of medicine. He received his medical degree from the University of Maryland School of Medicine, a graduate degree from Howard University in Washington, DC, and his undergraduate degree at Morgan State University. Dr. Patterson was raised in Sparrows Point and has practiced medicine in Dundalk since 1964. His community involvement includes positions on college boards, leadership in social service organizations, and participation in the field of education. Dr. Patterson's long and varied community service has earned him numerous awards, as well as the respect and admiration of the community of Dundalk.

JOHN W. PAYNE, M.D. was honored as recipient of the Baltimore City Medical Society's Community Service Award. Dr. Payne received the award primarily for his work as director of volunteer physicians at the Joseph Richey House, a 12-bed in-service hospice which serves terminally ill patients including AIDS patients, regardless of their ability to pay. In addition, Dr. Payne was medical director of the Maryland Eye Bank for many years and was one of the first physicians in the country to recognize the importance of quality control in eye banks. Dr. Payne received his medical degree from the Johns Hopkins University School of Medicine and then served as a captain in the US Army Medical Corps. Dr. Payne is a member of many professional and community organizations, and currently teaches four to five hours per week.

BRUCE E. RUBIN, M.D. has been named as a fellow of the American College of Radiology (ACR). Selected for his outstanding contributions to the field of radiology, Dr. Rubin was one of 144 new fellows named by the college's Board of Chancellors. After graduating from the City College of New York (CUNY), he received his medical degree from the College of Physicians and Surgeons, Columbia University. His internship and residency were completed in internal medicine at Mary Imogene Bassett Hospital in Cooperstown, New York. He also served a residency in diagnostic radiology and a fellowship in special procedures and computed tomography at the George Washington University Medical Center in Washington, DC. Dr. Rubin has a military background, has received professional recognition on many levels, and is a member of many professional societies.

JONATHAN M. SUTTON, M.D. has been named the medical director of Pathways, Anne Arundel Medical Center's chemical dependency program for adolescents and young adults. Since 1966 Dr. Sutton has been on the staff of Anne Arundel Medical Center and was chief of pediatrics for five years. He attended medical school at the Medical College of Virginia and completed his internship and residency at Baltimore City Hospital. He worked in pediatrics at Dover Air Force Base and had a private practice in Annapolis. His interest in the field of chemical dependency was sparked when he began working with the American Academy of Pediatrics' Committee on Substance Abuse in 1986. Dr. Sutton is a member of numerous professional associations as well as community councils. ■

Physicians and the press: Medicine's new image

Now more than ever, professional organizations representing physicians are concerned with image as seen by the public and policymakers. The American Medical Association (AMA) has launched a Strategic Communications Plan, including the addition of a New York public relations office and an expenditure of almost $3 million on print ads. The AMA has even launched a new magazine for subscription by the public.

Concern about bad press and a slump in the profession's public opinion rating (69% of the public said people were losing faith in doctors, up from 64% in 1989) helped mold this new policy, as well as a new tagline, "Physicians dedicated to the health of America."

But as Dr. James Todd, executive vice president of the AMA, said, "You can't buy an image. You've got to earn it." As spouses of physicians, we feel most perceptions about the profession are wrong. Doctors are not overpaid, golf-playing, test-ordering, callous, greed machines. They are human beings, very intelligent ones, who care about their patients, and who often work long hours with little or no compensation.

Reading the *Washington Post* health section on Tuesdays became an infuriating exercise. Physicians were portrayed as performing unnecessary procedures, only seeing those who could afford health care, and overbooking patients to wait in waiting rooms. To whom was the press talking to? Where did they get such ideas?

We contacted the *Post* and arranged a forum with distinguished columnists Victor Cohn and Sally Squires. They were joined by Neil Ravin, M.D., a local endocrinologist and columnist for the *Washington Magazine*, and Dee McKenzie, director of WTOP news radio's "Call For Action" program. The panel was moderated by Jeffrey Molter, director of Science News for the *Journal of the American Medical Association*, who came from the AMA's Chicago office **(Figure).**

More than 160 local physicians and their spouses listened as each speaker related experiences with the medical community. The journalists had numerous suggestions on how physicians could best communicate with the press:

- If you are interviewed by the press, ask the reporter to read back the notes after the interview. Call your local medical society for guidance before interviewing.
- Be aggressive. A reporter may need convincing, but guide him or her as to how the subject could be covered.
- Form two or three messages you want to get across, and repeat them several times during the interview. If the interviewer gets offtrack, pick up the messages again and repeat them.
- Fax some non-jargon articles that present ideas you agree with to local journalists along with a note saying you'd like to discuss it. (Victor Cohn of the *Post* is looking for physicians who can present their side, perhaps showing him how managed care is going to affect practice.)

Figure. From left are Jeffrey Molter, Sally Squires, Victor Cohn, Dee McKenzie, Anne Bolen, and Nancy Warren, who served on a panel discussion of physician relations with the media.

- Invite journalists to see just how many forms you must deal with on a daily basis.
- Be available to reporters. They can smell two things: anger and fear. If they believe you are fearful, they'll think you have something to hide.

The old adage of the press is "Good news is no news; bad news is good news—we print bad news." The press is a place for controversy, but there is no reason that it cannot work *for* the profession as well as against it.

Diane Briggs, executive director of the Prince George's County Medical Society, said of the meeting, "Having worked in public relations, I wasn't surprised at what the press had to say, but I was surprised at the anger expressed by some individual physicians during the audience's turn." Many physicians brought specific articles to discuss with the press. The journalists' reaction was "the squeaky wheel is the one that gets oiled." They suggested writing to the editorial page to start a dialogue on subjects physicians want addressed.

Ms. Briggs says Prince George's County has had great success keeping communication lines open with the journalists at the meeting. Two programs have been produced by WTOP radio from ideas submitted by the medical society, and the journalists have been added to mailing lists from Montgomery and Prince George's counties. Ms. Briggs urges medical society staffers and individual physicians to contact the press with ideas—they will be used if you continually follow up on them. Be persistent, and you will be heard.

Overall, the meeting was productive and positive. The physicians came away with a greater awareness of reasons patients had been reading so many negative views of physicians, and the press saw and heard the physicians. Now it is up to those of us at local and state levels to keep those communication lines open and develop others. Perception is reality, and your patients and policymakers are reading, watching, and listening to the press. Medicine can present its side, but no one is going to come look for it.

If you have an idea to pass along, contact your local health or medical editor, the community affairs director of your medical society, or your local news station. They are hungry for stories, and it might as well be yours.

MARYLAND HYGEIA FILIAE AMCF

In Memoriam

Nachman Davidson, M.D.,

NACHMAN DAVIDSON, M.D., 82, died December 17 of Alzheimer's disease. He was an allergist, adjunct instructor at the Johns Hopkins medical school, and a navy veteran of World War II. Born in Baltimore, Dr. Davidson graduated from Baltimore City College, Lehigh University, and the University of Maryland School of Medicine. He then entered the navy and attained the rank of lieutenant commander. Following his navy career, he completed a two-year internship followed by studies in allergies at the Johns Hopkins University under a fellowship. In addition to private practice, Dr. Davidson also worked at outpatient clinics at Johns Hopkins, Sinai, and Lutheran hospitals. He was involved with the Guidance Service, a pioneering community mental health project operated with a parent teacher association, and was a charter member of Maryland's Department of Motor Vehicles Medical Advisory Board.

Elie K. Fraijl, M.D.

ELIE K. FRAIJI, M.D., a general surgeon in private practice in Baltimore, died of cancer on December 4 at the age of 62. A native of Lebanon, Dr. Fraiji received his early education in Zahle and Beirut. After graduating from the University of Science in Montpellier, France, he attended the Medical School of the University of Tours and then later, the Medical School of the University of Paris, from which he graduated. Dr. Fraiji then moved to Baltimore and served a residency at St. Agnes Hospital, becoming chief surgical resident. He remained active at St. Agnes Hospital, serving as a member of the executive committee of the staff, coordinator of the surgical training program, secretary, and treasurer. He also maintained an office in the Seton Professional Center.

Harry C. Hull, M.D.

HARRY C. HULL, M.D. died of congestive heart failure on December 15. Dr. Hull, 83, was a retired general surgeon who taught at the medical school and hospital of the University of Maryland for many years. He was born in Adamstown, attended public schools in Frederick, and the Franklin and Marshall College in Lancaster, Pennsylvania. He received his medical degree from the University of Maryland School of Medicine and served internships and residencies at St. Agnes and University of Maryland hospitals. Dr. Hull was a member of the staff of the University of Maryland and Maryland General hospitals, and a consultant to the United States Public Health Service Hospital. He traveled to the Far East and to Amman, Jordan. In 1963, he operated on the Jordanian prime minister, an uncle of King Hussein, and was awarded the Star of Jordan for his work there.

Donald J. Roop, M.D.

DONALD J. ROOP, M.D., 76, died December 19 of congestive heart failure. Dr. Roop was retired director of the Baltimore County Health Department. He graduated from Western Maryland College and the University of Maryland School of Medicine. He served his internship and residency at Mercy Hospital. He later attended Johns Hopkins School of Hygiene and Public Health where he earned a degree in public health. Dr. Roop also had a degree in tropical medicine from Walter Reed Hospital in Washington. He served in the US Army/Air Force and then practiced medicine in Frederick County with his father. He served as health officer for Frederick County before moving to Baltimore County to serve as assistant health officer, and later county health officer and director of the health department.

Sarah S. Tenenblatt, M.D.

SARAH S. TENENBLATT, M.D., a retired psychiatrist, died of a heart attack on November 17 at the age of 72. A native of Vladivostok, Russia, she was raised in Shanghai, and moved to California when she was 17. She received her undergraduate and medical degrees from the University of California at Berkeley. She served internships at hospitals in San Francisco before moving to Washington for a residency at St. Elizabeth's Hospital. She was on the staff of St. Elizabeth's during her early career. Later, Dr. Tenenblatt had a private practice in Silver Spring, and was an assistant professor of psychiatry at George Washington University Medical School. She was an officer and member of many professional organizations throughout her career.

No information was available at press time for the following members:

Robert W. Garis, M.D. (Baltimore), November 29, 1992

Daniel L. Hayes, M.D. (Montgomery), November 16, 1992

John W. Machen, M.D. (Baltimore), January 4, 1992

Milos B. Radwick, M.D. (Baltimore),

Henry L. Spiegelman, M.D. (Affiliate), November 24, 1992 ■

WELCOME!

The Medical and Chirurgical Faculty of Maryland welcomes the new members listed below. They join an organization with a 194-year history of dedicated service to improving the health and welfare of the people of Maryland. With the help and expertise of longtime members and the participation and input of new members, Med Chi can continue its proud tradition of ensuring quality health care.

Quality improvement and the hospital library

On Thursday April 8, 1993

The Maryland Association of Health Sciences Librarians (MAHSL) will offer a continuing education course entitled "Continuous Quality Improvement and the Hospital Library."

The course will be conducted by Chris Jones, a member of the Information Management Task Force of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO). Cost is $50 for MAHSL members and $75 for non-MAHSL members. Enrollment is on a first-come, first-served basis.

The course is scheduled to be held at the Medical and Chirurgical Faculty building from 8 am to 5 pm. To join MAHSL or to register for the course, call Myra Binau at Washington County Hospital (410-790-8801). For more information, call Kathy Curry at 410-532-3891.

Directory Changes

The Med Chi membership directory is published annually. It lists, by county, the addresses, phone numbers, specialties, board certifications, and specialty society affiliations of all Med Chi members. This update provides the most recent changes.

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

The Johns Hopkins Medical Institutions

All courses at the Thomas B. Turner Building unless otherwise indicated. For information on continuing medical education activities, contact the Office of Continuing Education, 720 Rutland Ave., Baltimore, MD 21205 (410-955-2959).

PET and SPECT brain imaging in clinical practice and research. 18 Cat 1 AMA/PRA credits. Fee: $495 physicians; $395 residents, fellows, and allied health professionals. Info: Patty Campbell, 410-955-6046 or Julia Buchanan, 410-955-8582. — **Mar. 10–12**

Spectrum of developmental disabilities XV: PL 94–142; PL 99-457—Issues of concern. 20 Cat 1 AMA/PRA credits. Fee: $425. — **Mar. 15–17**

Biological response to orthopaedic implants, at the Marriott Inner Harbor Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. Fee: $200 physicians; $125 residents and fellows. — **Mar. 19—20**

Problems in the diagnosis and management of the dysphagic patient: Transatlantic perspectives, at the Stouffer Harborplace Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. Fee: $425 physicians; $245 residents and allied health professionals. — **Mar. 29–30**

Diagnosis and treatment of neoplastic disorders, medical surgical, and radiotherapeutic aspects. 14.5 Cat 1 AMA/PRA credits. Fee: $300; $125 physician-in-training. — **Apr. 1–2**

Current concepts in thyroid disease: Update 1993. Cat 1 AMA/PRA credits available. Fee: $150 physicians; $40 residents and fellows. — **Apr. 16**

20th annual pediatric trends. 45 Cat 1 AMA/PRA credits. Fee: $625 physicians; $375 residents and fellows. — **Apr. 19–24**

34th annual postgraduate institute for pathologists in clinical cytopathology. Course A: Home study, March-April 1993. Course B: Lecture series with laboratory studies. 140 Cat 1 AMA/PRA credits. — **Apr. 19–30**

Clinical care of the patient with HIV infection, at the Stouffer Harborplace Hotel, Baltimore, MD. 13 Cat 1 AMA/PRA credits; 12.75 AAFP credits. Fee: $325 physicians; $165 residents, fellows and allied health professionals. — **Apr. 22–23**

Principles and practice of clinical MRI, at the Stouffer Harborplace Hotel, Baltimore, MD. Cat 1 AMA/PRA credits available. — **Apr. 22–25**

XII international papillomavirus workshop, at the Hyatt Regency Hotel, Baltimore, MD. 30 Cat 1 AMA/PRA credits. Fee: $400 prior to June 30, 1993; $450 after June 30, 1993. Info: Gretchen Shelton, 410-931-8108. — **Apr. 22–25**

Pediatric allergy and immunology for the practitioner. Cat 1 AMA/PRA credits available. — **May 6–7**

New frontiers in atherosclerosis and lipoprotein metabolism. Cat 1 AMA/PRA credits available. Fee: $200. — **May 13–14**

6th summer institute in environmental health studies. Info: Dr. Jacqueline Corn or Linda Lamb, 410-955-2609. — **June 7–18**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; thirty topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

University of Maryland

For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, MD 21201 (410-328-3956) or by calling the phone number listed after a specific program. FAX 410-328-3103.

Advanced trauma life support, sponsored by the Maryland Institute for Emergency Medical Services Systems, in Baltimore, MD. Info: Office of International Development, 410-328-2399. **Mar. 10–11**

Managed care and quality improvement: Making a difference, sponsored by the Maryland Institute for Emergency Medical Services Systems, in Baltimore, MD. Info: Office of International Development, 410-328-2399. **Mar. 11**

Alcohol and trauma care, sponsored by the Maryland Institute for Emergency Medical Services Systems, in Baltimore, MD. Info: Office of International Development, 410-328-2399.1 **Mar. 11**

R. Adams Cowley 15th national trauma symposium, sponsored by the Maryland Institute for Emergency Medical Services Systems, at the Hyatt Regency Baltimore, in Baltimore, MD. Info: Office of International Development, 410-328-2399. **Mar. 12–14**

Infectious diseases in everyday medicine—3rd annual symposium, at the Baltimore Convention Center, Baltimore, MD. 12.75 Cat 1 AMA/PRA credits. Fee: $175 physicians before 4/1/93, $200 after 4/1/93; $100 allied health professionals before 4/1/93, $125 after 4/1/93; $50 fellows, residents and students before 4/1/93, $75 after 4/1/93. Info: Eunice Katz, 410-706-7560. **Apr. 19–20**

Continuously throughout the year

Visiting professor program. A directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 410-328-3956.

Visiting fellowship in interventional radiology. Five-day practicum for radiologists, including conferences, patient rounds, and laboratory observations. By appointment only. 40 Cat 1 AMA/PRA credit. Fee: $1,200.

Ultrasound: Preceptorships. For physicians or sonographers with six-months' experience in practicing ultrasound. By appointment only. 40 Cat 1 AMA/PRA credit. $500.

Departmental rounds and conferences. Weekly, hands-on, and lecture presentations hosted by the university's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

Pediatric grand rounds. Every Thursday from September to June, except third Thursday, in the R. Adams Cowley Shock Trauma Auditorium. Info: Bonnie Winters, 410-328-6777.

Miscellaneous meetings

Future relationship between community and university hospitals, sponsored by the Baltimore City Medical Society, at the Union Memorial Hospital, Baltimore, MD. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **Feb. 4**

February, 1993

Questions and Answers about Tuberculosis

In 1991, 26,283 cases of tuberculosis (TB) were reported in the United States. This reflected an increase of 2% above the number of cases for 1990. In Maryland, 451 cases of TB were reported in 1991 which represents a 17% increase over the previous year.

Between 1950 through 1984, TB cases in the United States declined between 5-7% per year. Between 1985 and 1991, however, this trend was reversed and TB cases began to increase. There were an estimated 39,000 cases of TB over the number expected during that period. The increase is attributed to the occurrence of TB among persons with human immunodeficiency virus (HIV) infection, injectable drug users, immigrants from countries where TB is endemic, sheltered homeless, and residents of institutions.

It is the aim of this document to provide answers to the most commonly asked questions about TB.

Q. When should a hospitalized patient with tuberculosis disease be placed in isolation? What kind of isolation is appropriate?

A. It is essential that a hospitalized or institutionalized patient be placed in "acid fast bacilli (AFB) isolation" while the patient is being worked up for suspected tuberculosis. The key to making the diagnosis of TB in a timely manner is to suspect the disease in any person with signs or symptoms compatible with the disease.

Control measures include having the patient cover the nose and mouth when coughing or sneezing. In addition, persons with symptoms consistent with clinically active infectious TB should be placed in an AFB isolation room before the diagnosis is certain, until there is objective evidence that they are unlikely to be contagious. Air from adjacent rooms and corridors must flow into AFB isolation rooms (negative pressure), and exhaust air must not be recirculated to other rooms or corridors or vented outside to sites near air intake systems. Six air changes per hour, at least two of which are outside air, have been recommended for AFB isolation rooms.

Q. What are the symptoms of TB?

A. Among the clinical findings that suggest TB disease are cough, hemoptysis, weight loss, fatigue, night sweats, and unexplained fever.

Q. How do you perform a Mantoux test?

A. 0.1 ml of PPD (purified protein derivative) is injected into the volar surface of the forearm. The use of a skin site free of lesions and away from veins is recom-

mended. The injection is made using a one-quarter to one-half inch, 27-gauge needle and a tuberculin syringe. The PPD should be injected intradermally, just beneath the surface of the skin, with the needle bevel upward. A discrete, pale elevation of the skin (a wheal) 6 to 10 mm in diameter should be produced when the injection is done correctly. If it is recognized that the first test was improperly administered, another test dose can be given at once, selecting a site several centimeters away from the orginal injection.

Q. How are the results of a Mantoux tuberculin skin test read and interpreted?

A. The skin test reading is the size of induration determined by inspection of the skin test site (from a side view against the light as well as by direct light) and by palpation. The diameter of induration should be measured transversely to the long axis of the forearm and recorded in millimeters.

Persons who have induration following intradermally injected PPD may be infected with *M. tuberculosis* or may be infected with mycobacteria other than *M. tuberculosis*. Cross-reactions to other mycobacteria commonly occur in many parts of the world.

Because of these possible cross-reactions, a set of definitions has been established for a "positive tuberculin reactor:"

- Five or more millimeters of induration is called a positive tuberculin test for 1) persons with radiographic or clinical evidence of tuberculosis, 2) close contacts to cases of tuberculosis, 3) immunosuppressed or HIV-infected persons, and 4) children under 1 year of age.
- Ten or more millimeters of induration is called a positive tuberculin test for 1) foreign born persons from high prevalence countries (e.g., Asia, Africa, Latin America), 2) injectable drug users known to be HIV seronegative, 3) residents of nursing homes, correctional institutions, or other institutional facilities, 4) persons with silicosis, diabetes mellitus, chronic renal failure, lymphoma, weight 10% or more below ideal body weight, or prolonged high-dose corticosteroid or immunosuppressive therapy.
- Fifteen or more millimeters of induration is considered a positive skin test for all persons not included above.

Q. What is TB infection?

A. People who have TB infection have a positive reaction to the tuberculin skin test, negative bacteriologic studies (if done), and no clinical or radiographic evidence of tuberculosis disease. These people would be unaware of their infection by *M. tuberculosis* without benefit of a tuberculin skin test since they are asymptomatic.

Q. What do Maryland regulations require of a person with TB disease?

A.The Code of Maryland Regulations (COMAR) 10.06.01.22 Communicable Diseases--Tuberculosis requires that the control of a case of tuberculosis includes adequate chemotherapy, medical supervision, and appropriate instructions for control. Regulations further state that a health officer shall place in isolation a person having tuberculosis in a communicable stage who refuses to observe the instructions and exposes others to infection.

Q. What drugs should be used to treat tuberculosis?

A. Currently, the accepted regimen is an initial course of daily isoniazid (INH), rifampin (RIF), pyrazinamide (PZA), and ethambutol (EMB) for 2 months (induction phase), followed by INH and RIF for four months (continuation phase), for a total duration of 6 months of therapy in the absence of HIV infection. Streptomycin (SM) can be used in place of EMB in the initial regimen; however, SM is currently available only through the CDC. Drugs given in the continuation phase can be given twice weekly if every dose is directly observed.

Patients who have TB disease due to drug-resistant organisms, who have coexisting HIV infection, or who are unable to take one or more of the previously listed drugs will require a longer duration of therapy and may require different or additional drugs. All patients with TB should be offered appropriate HIV-antibody counseling and testing.

With adequate chemotherapy, almost all patients with organisms susceptible to the primary antituberculous drugs (INH, RIF, PZA, EMB, and SM) will become bacteriologically negative, recover, and remain well.

Q. What is multi-drug-resistant TB?

A. Multi-drug-resistant TB (MDRTB) is an emerging problem especially in those with TB-HIV coinfection. It is defined as resistance to at least INH and RIF, the two best anti-TB drugs. The principle of therapy for MDRTB is to treat with multiple drugs to which the organism is susceptible. The recommended initial regimen of INH, RIF, PZA, and EMB provides adequate coverage for most MDRTB while sensitivities are pending.

Q. What is the treatment regimen for drug-resistant cases of tuberculosis?

A. The main principle of therapy for drug-resistant TB disease is treatment with multiple drugs to which the organism is sensitive. Treatment for TB due to drug-resistant organisms may be more difficult, more toxic, more expensive, and not as successful as drug-sensitive organisms, depending on the drug resistance pattern. The Maryland DHMH, Epidemiology and Disease Control Program, Division of Tuberculous Control, has a contract with a pulmonologist to review the case history, treatment, and chest X-ray of each drug-resistant case of TB in Maryland to assure the adequacy of the regimen. There is no charge to the patient for these services.

Q. How should patients be followed during therapy?

A. Patients should be followed by inquiring about the resolution of their symptoms, and by obtaining first morning sputum specimens for AFB smear and culture on three consecutive mornings each month until culture results are negative. Patients should be monitored for drug reactions.

Q. How should failure to respond to therapy be recognized and treated?

A. Failure to respond can be recognized by:

- Lack of decreasing counts on smears;
- Persistently positive sputum cultures;
- Failure of symptoms to improve; and
- Worsening chest X-ray.

Causes of failure to respond include:

- Failure to treat with drugs to which the organism is sensitive;
- Failure of the patient to take the prescribed medications (may include drug intolerance, drug expense, recalcitrance, etc.); and
- Failure to absorb the medications.

Problems caused by failure to respond include worsening disease in the case patient, and continued transmission of TB. All cases of failure to respond should be thoroughly investigated and the need for restriction of activities should be reevaluated on a case-by-case basis.

Q. How can non-compliance be avoided?

A. Health care providers must promote compliance so that persons with infectious tuberculosis do not transmit infection.

Below are factors that, if recognized, may help providers improve patient compliance:

- The patient must perceive that the end result is important (treatment will cure a deadly disease);
- The patient must be capable of performing the task (i.e., taking a large number of pills daily);
- The patient must perceive the benefits from completing therapy (i.e., reduc-

tion in symptoms, not infecting family members); and

- The patient must incorporate the tasks into daily routines (e.g., coming to clinic for directly observed therapy).

Q. What is the role of the Maryland State TB Control Division?

A.The Division of TB Control in the Epidemiology and Disease Control Program of DHMH, in conjunction with local health departments, provides ongoing TB inservices and updates. Skin testing and interpretation certification is provided on request as well as annually on a regional basis for practitioners from both the public and private sectors, and correctional systems.

Medical consultation is provided to both public and private medical communities.

The Division of TB Control collects data from all 24 jurisdictions in Maryland. These data are analyzed to determine patients' response to therapy, and provide supervision of therapy whenever necessary. Data are computerized and aggregate state data are shared with the CDC for collating with the other states' data into national trends.

Also, the Division develops TB policies and procedures. Diagnostic and treatment services are made available at the local health departments through financial grants from the State. The State provides medications and free laboratory services.

Q.Where can a patient obtain "free" medication for treatment of tuberculosis disease?

A. A patient requiring medication for treatment of TB who does not have the means to purchase TB drugs, can obtain medications free of charge from their local health department. If the client has a third party prescription card or medical assistance prescription card, a reimbursement request will be generated.

Q. What TB services are available from the health department for the private client?

A. Cooperative efforts include free sputum examination, blood chemistries related to suspected adverse drug reaction, monitoring for drug reaction, and ongoing bacteriological follow-up.

The clinician may refer the patient for any or all of these services or for management of the entire TB treatment while still remaining the patient's primary medical care provider.

In the event that the clinician and patient choose to use the local health department services, a case update/medical monitoring form will be sent to the clinician every two months, until therapy is completed.

Q. What should a clinican do if the patient with TB disease is not-compliant?

A. The physician should report the patient to the local health department; the health department will assist in locating and monitoring non-compliant patients.

Q. What is BCG and what role, if any, does it play in tuberculosis?

A. BCG stands for the bacillus of Calmette and Guerin. Calmette and Guerin were two French scientists who serially subcultured a strain of *M. bovis* every three weeks for a period of 13 years (1906-1919). Two hundred thirty subcultures later, they found they had produced a significantly changed acid-fast bacterium that had retained its immunogenicity and was capable of sensitizing an animal or a person to tuberculin without causing the disease.

When BCG vaccine is injected into the body, the organisms multiply, and cause sensitization to mycobacteria. If the body is later exposed to an inhaled virulent *M. tuberculosis*, the previously sensitized immune system can inhibit its multiplication and spread. The beneficial effect of partial immunity may reach a maximum level in the first three years after vaccination, but may possibly persist for nine years. Observed immunity against *M. tuberculosis* varies between 80 percent and no beneficial effect at all.

Reminder:

Report all cases of suspected or confirmed tuberculosis to your local health department.

We Need A Doctor In The House

When the Maryland General Assembly convenes in Annapolis for its 1993 session, the Medical and Chirurgical Faculty will be there. Since 1964, Med Chi has staffed the first aid facility operated during the 90-day legislative session. Come join us at the state capitol building, and see the laws being made first hand. One doctor a day is all that is needed to care for the public, the legislators, and their staffs. Take advantage of the opportunity to donate something priceless, your time.

Please detach the postcard located at the top of this page, fill it out and mail it. A confirmation card will be sent to you explaining the details. You will be carrying on a tradition established by the medical community for the people of Maryland.

Doctor of the Day 1993

Note: All Monday dates are evening sessions, beginning at 4:00 p.m. and ending at 5:00 p.m. For more information, call Joyce Yensen at Med Chi's Legal Department, 410-539-0872 or call toll free in Md. at 1-800-492-1056.

Your time can make a difference.

Performing Arts Medicine II: Focus on Young Performers

A conference presented by the Committee on Medicine and the Performing Arts of the Medical and Chirurgical Faculty of Maryland

The second annual conference on performing arts medicine will advance the knowledge of health care professionals, performers, and educators regarding health problems faced by musicians, vocalists, and dancers. The program will emphasize care of student performers. The conference will consist of thirteen presentations and a short recital. The lectures will include audio-visual aids and, in several cases, performer demonstrations.

March 20-21, 1993
Med Chi Faculty Building
1211 Cathedral St.
Baltimore, MD

This conference is designed to educate physicians, both specialists and primary care practitioners, about the health and training problems faced by student performers during their secondary, college, and graduate training. They will learn to recognize problems of artists, some of which are unique to performers or have special occupational consequences. Various means of diagnosis, treatment, and rehabilitation will be presented. Special attention will be given to protecting young performers and preventing disabilities, by working in partnership with teachers and students.

Registration Form

Performing Arts Medicine II: Focus on Young Performers
March 20-21, 1993

Med Chi member physicians $50; nonmember physicians $75; allied health professionals $35; performers, music educators, students, residents $15. Tuition assistance available.

Return registration form and payment to
Susan E. Harman
Music Medicine Clearinghouse
Med Chi, 1211 Cathedral St.
Baltimore, MD 21201-5585

Optional attendance at the Baltimore Symphony Orchestra concert on Sunday, March 21 at 3 p.m. is an additional $15. The program will consist of works by Grieg, Richard Strauss, and Tchaikovsky, conducted by Eri Klas. To purchase BSO tickets, you must register by February 26.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

AMA launches new ad campaign on health system reform

The American Medical Association has launched a series of 13 ads in the Washington, D.C. print media. Its purpose: to position the AMA and its Health Access America reform proposal as a comprehensive plan to contain costs, improve access and maintain quality. The ads portray the AMA as working toward serious reform to bring health insurance access to all Americans.

The campaign began with a full-page ad in the Jan. 20 inaugural edition of the *Washington Post.* That ad set the tone for the campaign by suggesting a "Time for a New Partnership" among physicians, the new administration and a new Congress. The ad series will present the AMA's reform agenda to its key Washington audience in a clear, direct, honest way -- inviting partnership and negotiation.

Each ad offers a copy of the AMA's Health Access America proposal. Eleven issue-focused ads also offer readers a fact sheet on the issue addressed in that ad. The final ad will summarize the AMA's agenda and call again for partnership.

The ads are running approximately once a week until mid-April, except when Congress is not in session. Beginning with the second ad, placement is opposite the federal page in the *Washington Post.* The entire series is also appearing in the *Washington Post's* national weekly edition, read by opinion leaders nationally. In addition, the first ad ran in the new Congress issues of *Roll Call* and *Congressional Quarterly*, and in *Roll Call's* special edition on health care policy.

Bush signs changes in CLIA regulations

In his final week in office, President Bush gave his approval to a new waived category for physician-performed tests under the Clinical Laboratory Improvement Amendments. The AMA and a coalition of medical specialty societies had urged the President to authorize the new regulations, which also had been backed by outgoing HHS Secretary Louis Sullivan, MD.

The AMA already has stated its intent to work with the Clinton Administration to develop additional improvements to CLIA, but also stated that the changes represented a significant first step toward improving the measure.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

AMA offers coverage to students, residents

Medical students and residents can now participate in a comprehensive insurance program through the AMA Insurance Agency Inc. The new MedPlus Advantage program offers three policies: life insurance up to $50,000; portable disability income of up to $2,500 per month, which students can carry from medical school to residency; and $2 million comprehensive major medical coverage for students and their dependents. Optional maternity coverage is also available.

To be sure the program met students' needs, MedPlus got input from AMA student members on what they wanted in a benefit plan. MedPlus recognizes the special insurance risks of students and residents; it even offers a rider covering up to $100,000 of educational debt if a student becomes totally and permanently disabled.

Acceptance in MedPlus is guaranteed to all enrolled students, regardless of their health status, and is available on a group basis through participating schools. AMA Insurance Agency Inc. is a wholly owned subsidiary of AMA, providing insurance for physicians and medical students and their families.

Now available: AMA Guidelines for Adolescent Preventive Services

Adolescence is a time of great change. It is the time we expect our children to grow -- physically and emotionally -- into adults. With this tremendous growth often comes a rapid increase in behaviors that put an adolescent's health at risk. Unsafe sexual behavior or experimentation with drugs are just two ways teens may expose themselves to health risks.

In the past, health issues facing adolescents have been dealt with piecemeal. However, ensuring a healthy transition into adulthood requires that these issues be viewed as a whole, with traditional physical and psychosocial development and contemporary health problems addressed together.

To help primary care providers do this, the AMA has just developed *Guidelines for Adolescent Preventive Services* (GAPS) -- a set of recommendations for delivering a *package* of adolescent clinical preventive services.

You can request a copy of the GAPS guidelines by calling the AMA Department of Adolescent Health at 800 AMA-3211, ext. 5570.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

INTERNAL MEDICINE

Full-time internist-BC/BE. Salary and benefits will vary with experience. Send CV to: Suite B-216, 4000 Mitchellville Rd., Bowie, MD 20716.

FAMILY PRACTITIONER

Competition, HMOs, Insurance and slow-paying patients... it's enough to make you sick.

The problems of managing a practice today can really make you sick.

Even worse, they can make the business end of your practice sick, too. That's where we can help.

We're CBSI, the leader in medical office automation systems since 1977. Our Physician Information System submits your insurance forms electronically, posts payments and adjustments automatically, and rushes you complete, up-to-the-minute patient clinical and financial data. Currently relied upon by more than 5,000 physicians in over 50 medical specialties around the area. More than 99% of these systems are still in use today because they're flexible, adaptable and CBSI backs them with unparalleled hardware maintenance, customer support and training.

Since 1981, CBSI continues to be the only provider of medical office automation endorsed by The Medical Society of The District of Columbia.

Physician Information System helps manage your practice, while you manage your patients.

Call 770-2292 right now to find out more about Physician Information System. In Maryland, call toll-free at 1-800-638-6364.

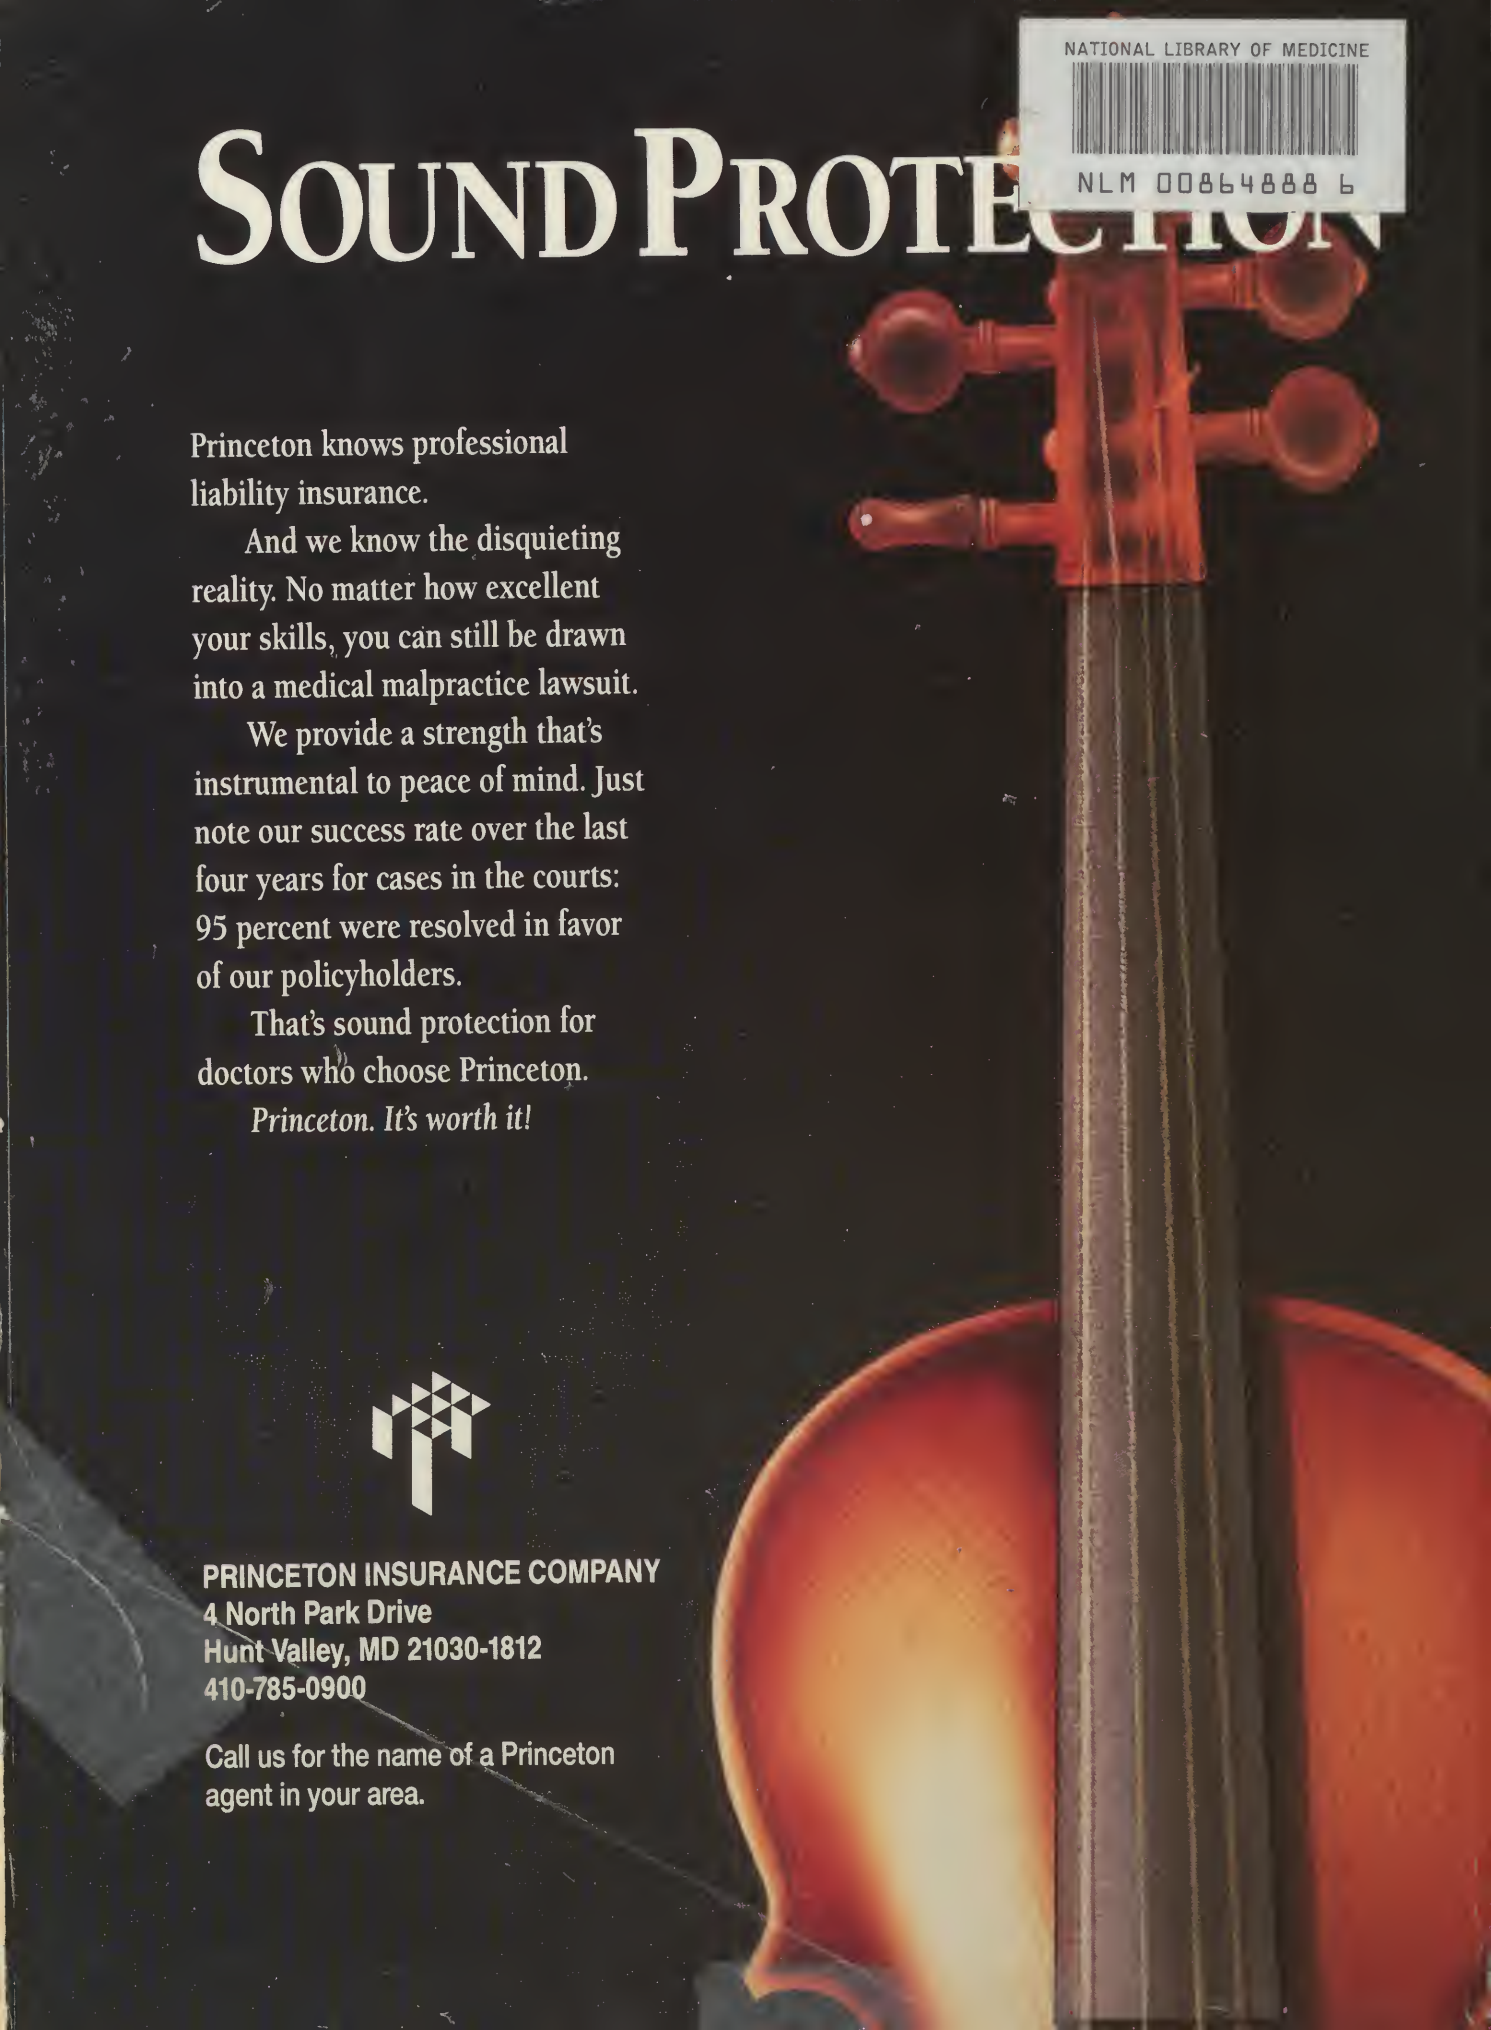
SOUND PROTECTION



Princeton knows professional liability insurance.

And we know the disquieting reality. No matter how excellent your skills, you can still be drawn into a medical malpractice lawsuit.

We provide a strength that's instrumental to peace of mind. Just note our success rate over the last four years for cases in the courts: 95 percent were resolved in favor of our policyholders.

That's sound protection for doctors who choose Princeton.

Princeton. It's worth it!

Straight Talk. Doctor-To-Doctor.

When you're tired of playing games with risk retention groups or insurance companies, we'll be glad to give you the straight talk you need to make your best choices

Straight talk about coverage options, premium discounts, free retirement coverage, risk management programs, and all the kinds of choices doctors really need.

Where did we learn to talk like this? Simple. We're run by doctors, and doctors are too busy to play games.

To learn more about joining the thousands of your physician colleagues insured by one of the companies of the Medical Mutual Group, call us at 1-800-492-0193.

Doctor-to-doctor. What better way to hear it straight?

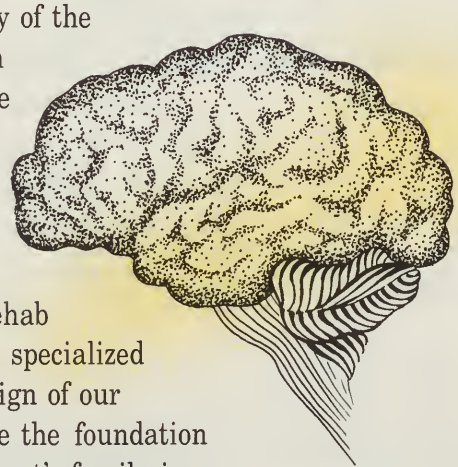
THE BRAIN

The human brain can compose silly rhymes or beautiful poetry.

It can imagine a dream world or study the mysteries of the atom.



It can remember two dozen birthdays or forget one anniversary.

It can recall the good old days or predict the future.

It can hide emotions or laugh uncontrollably.

It can uncover the meaning of love or the meaning of life.

At Maryland General-Bryn Mawr Rehab Center, we understand the power and complexity of the brain. We also understand that when an individual sustains a brain injury, stroke or other neurological condition, extensive knowledge and enormous energy are required to guide the person toward a successful recovery.

Our affiliation with Bryn Mawr Rehab brings twenty years of knowledge to our specialized treatment programs. The innovative design of our facility and our experienced staff provide the foundation to assist you, your patient and your patient's family in setting goals for recovery and then achieving them. Working together, just think what we can accomplish.

When Is A Townhouse Not A Townhouse? When It's Built By Gosnell.

RIVER FALLS
Potomac's Family Community.

Almost four years in the planning, River Falls' Town Estates represent a new concept in luxury living. Here, residents can enjoy the elegance, space and comfort of the finest custom homes while enjoying the ultimate luxury of freedom.

These homes are unlike anything you have ever seen before. Starting from the 36 foot widths and attached garages to the NINE foot ceilings on BOTH first and second floors. Add the extensive architectural detailing from the interior three-piece moldings to the exterior molded bricks. And floor plans designed to make living easy and built with pride and quality that goes into every Gosnell home.

Town Estates offer homeowners the best of all worlds. "Ron's Rule—I give myself one week to meet new people and start having fun on a locum tenens assignment. It hasn't failed me yet."

Ron Richmond, MD, joined the CompHealth locum tenens medical staff when he completed his residency. He wanted to travel. He loves to meet people. A little time off sounded really good. And he thinks being exposed to different types of medical practice will serve him well when he returns to his hometown to establish a community health center.

A singer. A board-certified family practitioner. A soft-spoken New Yorker. Ron Richmond knows...

It's a great way to practice medicine

195th Annual Meeting of the Medical and Chirurgical Faculty of Maryland

at the

University of Maryland
University College Conference Center
College Park, Maryland

Prevention 1993 – Maryland
Preliminary Program

Thursday-Saturday, April 29-May 1, 1993

Support Our Exhibitors
Exhibits are an important part of Med Chi's annual meeting and are a valuable adjunct to the scientific program.

By visiting the exhibits before and after your scientific programs, you will help ensure that Med Chi receives valuable income that allows us to offer you annual and semiannual meetings.

Med Chi urges you to express your appreciation to exhibitors by visiting their booths and discussing your mutual involvement in patient care.

Continuing Medical Education Credits
The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education activity for up to 16 credit hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Physicians attending this year's meeting can earn up to a maximum of 16 CME credits.

Hotel Reservations
The University of Maryland University College Conference Center in College Park offers comfortable accommodations complete with color cable television, telephone, private bath and desk. Guests at the conference center can also enjoy a wide variety of recreational facilities including an 18-hole golf course, tennis and racquetball courts, weight rooms, swimming pools and jogging paths.

Med Chi has reserved a limited number of rooms at a special group rate of $65.00 for a single occupancy room and $80.00 for a double occupancy room.*

To make a reservation, call 1-800-727-8622 and give the Med Chi group number: G2568.

*Tax and incidentals not included.

Telephone Messages
During the meeting, messages may be relayed to participants by calling 301-985-7300.

Miscellaneous
Contact Joan Mannion at 1-800-492-1056 or 410-539-0872 with questions about continuing medical education sessions.

For general questions regarding the annual meeting, call Betsy Newman at 1-800-492-1056 or 410-539-0872.

Directions
The University of Maryland University College Conference Center is located at the corner of University Boulevard and Adelphi Road in College Park, Maryland.

From Baltimore and points north:
Take I-95 South to the Capital Beltway (I-495) toward College Park. Take exit for U.S. 1 South (Exit 25B). Proceed approximately 1 mile south on U.S. 1 and turn right onto MD Route 193 West. At 3rd traffic light, turn left onto Adelphi Road. On Adelphi, make first, immediate left onto Campus Drive. The conference center will be visible on your left. Parking for guests is available in the 4th driveway on the left.

From Bowie/Annapolis areas and points east:
Take MD Route 50 to Capital Beltway (I-95). Go north on I-95 to College Park. Take exit U.S. 1 South (Exit 25B). Proceed approximately 1 mile south on U.S. 1 and turn right onto MD Route 193 West. At 3rd traffic light, turn left onto Adelphi Road. On Adelphi, make first, immediate left onto Campus Drive. The conference center will be visible on your left. Parking for guests is available in the 4th driveway on the left.

From Washington, DC:
Take George Washington Parkway to I-495 (toward Rockville). Follow I-495 and take exit for New Hampshire Avenue/Takoma Park (Rt. 650). Go south on New Hampshire Avenue and turn left at the second light (Adelphi Road). Stay on Adelphi Road forapproximately 3 miles (you will go through 3 traffic lights). At the 4th light, turn left onto Campus Drive. The conference center will be visible on your left. Parking for guests is available in the 4th driveway on the left.

From Montgomery County and points west:
Take the Capital Beltway (I-495) to New Hampshire Avenue/ Takoma Park (Rt. 650). Go south on New Hampshire Avenue and turn left at the second light (Adelphi Road). Stay on Adelphi Road for approximately 3 miles (you will go through 3 traffic lights). At the 4th light, turn left onto Campus Drive. The conference center will be visible on your left. Parking for guests is available in the 4th driveway on the left.

Early Intervention in Rheumatoid Arthritis — Does it Make a Difference?
Maryland Society for Rheumatic Diseases

Moderator:
Marcia C. Schmidt, M.D., President,
Maryland Society for Rheumatic Diseases

Speakers:
Howard Hauptman, M.D., Vice President,
Maryland Society for Rheumatic Diseases
Chief, Department of Rheumatology,
Greater Baltimore Medical Center
Ira Fine, M.D., Chief,
Department of Rheumatology, Sinai Hospital
Anneli H. Navarro, P.T., M.Ed.
Mauro, Navarro and Hart, Physical Therapy
Marcia C. Schmidt, M.D.

Objectives:
Participating physicians will
- understand the criteria for diagnosis of rheumatic disease,
- be able to identify suitable patients for early treatment and
- be aware of effective early treatments to minimize or prevent deformities.

Target Audience:
Family physicians, primary care physicians and general internists

CME Credit: 1.5

9:00 am - 10:30 am
Room 1123
Case Management of the Seropositive HIV Patient
Committee on Aids

Speakers:
Lois Eldred, P.A., M.P.H.
Director of Support and Education Services
The Moore Clinic
Eric Fine, M.D., Assistant Director, AIDS Help Services,
Maryland Department of Health and Mental Hygiene

Objectives:
Participating physicians will
- be better able to manage their HIV-positive patients and
- be aware of patient care resources and educational services available throughout Maryland.

Target Audience:
Primary care physicians, infectious disease specialists, public health physicians and other physicians with HIV–positive patients

CME Credit: 1.5

Family physicians and internists

CME Credit: 1.5

8:30 am - 10:00 am
Room 1123
Prevention of Disease in Pediatrics and Primary and Secondary Cancer Prevention
Maryland Academy of Family Physicians and the Department of Family Medicine, University of Maryland

Moderator:
J. Roy Guyther, M.D., Clinical Associate Professor, Department of Family Medicine, University of Maryland

Speakers:
Primary and Secondary Cancer Prevention — How It Hasn't Been Done
Gayle Hopper, M.D., Clinical Associate Professor, Department of Family Medicine, University of Maryland
Prevention in Pediatrics
Gregory Taylor, M.D., Assistant Professor, Department of Family Medicine, University of Maryland

Objectives:
Participating physicians will
- be aware of current information about primary and secondary cancer prevention in the office setting and
- be able to discuss prevention strategies for children

Target Audience:
Family physicians and general internists

CME Credit: 1.5

10:00 am - 12:00 noon
Room 1109
Latex Anaphylaxis and an Overview of Intraoperative Anaphylaxis
Maryland Asthma and Allergy Society

Moderator:
John Bacon, M.D., President, Maryland Asthma and Allergy Society

Speakers:
Latex Anaphylaxis
Jay Slater, M.D., The Children's National Medical Center
Overview of Intraoperative Anaphylaxis
Richard Moscicki, M.D., Allergy Associates, Massachusetts Hospital

Objectives:
Participating physicians will
- be aware of the increased incidence of anaphylaxis, appropriate evaluation and treatment and
- be aware of differential diagnosis and treatment of intraoperative anaphylaxis.

Target Audience:
Pediatricians, internists, family physicians, surgeons, otolaryngologists, anesthesiologists and allergists

CME Credit: 2

10:00 am - 12:00 noon
Chesapeake Room
Prevention of Heart Disease and Stroke — The Basics and the Controversies
American Heart Association-Maryland Affiliate, Inc.

Moderator:
James P.G. Flynn, M.D., M.P.H., Chairperson, Medical Education Task Force; Director, Corporate Rehabilitation Services, University of Maryland Medical System

Speakers:
Back to the Basics — The Big Four CVD Risk Factors
Michael Miller, M.D., Assistant Professor of Medicine, Director of Preventive Cardiology, University of Maryland School of Medicine
Prevention of Stroke: The Role of Aspirin
Michael Sloan, M.D., Assistant Professor of Neurology, Radiology, Epidemiology and Preventive Medicine, University of Maryland Hospital
Treatment of Hypercholesterolemia in Women: The Role of Estrogens
Trudy L. Bush, Ph.D., M.H.S., Associate Professor of Epidemiology, The Johns Hopkins University School of Hygiene and Public Health
The Role of Alcohol in Management of the CVD Patient
Simeon Margolis, M.D., Ph.D., Professor of Medicine, The Johns Hopkins University

Objectives:
Participating physicians will
- know the risk factors for CVD and stroke,
- be aware of the role of aspirin in prevention,
- be aware of the cardiopreventive effects of estrogen replacement therapy and
- be able to discuss the pros and cons of prescribing alcohol to patients.

Target Audience:
Internists and family physicians

CME Credit: 2

Special Guest
Raymond A. Scalettar, M.D.
Chair, Board of Trustees
American Medical Association

Raymond Scalettar, M.D., a practicing internist and rheumatologist from Washington, DC, and a founding partner of the Washington Internal Medicine Group, was re-elected in June 1991 to the American Medical Association (AMA) Board of Trustees and was elected secretary/treasurer of the AMA. In June of 1992 he was elected chair of the AMA Board of Trustees. He had served as chair of the AMA commissioners to the Joint Commission on the Accreditation of Healthcare Organizations from January 1991 to June 1992.

Until his election to the board in 1985, Dr. Scalettar was chair of the AMA Committee on Professional Liability and served on the AMA Council on Medical Service since 1981. He was an alternate delegate from the Medical Society of the District of Columbia to the AMA House of Delegates from 1969 to 1975 and became a delegate in 1978.

Dr. Scalettar is past president and past chair of the board of the Medical Society of the District of Columbia, and is vice chair of National Capitol Underwriters, Inc., the manager for the Society's professional liability insurance company. His longstanding interest in professional liability prompted him to become a founder and chair of the Society's Legal Resources Fund and chair of the National Capitol Brokerage, Ltd., a subdivision of the Society's professional liability insurance company.

Dr. Scalettar and his wife, Nada, reside in North Bethesda, Maryland. They are the parents of a daughter, Lydia, and a son, Mark.

10:00 am - 10:30 am

Break — Visit the Exhibits

10:30 am - 12:00 noon
Room 1105
Recent Breakthroughs in Understanding and Reducing Physician Stress
Physician Rehabilitation Committee

Introducer:
Stanley R. Platman, M.D., Chairperson, Physician Rehabilitation Committee

Speaker:
Morton C. Orman, M.D., General Internist

Objectives:
Participating physicians will
- recognize three very common — but inaccurate — beliefs about stress,
- understand why physical exercise, meditation and other relaxation techniques are not the best strategies for relieving physician stress and
- learn about a new and effective coping method for dealing with anger, frustration, worry, guilt and other "hassles" of professional life.

Target audience:
All physicians

CME Credit: 1.5

10:30 am - 11:30 am
Room 1123
Breast Cancer Prevention
Committee on Scientific Activity; the Department of Surgery, University of Maryland School of Medicine

Introducer:
J. Richard Lilly, M.D., Chairperson, Committee on Scientific Activity

Speaker:
E. George Elias, M.D., Professor of Surgery and Oncology, University of Maryland School of Medicine

Objectives:
Participating physicians will
- be able to identify women who are at increased risk of developing breast cancer,
- be able to state the difference between prevention and early detection of breast cancer and
- be able to refer interested women to a site where the Breast Cancer Prevention Trial is being conducted in Maryland.

Target Audience:
All physicians interested in breast disease, especially family physicians, obstetricians, gynecologists, general internists, general surgeons, surgical oncologists and medical oncologists

CME Credit: 1

12:00 noon - 1:00 pm
Lunch on your own

12:00 noon - 1:30 pm
VFF Room
Practice Management Strategies for Young Physicians
Physician's Practice Digest
(Pre-registration is required for this luncheon meeting which has the corporate sponsorship of CBSI, Med Chi Agency, and the Medical Mutual Liablity Insurance Society of Maryland. See registration form for details.)

Introducer:
Mehrdad Massumi, M.D., Chairperson, Med Chi Committee on Young Physicians

Speakers:
Michael Hodes, Esq., Partner, Hodes, Pessin, and Katz
Charlotte Kohler, Principal, Kohler Health Care Consultants

Objectives:
Participating physicians will
- be aware of the legal and economic issues to consider when starting or joining a practice,
- understand negotiating strategies, right of affliation, cost of entry, employment agreements, buy/sell agreements, business contracts, and loan consolidation and
- review operational issues of starting a practice, such as leasing space, office equipment, hiring personnel, benefits and compensation for staff, marketing, referrals, automation, and cash flow management.

Target Audience:
Physicians under the age of 35 or any physician interested in improving practice management.

**Please note this is a preliminary program. More meetings, events, and continuing medical education activities may be added to the final program, which will be distributed at the meeting.

Executive Director's Newsletter

March 1993

Annual Meeting Preliminary Program

Preceding this newsletter is a revised preliminary program for the 1993 Med Chi Annual Meeting: "Prevention 93 — Maryland." The preliminary program features detailed information about the meeting including speakers and course objectives for continuing medical education (CME) sessions. To register for this meeting, complete the registration form following the preliminary program.

Board of Physician Quality Assurance Nominations

Pursuant to §14-202 of the Health Occupations Article of the *Annotated Code of Maryland*, the Medical and Chirurgical Faculty of Maryland is announcing that an election, for the purpose of selecting names to be submitted to the governor for possible nomination to the Board of Physician Quality Assurance, will be held at the following place and time:

Saturday, May 1, 1993, at 2 pm
University of Maryland
University College Conference Center
College Park, Maryland

All licensed physicians in Maryland are eligible to vote. Physicians are requested to bring proof of licensure.

The following physicians, nominated through a process open to all licensed physicians in Maryland, will be on the ballot:

Frederick P. Alpern, M.D.
Ira N. Brecher, M.D. (incumbent)
Irvin H. Cohen, M.D.
Sanford H. Eisenberg, M.D.
Lawrence C. Jones, M.D. (incumbent)
Charles Kaelber, M.D.
Suryabala B. Kanhouwa, M.D.
Santosh D. Kaushal, M.D.
Kenneth R. Lippman, M.D.
Lois H. Love, M.D.
Melvin Museles, M.D.
Joseph J. Reidy, M.D.
Michael K. Spodak, M.D.
Ronald J. Taylor, M.D.

If you plan on attending the election, directions to the University of Maryland Conference Center appear in the annual meeting preliminary program preceding this newsletter. If you do attend, please remember to bring your medical license.

Anti-Tobacco Warning Labels for Magazines

Physicians are encouraged to use the new Med Chi peel-and-stick warning labels for magazines containing tobacco advertising. The labels read, "Warning: This magazine contains cigarette advertisements. Your physician does not support the use of any tobacco products or the advertisement of such products." Sample labels appear in this journal. Free additional labels are available by calling the Med Chi switchboard operator at 410-539-0872 or 1-800-492-1056.

Nominations for 1993-1994 Med Chi Officers

The following is the listing of the slate of officers selected by the Med Chi nominating committee for the year 1993-1994. Additional nominations for officers will be accepted during the House of Delegates meeting on Friday, April 30, 1993, at 2:00 pm. The election for 1993-1994 offices will be held on Saturday, May 1, 1993, during the House of Delegates meeting which begins at 1:30 pm. Both meetings will be held at the University of Maryland, University College Conference Center, in College Park, Maryland. (For directions to this meeting, see the preliminary program preceding this newsletter.)

(Those elected will assume office at the conclusion of the 1993 annual meeting, unless otherwise indicated.)

For Presentation at the House of Delegates Friday, April 30, 1993

President-elect
Joseph S. Fastow, M.D., Calvert County
(President-elect 1993-1994) (President 1994-1995)

First Vice President
Alex Azar, M.D., Wicomico County

Second Vice President
J. Ramsay Farah, M.D., Washington County

Third Vice President
Thomas E. Allen, M.D., Baltimore County

Secretary
Paul A. Stagg, M.D., Dorchester County

Treasurer
Carol W. Garvey, M.D., Montgomery County

Finney Fund Committee
Robert G. Greenfield, M.D., Montgomery County

Delegates to the AMA *(January 1, 1994-December 31, 1996)*
Donald T. Lewers, M.D., Talbot County
George S. Malouf, M.D., Prince George's County

Alternate Delegates to the AMA *(January 1, 1994-December 31, 1996)*
Carol W. Garvey, M.D., Montgomery County
Reynaldo L. Lee-Llacer, M.D., Prince George's County

Alternate Delegate to the AMA to Fill Unexpired Term
(to December 31, 1994)
Jose M. Yosuico, M.D., Baltimore City

Nominating Committee 1992-1993
J. David Nagel, M.D., Baltimore County, Chairperson
Leslie R. Miles Jr., M.D., Western Maryland
Paul A. Stagg, M.D., Eastern Shore
Hilary T. O'Herlihy, M.D., Southern Maryland
Cheryl E. Winchell, M.D., Montgomery County
John Richard Lilly, M.D., Prince George's County
Donald H. Dembo, M.D., Baltimore City
Mayer C. Liebman, M.D., Baltimore County
Hiroshi Nakazawa, M.D., Member-at-Large

March 22, 1993

Medicare EMC Team

Medicare is committed to increasing the number of claims submitted electronically. A dedicated team of employees has been established to assist you in

- understanding the advantages of Electronic Media Claims (EMC)
- understanding how EMC works
- selecting a vendor
- testing
- converting to electronic billing

For more information on EMC submissions, see the ad on page 328 of this *MMJ* or, for a free listing of approved vendors to help you with electronic claims technology solutions, call 410-561-4277.

Submitting Electronic Media Claims vs Paper Claims

As an Electronic Media Claims (EMC) biller, are you still submitting certain claim types on paper? Paper claims are often submitted because providers do not realize that services can be billed electronically or do not know how to provide additional documentation electronically.

Practically all Medicare services can be submitted electronically. You can avoid unnecessary delays in payment by submitting all services electronically. And, if you are interested in receiving electronic fund transfers, you must submit at least 90 percent of your claims electronically.

If you are unsure about how to submit a particular service electronically, contact the EMC team at 410-561-4277.

Workers' Compensation Commission, Medical Claims: Processing Backlogs/Bills and Invoices

Maryland Workers' Compensation Commission is now processing medical claims at the rate of approximately 200 per week with a similar number being sent for review on a contractual basis. The commission believes that the backlog should be completly eliminated within three months. As a reminder, the commission notes that medical claims (WCC form C-51) should not be submitted by a health care provider to the commission until after a bill/invoice for the treatment has been sent to the employer/insurer and has been rejected or ignored. It is the provider's responsibility to properly invoice the employer or the insurer. The failure of the health care provider to first submit a bill to the employer/insurer will only delay the processing of the claim.

Lyme Disease Study

The Maryland State Health Department and the University of Maryland School of Medicine have received federal funds to study patient outcomes after antibiotic therapy for Lyme disease. This study should provide useful data to assist the practicing physician in managing Lyme disease. Therefore, we urge you to report all suspected cases of Lyme disease to your local health department immediately.

1993 Semiannual Meeting

Mark your calandars! The 1993 Med Chi Semiannual Meeting will be held Friday-Sunday, September 10-12, 1993 at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland.

Med Chi has obtained a special group rate of $110/night for a single/double occupancy room* for this meeting. To reserve your room, call the Sheraton at 1-800-638-2100.

*Tax and incidentals not included.

Health Care Scholarships Available

The Prince George's County Medical Society, in conjunction with its Auxiliary, offers scholarships annually to high school seniors. The criteria for the scholarships are academic accomplishments, financial need, demonstrated ability, and, most importantly, a desire to pursue a career in the health care field. There are 25 scholarships in the amount of $200 and three scholarships in the amount of $500. For more information about this program, contact Anna McDonagh at the Prince George's County Medical Society at 301-341-7758.

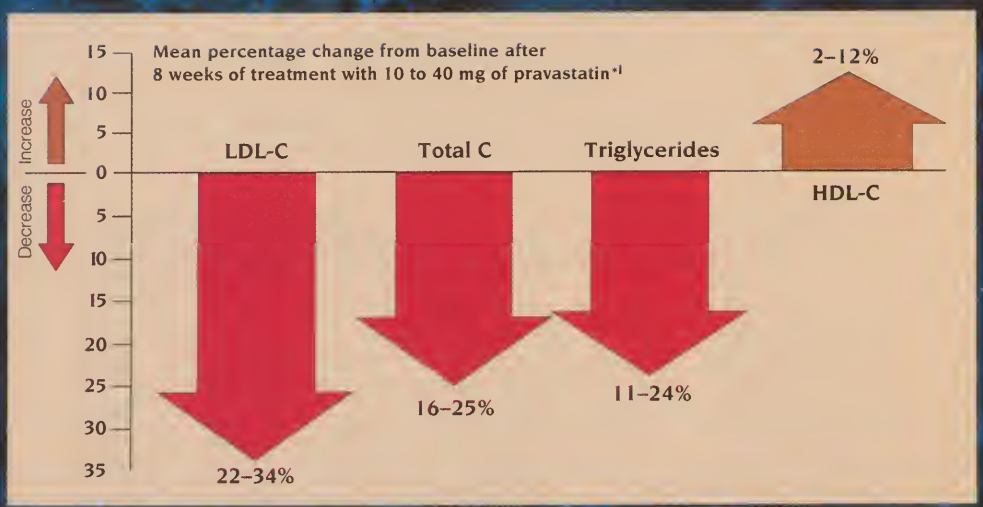
Legislative Rally in Annapolis

On Thursday, March 18, 1993, nearly 100 physicians attended the Med Chi legislative rally in Lawyer's Square in Annapolis. The purpose of the rally was to allow Maryland physicians to express their views regarding health care reform and other legislative issues. During the rally, Med Chi Council Chairperson Joseph Fastow, M.D. introduced several physicians from around the state who expressed their concerns about health care reform, including Michael Epstein, M.D., Charles Franklin, M.D., Elizabeth Kingsley, M.D., Patricia O'Hora, M.D., and Gary Sprouse, M.D.

"We're here to propose serious reform," said Michael Epstein, M.D., a gastroenterologist from Annapolis. "We are men and women who have dedicated our life to saving lives.... Health care is our number one concern."

"I have a patient I will call Jane," said Elizabeth Kingsley, M.D., an Annapolis cardiologist. "She came to my office with severe chest pain and was at definite risk for a heart attack. Because of a pre-existing medical illness clause in her insurance policy, she has to wait three weeks to be hospitalized for this fatal condition. If Jane dies, the system will have contained costs, but Jane will have lost her life. Quality health care must be made available to all in Maryland." Dr. Kingsley added, "Physicians and their patients must be included in the formulation of legislation for health care reform so that quality medical care can be made available to all, and so that cost containment does not occur at the expense of quality, and at the expense of lives."

In addition to physicians, several members of the media attended the rally, including reporters from WMAR-TV (Channel 2), WBFF-TV (Channel 45), Maryland Public Television, *Baltimore Sun, Washington Post, Baltimore Business Journal, The Capitol, Capitol News Service,* and *Prince George's and Montgomery County Journal.* Stories about the rally were also featured by a number of radio stations and local newspapers.



During the rally, several legislators spoke to Med Chi physicians, including Senators Paula C. Hollinger, Arthur Dorman, and Patricia R. Sher, and Senate Finance Committee Chairperson Thomas P. O'Reilly. Senator O'Reilly also answered questions posed by members of the crowd.

More information on the rally and the 1993 legislative session will be featured in an upcoming issue of the *MMJ.*

Angelo T. Troisi, F.A.C.H.E.
Executive Director

Effective cholesterol control

Consistently and significantly reduces total C and atherogenic LDL-C; positively affects other key lipids

*Each arrow represents a range of means derived from a single placebo-controlled study that included 55 patients treated with pravastatin.

PRAVACHOL® (pravastatin sodium) is indicated as an adjunct to diet for the reduction of elevated total and LDL-cholesterol levels in patients with primary hypercholesterolemia (Types IIa and IIb) when the response to diet alone has not been adequate.

Active liver disease *or* unexplained transaminase elevations, pregnancy and lactation are contraindications to the use of pravastatin.

Reference: 1. Jones PH, et al. Once-daily pravastatin in patients with primary hypercholesterolemia: a dose-response study. *Clin Cardiol.* 1991;14:146-151.

PRAVACHOL™

pravastatin sodium 20 mg tablets

Please see CONTRAINDICATIONS, WARNINGS, PRECAUTIONS, and ADVERSE REACTIONS in the brief summary of prescribing information on the adjacent page.

Bristol-Myers Squibb Company

PRAVACHOL® (Pravastatin Sodium Tablets)

CONTRAINDICATIONS

Hypersensitivity to any component of this medication.

Active liver disease or unexplained, persistent elevations in liver function tests (see WARNINGS).

Pregnancy and lactation. Atherosclerosis is a chronic process and discontinuation of lipid-lowering drugs during pregnancy should have little impact on the outcome of long-term therapy of primary hypercholesterolemia. Cholesterol and other products of cholesterol biosynthesis are essential components for fetal development (including synthesis of steroids and cell membranes). Since HMG-CoA reductase inhibitors decrease cholesterol synthesis and possibly the synthesis of other biologically active substances derived from cholesterol, they may cause fetal harm when administered to pregnant women. Therefore, HMG-CoA reductase inhibitors are contraindicated during pregnancy and in nursing mothers. **Pravastatin should be administered to women of childbearing age only when such patients are highly unlikely to conceive and have been informed of the potential hazards.** If the patient becomes pregnant while taking this class of drug, therapy should be discontinued and the patient apprised of the potential hazard to the fetus.

WARNINGS

Liver Enzymes: HMG-CoA reductase inhibitors, like some other lipid-lowering therapies, have been associated with biochemical abnormalities of liver function. Increases of serum transaminase (ALT, AST) values to more than 3 times the upper limit of normal occurring on 2 or more (not necessarily sequential) occasions have been reported in 1.3% of patients treated with pravastatin in the U.S. over an average period of 18 months. These abnormalities were not associated with cholestasis and did not appear to be related to treatment duration. In those patients in whom these abnormalities were believed to be related to pravastatin and who were discontinued from therapy, the transaminase levels usually fell slowly to pretreatment levels. These biochemical findings are usually asymptomatic although worldwide experience indicates that anorexia, weakness, and/or abdominal pain may also be present in rare patients.

As with other lipid-lowering agents, liver function tests should be performed during therapy with pravastatin. Serum aminotransferases, including ALT (SGPT), should be monitored before treatment begins, every six weeks for the first three months, every eight weeks during the remainder of the first year, and periodically thereafter (e.g., at about six-month intervals). Special attention should be given to patients who develop increased transaminase levels. Liver function tests should be repeated to confirm an elevation and subsequently monitored at more frequent intervals. If increases in AST and ALT equal or exceed three times the upper limit of normal and persist, then therapy should be discontinued. Persistence of significant aminotransferase elevations following discontinuation of therapy may warrant consideration of liver biopsy.

Active liver disease or unexplained transaminase elevations are contraindications to the use of pravastatin (see CONTRAINDICATIONS). Caution should be exercised when pravastatin is administered to patients with a history of liver disease or heavy alcohol ingestion (see CLINICAL PHARMACOLOGY: Pharmacokinetics/Metabolism). Such patients should be closely monitored, started at the lower end of the recommended dosing range, and titrated to the desired therapeutic effect.

Skeletal Muscle: Rhabdomyolysis with renal dysfunction secondary to myoglobinuria has been reported with pravastatin and other drugs in this class. Uncomplicated myalgia has also been reported in pravastatin-treated patients (see ADVERSE REACTIONS). Myopathy, defined as muscle aching or muscle weakness in conjunction with increases in creatine phosphokinase (CPK) values to greater than 10 times the upper limit of normal was reported to be possibly due to pravastatin in only one patient in clinical trials (<0.1%). Myopathy should be considered in any patient with diffuse myalgias, muscle tenderness or weakness, and/or marked elevation of CPK. Patients should be advised to report promptly unexplained muscle pain, tenderness or weakness, particularly if accompanied by malaise or fever. **Pravastatin therapy should be discontinued if markedly elevated CPK levels occur or myopathy is diagnosed or suspected. Pravastatin therapy should also be temporarily withheld in any patient experiencing an acute or serious condition predisposing to the development of renal failure secondary to rhabdomyolysis, e.g., sepsis; hypotension; major surgery; trauma; severe metabolic, endocrine, or electrolyte disorders; or uncontrolled epilepsy.**

The risk of myopathy during treatment with lovastatin is increased if therapy with either cyclosporine, gemfibrozil, erythromycin, or niacin is administered concurrently. There is no experience with the use of pravastatin together with cyclosporine. Myopathy has not been observed in clinical trials involving small numbers of patients who were treated with pravastatin together with niacin. One trial of limited size involving combined therapy with pravastatin and gemfibrozil showed a trend toward more frequent CPK elevations and patient withdrawals due to musculoskeletal symptoms in the group receiving combined treatment as compared with the groups receiving placebo, gemfibrozil, or pravastatin monotherapy. Myopathy was not reported in this trial (see PRECAUTIONS: Drug Interactions). One patient developed myopathy when clofibrate was added to a previously well tolerated regimen of pravastatin; the myopathy resolved when clofibrate therapy was stopped and pravastatin treatment continued. **The use of fibrates alone may occasionally be associated with myopathy. The combined use of pravastatin and fibrates should generally be avoided.**

PRECAUTIONS

General: Pravastatin may elevate creatine phosphokinase and transaminase levels (see ADVERSE REACTIONS). This should be considered in the differential diagnosis of chest pain in a patient on therapy with pravastatin.

Homozygous Familial Hypercholesterolemia. Pravastatin has not been evaluated in patients with rare homozygous familial hypercholesterolemia. In this group of patients, it has been reported that HMG-CoA reductase inhibitors are less effective because the patients lack functional LDL receptors.

Renal Insufficiency. A single 20 mg oral dose of pravastatin was administered to 24 patients with varying degrees of renal impairment (as determined by creatinine clearance). No effect was observed on the pharmacokinetics of pravastatin or its 3α-hydroxy isomeric metabolite (SQ 31,906). A small increase was seen in mean AUC values and half-life (t1/2) for the inactive enzymatic ring hydroxylation metabolite (SQ 31,945). Given this small sample size, the dosage administered, and the degree of individual variability, patients with renal impairment who are receiving pravastatin should be closely monitored.

Information for Patients: Patients should be advised to report promptly unexplained muscle pain, tenderness or weakness, particularly if accompanied by malaise or fever.

Drug Interactions: *Immunosuppressive Drugs, Gemfibrozil, Niacin (Nicotinic Acid), Erythromycin:* See WARNINGS: Skeletal Muscle.

Antipyrine: Clearance by the cytochrome P450 system was unaltered by concomitant administration of pravastatin. Since pravastatin does not appear to induce hepatic drug-metabolizing enzymes, it is not expected that any significant interaction of pravastatin with other drugs (e.g., phenytoin, quinidine) metabolized by the cytochrome P450 system will occur.

Cholestyramine/Colestipol: Concomitant administration resulted in an approximately 40 to 50% decrease in the mean AUC of pravastatin. However, when pravastatin was administered 1 hour before or 4 hours after cholestyramine or 1 hour before colestipol and a standard meal, there was no clinically significant decrease in bioavailability or therapeutic effect. (See DOSAGE AND ADMINISTRATION: Concomitant Therapy.)

Warfarin: In a study involving 10 healthy male subjects given pravastatin and warfarin concomitantly for 6 days, bioavailability parameters at steady state for pravastatin (parent compound) were not altered. Pravastatin did not alter the plasma protein-binding of warfarin. Concomitant dosing did increase the AUC and Cmax of warfarin but did not produce any changes in its anticoagulant action (i.e., no increase was seen in mean prothrombin time after 6 days of concomitant therapy). However, bleeding and extreme prolongation of prothrombin time has been reported with another drug in this class. Patients receiving warfarin-type anticoagulants should have their prothrombin times closely monitored when pravastatin is initiated or the dosage of pravastatin is changed.

Cimetidine: The $AUC_{0\text{-}12hr}$ for pravastatin when given with cimetidine was not significantly different from the AUC for pravastatin when given alone. A significant difference was observed between the AUC's for pravastatin when given with cimetidine compared to when administered with antacid.

Digoxin: In a crossover trial involving 18 healthy male subjects given pravastatin and digoxin concurrently for 9 days, the bioavailability parameters of digoxin were not affected. The AUC of pravastatin tended to increase, but the overall bioavailability of pravastatin plus its metabolites SQ 31,906 and SQ 31,945 was not altered.

Gemfibrozil: In a crossover study in 20 healthy male volunteers given concomitant single doses of pravastatin and gemfibrozil, there was a significant decrease in urinary excretion and protein binding of pravastatin. In addition, there was a significant increase in AUC, Cmax, and Tmax for the pravastatin metabolite SQ 31,906. Combination therapy with pravastatin and gemfibrozil is generally not recommended.

In interaction studies with *aspirin, antacids* (1 hour prior to PRAVACHOL), *cimetidine, nicotinic acid,* or *probucol,* no statistically significant differences in bioavailability were seen when PRAVACHOL (pravastatin sodium) was administered.

Other Drugs: During clinical trials, no noticeable drug interactions were reported when PRAVACHOL was added to: diuretics, antihypertensives, digitalis, converting-enzyme inhibitors, calcium channel blockers, beta-blockers, or nitroglycerin.

Endocrine Function: HMG-CoA reductase inhibitors interfere with cholesterol synthesis and lower circulating cholesterol levels and, as such, might theoretically blunt adrenal or gonadal steroid hormone production. Results of clinical trials with pravastatin in males and post-menopausal females were inconsistent with regard to possible effects of the drug on basal steroid hormone levels. In a study of 21 males, the mean testosterone response to human chorionic gonadotropin was significantly reduced ($p<0.004$) after 16 weeks of treatment with 40 mg of pravastatin. However, the percentage of patients showing a ≥50% rise in plasma testosterone after human chorionic gonadotropin stimulation did not change significantly after therapy in these patients. The effects of HMG-CoA reductase inhibitors on spermatogenesis and fertility have not been studied in adequate numbers of patients. The effects, if any, of pravastatin on the pituitary-gonadal axis in pre-menopausal females are unknown. Patients treated with pravastatin who display clinical evidence of endocrine dysfunction should be evaluated appropriately. Caution should also be exercised if an HMG-CoA reductase inhibitor or other agent used to lower cholesterol levels is administered to patients also receiving other drugs (e.g., ketoconazole, spironolactone, cimetidine) that may diminish the levels or activity of steroid hormones.

CNS Toxicity: CNS vascular lesions, characterized by perivascular hemorrhage and edema and mononuclear cell infiltration of perivascular spaces, were seen in dogs treated with pravastatin at a dose of 25 mg/kg/day, a dose that produced a plasma drug level about 50 times higher than the mean drug level in humans taking 40 mg/day. Similar CNS vascular lesions have been observed with several other drugs in this class.

A chemically similar drug in this class produced optic nerve degeneration (Wallerian degeneration of retinogeniculate fibers) in clinically normal dogs in a dose-dependent fashion starting at 60 mg/kg/day, a dose that produced mean plasma drug levels about 30 times higher than the mean drug level in humans taking the highest recommended dose (as measured by total enzyme inhibitory activity). This same drug also produced vestibulocochlear Wallerian-like degeneration and retinal ganglion cell chromatolysis in dogs treated for 14 weeks at 180 mg/kg/day, a dose which resulted in a mean plasma drug level similar to that seen with the 60 mg/kg dose.

Carcinogenesis, Mutagenesis, Impairment of Fertility: In a 2-year study in rats fed pravastatin at doses of 10, 30, or 100 mg/kg body weight, there was an increased incidence of hepatocellular carcinomas in males at the highest dose ($p<0.01$). Although rats were given up to 125 times the human dose (HD) on a mg/kg body weight basis, their serum drug levels were only 6 to 10 times higher than those measured in humans given 40 mg pravastatin as measured by AUC.

The oral administration of 10, 30, or 100 mg/kg (producing plasma drug levels approximately 0.5 to 5.0 times human drug levels at 40 mg) of pravastatin to mice for 22 months resulted in a statistically significant increase in the incidence of malignant lymphomas in treated females when all treatment groups were pooled and compared to controls ($p<0.05$). The incidence was not dose-related and male mice were not affected.

A chemically similar drug in this class was administered to mice for 72 weeks at 25, 100, and 400 mg/kg body weight, which resulted in mean serum drug levels approximately 3, 15, and 33 times higher than the mean human serum drug concentration (as total inhibitory activity) after a 40 mg oral dose. Liver carcinomas were significantly increased in high-dose females and mid- and high-dose males, with a maximum incidence of 90 percent in males. The incidence of adenomas of the liver was significantly increased in mid- and high-dose females. Drug treatment also significantly increased the incidence of lung adenomas in mid- and high-dose males and females. Adenomas of the eye Harderian gland (a gland of the eye of rodents) were significantly higher in high-dose mice than in controls.

No evidence of mutagenicity was observed *in vitro*, with or without rat-liver metabolic activation, in the following studies: microbial mutagen tests, using mutant strains of *Salmonella typhimurium* or *Escherichia coli;* a forward mutation assay in L5178Y TK +/− mouse lymphoma cells; a chromosomal aberration test in hamster cells; and a gene conversion assay using *Saccharomyces cerevisiae*. In addition, there was no evidence of mutagenicity in either a dominant lethal test in mice or a micronucleus test in mice.

In a study in rats, with daily doses up to 500 mg/kg, pravastatin did not produce any adverse effects on fertility or general reproductive performance. However, in a study with another HMG-CoA reductase inhibitor, there was decreased fertility in male rats treated for 34 weeks at 25 mg/kg body weight, although this effect was not observed in a subsequent fertility study when this same dose was administered for 11 weeks (the entire cycle of spermatogenesis, including epididymal maturation). In rats treated with this same reductase inhibitor at 180 mg/kg/day, seminiferous tubule degeneration (necrosis and loss of spermatogenic epithelium) was observed. Although not seen with pravastatin, two similar drugs in this class caused drug-related testicular atrophy, decreased spermatogenesis, spermatocytic degeneration, and giant cell formation in dogs. The clinical significance of these findings is unclear.

Pregnancy: Pregnancy Catagory X: See CONTRAINDICATIONS.

Safety in pregnant women has not been established. Pravastatin was not teratogenic in rats at doses up to 1000 mg/kg daily or in rabbits at doses of up to 50 mg/kg daily. These doses resulted in 20x (rabbit) or 240x (rat) the human exposure based on surface area ($mg/meter^2$). However, in studies with another HMG-CoA reductase inhibitor, skeletal malformations were observed in rats and mice. PRAVACHOL (pravastatin sodium) should be administered to women of child-bearing potential only when such patients are highly unlikely to conceive and have been informed of the potential hazards. If the woman becomes pregnant while taking PRAVACHOL (pravastatin sodium), it should be discontinued and the patient advised again as to the potential hazards to the fetus.

Nursing Mothers: A small amount of pravastatin is excreted in human breast milk. Because of the potential for serious adverse reactions in nursing infants, women taking PRAVACHOL should not nurse (see CONTRAINDICATIONS).

Pediatric Use: Safety and effectiveness in individuals less than 18 years old have not been established. Hence, treatment in patients less than 18 years old is not recommended at this time. (See also PRECAUTIONS: **General**.)

ADVERSE REACTIONS

Pravastatin is generally well tolerated; adverse reactions have usually been mild and transient. In 4-month long placebo-controlled trials, 1.7% of pravastatin-treated patients and 1.2% of placebo-treated patients were discontinued from treatment because of adverse experiences attributed to study drug therapy; this difference was not statistically significant. In long-term studies, the most common reasons for discontinuation were asymptomatic serum transaminase increases and mild, non-specific gastrointestinal complaints. During clinical trials the overall incidence of adverse events in the elderly was not different from the incidence observed in younger patients.

Adverse Clinical Events: All adverse clinical events (regardless of attribution) reported in more than 2% of pravastatin-treated patients in the placebo-controlled trials are identified in the table below; also shown are the percentages of patients in whom these medical events were believed to be related or possibly related to the drug:

	All Events %		Events Attributed to Study Drug %	
Body System/Event	Pravastatin (N = 900)	Placebo (N = 411)	Pravastatin (N = 900)	Placebo (N = 411)

*Statistically significantly different from placebo.

The following effects have been reported with drugs in this class:

Skeletal: myopathy, rhabdomyolysis.

Neurological: dysfunction of certain cranial nerves (including alteration of taste, impairment of extra-ocular movement, facial paresis), tremor, vertigo, memory loss, paresthesia, peripheral neuropathy, peripheral nerve palsy.

Hypersensitivity Reactions: An apparent hypersensitivity syndrome has been reported rarely which has included one or more of the following features: anaphylaxis, angioedema, lupus erythematous-like syndrome, polymyalgia rheumatica, vasculitis, purpura, thrombocytopenia, leukopenia, hemolytic anemia, positive ANA, ESR increase, arthritis, arthralgia, urticaria, asthenia, photosensitivity, fever, chills, flushing, malaise, dyspnea, toxic epidermal necrolysis, erythema multiforme, including Stevens-Johnson syndrome.

Gastrointestinal: pancreatitis, hepatitis, including chronic active hepatitis, cholestatic jaundice, fatty change in liver, and, rarely, cirrhosis, fulminant hepatic necrosis, and hepatoma; anorexia, vomiting.

Reproductive: gynecomastia, loss of libido, erectile dysfunction.

Eye: progression of cataracts (lens opacities), ophthalmoplegia.

Laboratory Test Abnormalities: Increases in serum transaminase (ALT, AST) values and CPK have been observed (see WARNINGS).

Transient, asymptomatic eosinophilia has been reported. Eosinophil counts usually returned to normal despite continued therapy. Anemia, thrombocytopenia, and leukopenia have been reported with other HMG-CoA reductase inhibitors.

Concomitant Therapy: Pravastatin has been administered concurrently with cholestyramine, colestipol, nicotinic acid, probucol and gemfibrozil. Preliminary data suggest that the addition of either probucol or gemfibrozil to therapy with lovastatin or pravastatin is **not** associated with greater reduction in LDL-cholesterol than that achieved with lovastatin or pravastatin alone. No adverse reactions unique to the combination or in addition to those previously reported for each drug alone have been reported. Myopathy and rhabdomyolysis (with or without acute renal failure) have been reported when another HMG-CoA reductase inhibitor was used in combination with immunosuppressive drugs, gemfibrozil, erythromycin, or lipid-lowering doses of nicotinic acid. Concomitant therapy with HMG-CoA reductase inhibitors and these agents is generally not recommended. (See WARNINGS: **Skeletal Muscle** and PRECAUTIONS: **Drug Interactions.**)

OVERDOSAGE

There have been no reports of overdoses with pravastatin.

Should an accidental overdose occur, treat symptomatically and institute supportive measures as required.

55% Of The People Who Complete Our Chronic Pain Program Return Immediately To Work.

Our chronic pain rehabilitation program, called Incentives, is one of the best in the country.

Our nationally recognized medical director and team of specialists have developed a comprehensive program that breaks the devastating physical and emotional decline of a chronic pain patient.

In fact, 82% of the people who complete our chronic pain program are employable at discharge. 55% return immediately to work.

For four weeks, your patient stays at our facility undergoing an intensive rehabilitation regime that addresses the root causes of chronic pain. The program covers physical reconditioning to improve flexibility and endurance, behavioral modification, family education and support, work simulation, coping strategies, and reduction of dependence on addictive medication.

It's specialized. It's aggressive. And it's very successful.

So demand the best. Demand our results-driven chronic pain management program. We are CARF accredited, a leader in total case management, and have been recognized as one of the top 10% of all healthcare organizations in the country by the prestigious JCAHO.

OPEN A SEP-IRA UNTIL APRIL 15*

Self-employed?

THERE'S STILL TIME TO SAVE ON 1992 TAXES

T. ROWE PRICE SEP-IRA: AN EASY—AND LOW-COST—RETIREMENT PLAN

If you're a small-business owner or sole proprietor, you have until April 15* to open a SEP–IRA and make tax-deductible contributions for 1992—up to the lesser of 15% of compensation or $30,000 per eligible employee.

Setting up a SEP–IRA is an easy—and low-cost—way to build retirement savings. SEP–IRAs require no annual IRS filing, involve comparatively little paperwork, and their administrative costs are among the lowest of any employer-sponsored retirement plan. You can vary the amount you contribute each year to reflect your company's financial situation. And, if you have 25 or fewer employees, you can offer them a salary-reduction option.

SEP–IRA BENEFITS AT A GLANCE

- April 15 setup deadline*
- Tax-deductible contributions
- Annual contributions up to the lesser of 15% of compensation per participant, or $30,000
- Low administrative costs
- No IRS filing
- Earnings compound tax-deferred
- Salary-reduction feature

The benefit of tax-deferred compounding

Earnings compound tax-deferred in a SEP–IRA. That means your retirement savings increase at a faster rate than they would in a comparable taxable account.

The T. Rowe Price advantage

You can invest SEP–IRA contributions in any of our 33 mutual funds—all **100% no load**. If you prefer to buy or sell individual stocks and bonds for a self-directed SEP–IRA, you can take advantage of our discount brokerage service. And whether your objectives are conservative or aggressive, you'll find T. Rowe Price has the investments to meet your retirement goals and a staff of experts to assist you. In addition, we offer free retirement planning guides to help you achieve a successful retirement.

"People who care for people who need care"

INTRODUCING

NEW

MARYLAND'S ONLY LOW-RISK TAX-FREE BOND FUND

THE T. ROWE PRICE MARYLAND SHORT-TERM TAX-FREE BOND FUND

T. Rowe Price, manager of the largest municipal bond fund in the state, introduces the first mutual fund to combine the tax advantages of Maryland municipal securities with the reduced volatility of short-term bonds. Designed for Maryland investors who want a conservative investment, the Fund offers higher yields than money funds, with less risk than long-term bond funds. And its income is exempt from federal, state, and local taxes—which is important here in Maryland, since you could be losing over one-third of your earnings to taxes.

The significant yield advantage of triple-tax-free investing

Yields on tax-free funds are currently attractive versus those on comparable taxable funds. The chart shows that you could actually earn higher after-tax income investing in a triple-tax-free fund.

Your earnings are higher with tax-frees*

Annual income on an investment of $20,000 if you're in the 31% federal tax bracket, or 37.2% bracket including state and local taxes

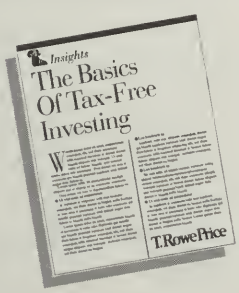
	What you earn		What you pay in federal taxes		What you pay in state and local taxes		What you keep
Taxable fund yielding 5.0%	$1,000	—	$310	—	$62	=	$628
Tax-free fund yielding 3.5%	$700	—	$0	—	$0	=	$700

While earnings from typical taxable investments initially appear to be higher, taxes can subtract a lot. With triple-tax-frees, you keep it all.

The lower risk of short-term securities

Our new Fund invests in short-term securities issued by the state or its agencies, and has an average portfolio maturity of 1–3 years. Longer-term bond funds can generate higher income, but have greater risk. This Fund's short-term securities should be less sensitive to interest rate changes, making it appropriate for those who prefer a more cautious investment approach. Of course, this is a bond fund, so yield and share price will vary.

Visit an Investor Center



Mon.–Fri. 8:30 a.m.–5 p.m.

101 E. Lombard St. (corner of Light and Lombard Sts.)

10090 Red Run Blvd. (near the Owings Mills Mall)

Absolutely no sales charges—100% no load

As with all our funds, the Maryland Short-Term Tax-Free Bond Fund is **100% no load**—no sales charges, no 12b-1 fees, no fees to exchange or redeem. So every dollar you invest goes to work for you. We also provide easy access to your money with free checkwriting. There is a $2,500 minimum investment.

LETTERS TO THE EDITOR

Does Med Chi need a lobbyist?

The response by Dr. Yosuico[1] to my letter of January 25, 1993, about the necessity and propriety of hiring a lobbyist to represent Med Chi is welcomed, but do we need a lobbyist to assist during a transition period? What transition period? Our committees are in place. Many of our members know the legislative process. Our ability to communicate directly to legislators and their committees exists now—just as it will next year.

Hasn't our recent national election emphasized the poor regard the public—our patients—holds for lobbyists? Why can't we act now, promptly and decisively? Money for the lobbyist's salary may have already been committed through a contractual arrangement made by our executive committee and, therefore, has been "lost." Just how much are we paying him? Regardless, we can begin to repair our public image immediately by releasing our lobbyist now.

FRED J. HELDRICH, M.D.
Baltimore, Maryland

Electric shock: A potentially hazardous approach to treating venomous snakebites

The use of electric shock for the treatment of venomous snakebites is not an innovative medical breakthrough. In fact, the use of electric shock for the treatment of venomous snakebites and stings dates back to the 1920s when a number of articles promoted its use in outdoor and sporting magazines. Recently, a highly regarded educational program on the Discovery Channel[tm] advocated carrying a handheld electrical shock device, commonly referred to as a stun gun, when travelling into snake endemic areas (**Figure 1**). The statement made during the program may lead one to deduce that electric shock could be used as a substitute for antivenin to treat a venomous snakebite.

In July of 1986, Guderian et al published a letter in *The Lancet* outlining the successful use of electric shock in the treatment of snakebite among the Waorani Indians of Ecuador.[1] In a study of the same population in 1978, Larrick et al pointed out that 45% of the total population had been bitten previously by venomous snakes, and 50% had been bitten more than once.[2] It is well established that in victims who have sustained one or more bites by the same species of snake, subsequent bites tend to be less severe.[3] Theakston et al also reported in 1981 that in an analysis of 223 samples of serum obtained from the Waorani Indians, over 78% were positive by ELISA (enzyme-linked immunoabsorbent assay) against snake venoms indigenous to that region.[4] As Russell suggested, an argument could be made that Guderian et al were treating a highly selective group of "immune" patients.[5] In addition, Guderian failed to take into account that approximately 25% of all crotalid (pit viper) bites are "dry" and do not result in envenomation.[3]

The mechanisms postulated by Guderian for electric shock are vexatious. He hypothesized that "there may

be a local effect on the host tissues or a direct effect on the activity of the venom." Furthermore, he stated that, "venom has a short half-life, and that electrospasm could shutdown local blood vessels, prevent its absorption, and allow the venom to be inactive."

The venoms of pit vipers stored in the laboratory by Klauber are still as potent today as they were over 60 years ago.[5] In fact, snake venoms are highly complex proteins that have the longest half-life of any known protein substance. Even if electrospasm induced shutdown of local blood vessels, it has been shown that over 90% of pit viper venoms are injected subcutaneously and are absorbed systemically via the lymphatics and not through the bloodstream.[3]

The continued promotional use of electric shock therapy as a successful alternative treatment for snake envenomation is yet another example of anecdotal experiences that have not been subjected to controlled and reproducible experimental studies. Russell already reported an incidence of myocardial infarction in an elderly man following the application of a lead from the coil of an outboard motor boat to treat his rattlesnake bite.[5] There have since been numerous other injuries resulting from the use of lawnmower coils and automobile battery jumper cables. As Bucknall has emphasized, "many people do not realize the difference between amperage and voltage, and may deduce that if 20,000 volts from a stun gun is beneficial, then 12 volts from a car battery is harmless."[6]

Electric shock therapy is a potentially hazardous treatment and merely serves to forestall the only currently accepted standard of treatment for snakebite envenomation—the prompt administration of specific antivenin.

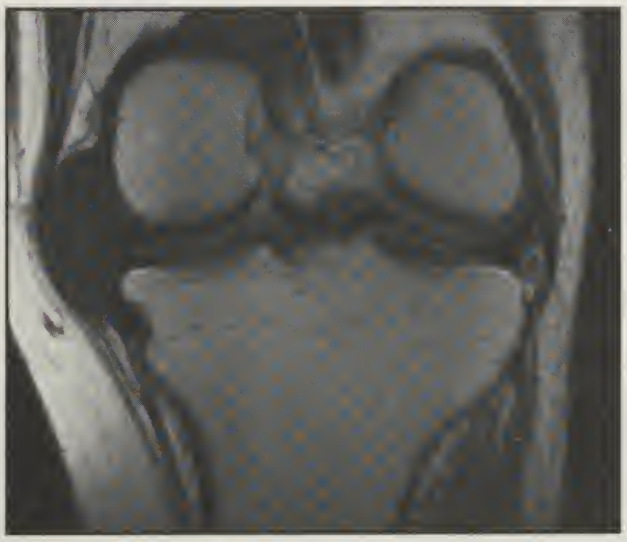
YESTERDAY, TODAY AND TOMORROW

Yesterday Renowned for our consistently high standards, we believe that excellence is never "old fashioned". We developed a laboratory based on high quality, state-of-the-art testing methodologies, personal service, and dedicated patient care.

Today As an industry leader using the most advanced scientific technology, we continue to process your laboratory needs efficiently, quickly and cost effectively. Our skilled staff of pathologists, medical technologists, and hundreds of administrative and support personnel remain dedicated to personal service and personal care.



Tomorrow New technology may bring us an even brighter future, but it will never surpass the human element in our service. Our tradition of caring, and old fashioned pride will never change. Our commitment to excellence will continue to shine brightly in the years ahead.

Still Doing What We're Known For, Only Better.

Sheppard Pratt is known for treating severe and persistent mental illness. While that once may have suggested lengthy or repeated inpatient stays, such a perception would hardly fit Sheppard Pratt today. A full service mental health system, we offer outpatient therapy centers, day hospitals, community rehabilitation programs, and supervised housing in addition to our 322-bed hospital. For patients with schizophrenia or severe dissociative, affective, personality or eating disorders, a hospital stay may be unavoidable. But the Sheppard Pratt advantage is an internal case management function that facilitates movement to a less restrictive treatment setting and return to the referring professional as soon as the patient is ready. We provide a continuum of care within every area of psychiatry:

- Addictions Recovery
- Mood Disorders
- Eating Disorders
- Personality Disorders
- Dissociative Disorders
- Severe and Persistent Mental Illness
- Child and Adolescent Psychiatry (with a K through Grade 12 school on the hospital campus)
- Geropsychiatry

Medicine and the performing arts

John B. DeHoff, M.D., M.P.H.

Dr. DeHoff is chairperson of the Med Chi Committee on Medicine and the Performing Arts.

Performing artists may present with ailments that are superficially familiar, but with subtle differences that may or may not interfere with customary therapies. Standard treatment of a simple respiratory illness, for example, can threaten the career of a vocalist if prescribed or over-the-counter remedies dry the respiratory tract and affect vocal ranges. If excessive rest is prescribed in the treatment of moderate musculoskeletal or radicular pains, an instrumentalist could lose a valuable orchestral position. Dancers, too, are known to suffer the pains of chronic injuries to their backs or lower extremities, rather than seek medical diagnosis and management.

Performing arts medicine and sports medicine have much in common. Harm results from excessive practice habits, and injuries occur during vigorous public performances. Selected portions of a major task may be repeated again and again for perfection. The instrumentalist may use techniques that are incorrect or unwise, or that cause finger or hand disabilities of variable duration. Idiosyncratic hand structure, incorrect positions used to hold wind instruments or instruments that are heavy or large, or even incorrect positions at keyboards may cause intractable pain. Dancers who leap, bend, or hold certain positions must practice strenuously to achieve requisite strength in the back and lower extremities. Beginners may not yet have the joint or ligamentous characteristics that a dance routine requires, and may be seriously disabled if they persist in an unwise practice.

Performers, especially students, must be able to understand and interpret difficult material written for virtuosos even though they may not attain perfection. Strong personal competitiveness is always present, although it is not confrontational as in contact or team sports. Performing artists are simply determined to be near-perfect in their chosen fields, and sometimes harm themselves by excessive practice.

A vocalist may lose a vital range because of chronic gastroesophageal reflux resulting from obesity. A flutist may experience disabling right arm pain. Orofacial pain or a Bell's palsy may cause a brass horn player to "lose his lip," the term used for an impaired embouchure or mouth structure. Violinists may notice impaired hearing in the left ear from their own instrument, or other orchestral sound levels may cause a general hearing loss. Physicians who specialize in performing arts medicine find that they must be especially sensitive to the unusual needs of performing artist patients and their careers. Unless the physician has had personal experience as a performer, the complaints of performing artists may seem

small—even trivial—but they may severely limit abilities to continue training, pursue a career, or achieve success. Expected years of productive, performing, artistic life are variable, from the relatively brief careers of dancers to the longer ones of instrumentalists or vocalists.

Performing arts medicine is a new and growing specialty, with its own professional associations and journals. The various ailments to which performing artists are subject require attention by neurologists, psychiatrists, physical therapists, or surgical specialists such as orthopaedists, otolaryngologists, and hand surgeons. Generalist physicians who know the players in the entourage of large orchestras often are included in road trips to provide general medical support and help select specialist care when needed.

This issue of *MMJ* is designed to introduce physicians to the basic elements of performing arts medicine. Early recognition and treatment of disabilities resulting from faulty practice habits can help eliminate pain that interferes with performance. The articles are based on presentations given at the conference, "Performing Arts Medicine: Issues in Diagnosis and Management," sponsored by the Med Chi Committee on Medicine and the Performing Arts on January 24-25, 1992. Topics include the history of performing arts medicine, informed consent as applied to artist patients, upper extremity disorders, treatment of overuse injuries, stress and the musician, life in the orchestra, instrument modifications, lower extremity problems of dancers, and myofascial pain.

A physician in any type of practice may expect at some time to encounter a performer with a limiting condition. This patient may be an artist who is a child or youth in training; a practicing professional; or a more senior person who plays, sings, or dances for personal enjoyment and achievement. The ancient dictum, *primum non nocere* (first do no harm), applies to the prescription of antihistamines or hormones that can adversely affect a singer's voice range, as well as to general, unfocused recommendations for rest that may harm the fine instrumentalist. Physicians will find the articles in this issue of *MMJ* to be of help when treating performing artists. ■

Selected Music Medicine Clearinghouse holdings

The Med Chi Library has an extensive selection of books and periodicals dealing with performing arts medicine. As a vast number of patients participate in the performing arts on an amateur as well as professional basis, these holdings can provide the practicing physician with valuable information to assist in diagnosis and treatment, as well as prevention of injuries due to the performing arts. For information on clearinghouse holdings, contact Susuan Harman at 410-539-0872 or 800-492-1056.

Odyssey: The history of performing arts medicine

Susan E. Harman, M.S.L.S., M.Ed.

ABSTRACT: *The first publication to summarize the occupational diseases of musicians was Ramazzini's* Diseases of Tradesmen *in 1713. While there was sporadic interest in performing arts medicine during the 1800s, the first book devoted to the subject, Singer's* Diseases of the Musical Profession, *was published in 1932. During the 1960s and 1970s, both physicians and performers became more interested in arts medicine. When pianists Gary Graffman and Leon Fleisher publicly discussed their career-ending hand problems in the early 1980s, a huge, previously unknown group of injured musicians was brought to light. Since that time, publication in the field has dramatically increased, numerous conferences have been held, and clinics catering to the needs to performers have been set up in various large cities. Although we still do not have all the answers to the problems faced by performing artists, arts medicine is now a recognized discipline, reaching out to performers, arts educators, arts administrators, and instrument manufacturers.*

Ms. Harman is associate librarian and coordinator of the Med Chi Music Medicine Clearinghouse, Baltimore, Maryland.

Depending on how one defines performing arts medicine, its history can go back to ancient times with the writings of Hippocrates and Galen on the physiology of the voice. Most experts, however, date the beginning of performing arts medicine to 1713. In that year, Bernardino Ramazzini published *Diseases of Tradesmen,* the first real summary of occupational diseases of musicians.[1]

Through the rest of the 18th and early 19th centuries, interest was sporadic, if publishing is any indication. In the latter part of the 19th century, a number of physicians became interested in musician's cramp as an extension of their work on writer's and telegrapher's cramp. George Vivian Poore, a British physician, did extensive research on what he called "pianist's breakdown."[2] It is interesting to note how closely his descriptions and conclusions resemble those found in today's overuse/focal dystonia disorders.[3]

In 1932, the English translation of *Diseases of the Music Profession: A Systematic Presentation of Their Causes, Symptoms and Methods of Treatment* appeared. Written by Kurt Singer, a German neurologist with an extensive music education, this was virtually the first book devoted to the subject. By today's standards it is outdated, but the book brought all

current knowledge together into one volume. Some of Singer's recommendations, such as rest, are still part of today's treatment program.[4]

Beyond these studies and a few others, it is difficult to locate publications on music medicine prior to computerized or systematic indexing. *Index Medicus,* an indispensable aid for physicians a century ago, listed few citations, English or foreign, between 1876 and 1966, when the National Library of Medicine began computerized indexing.

Surprisingly, from its first issue in 1949, *Music Index* included the subject heading "Occupational diseases and hazards." Most articles indexed in the next decade or two related to dental or vocal problems. Although musical and medical literature continued to be relatively sparse, it showed continued, if small-scale, interest.

The 1960s saw increased interest in hearing loss, perhaps spurred by the growth of rock and roll. Studies were quite contradictory, but many measurements recorded for rock and classical music were beyond standards of the Occupational Safety and Health Administration (OSHA).[5]

During this period, several short items and letters in music journals such as *Strad*[6] and the *Instrumentalist*[7] signaled more serious interest from musicians. Letters usually asked for information from injured musicians or tried to warn musicians of possible dangers. Medical literature began to feature case reports. Several widely read journals, such as the *New England Journal of Medicine*,[8] *British Medical Journal*,[9] and *Lancet*,[10] published numerous reports of occupational problems, often quaintly named. In what may be the first instance of cross-pollination, *Senza Sordino,* the newsletter of the International Conference of Symphony and Opera Musicians, reprinted several of these medical reports almost as soon as they appeared.[11]

By the late 1960s, physicians and musicians were showing a growing interest in performing arts medicine. There was, however, no real cooperation or direction. Several events occurred in the 1970s to focus attention on the field. In 1972, the Voice Foundation first sponsored what became an annual Care of the Professional Voice symposium. Transcripts of presentations by physicians, scientists, speech pathologists, teachers, and performers were published each year.[12]

Also in 1972, the Danube Symposium on Neurology, focusing on the neurology of music, was held in Vienna. As an outgrowth of this conference, *Music and the Brain: Studies in the Neurology of Music* by MacDonald Critchley and R. A. Henson was published in 1977.[13] While this was not a book on music medicine like Singer's, it did include a good deal of information on occupational diseases. Many experts date the birth of the music medicine field from this publication.[14]

Interest escalated during the rest of the decade. The major impetus came from injured performers and health care professionals who puzzled over how to help them. The bulk of physicians, musicians, and the general public was still unaware of any real problem.

In 1981, a *New York Times* article detailed hand difficulties experienced by pianists Gary Graffman and Leon Fleisher, and their frustrating search for solutions. Each eventually arrived at Massachusetts General Hospital, receiving care from a team led by Fred Hochberg, M.D.[15] Though neither found a complete or permanent cure, publicity regarding their experience brought to light a huge, previously unknown group of injured musicians.[16] The first published report of the clinic's experience, in the *Journal of the American Medical Association* in 1983, represented another landmark in performing arts medicine.[17]

During the 1980s, the field advanced rapidly. Another forward step was taken with the staging of conferences. Perhaps the most important was the Medical Problems of Musicians symposium, chaired by Alice Brandfonbrener, M.D., held in conjunction with the Aspen Music Festival in 1983.[18] The Aspen conference has become an annual symposium, now including dance medicine. Other conferences include the Biology of Music Making, the International Society for the Study of Tension in Performance conferences,[19] the International Center for Dance Orthopedics and Dance Therapy symposiums, and the Playing Less Hurt conferences.[20] Besides lectures by health professionals and demonstrations by musicians, these conferences often include presentations by various alternative therapists.

While the United States was perhaps the main center of performing arts medicine activity, there were also developments in Australia. This was mainly due to surgeon Hunter Fry, who surveyed large groups of musicians, developed a grading system for overuse, and published extensively.[21]

A growing number of performing arts medicine clinics were set up. Most are located in large cities with resident orchestras or ballets and are usually staffed by health professionals who are also performers.[22]

All these activities piqued the interest of musicians' unions. In 1985, the International Conference of Symphony and Opera Musicians (ICSOM) included a session on music medicine at its annual meeting.[23] Their newsletter, *Senza Sordino,* published numerous items on performing arts medicine,[24] as did *International Musician,* the newsletter of the American Federation of Musicians.[25]

Experts interested in performing arts medicine set up organizations devoted to the subject. These include the International Arts-Medicine Association (IAMA),[26] Performing Arts Medicine Association (PAMA),[27] Association of Medical Advisors to British Orchestras,[28] MedArt, Hearing Education and Awareness for Rockers (HEAR),[29] and the International Association for Dance Medicine and Science. Existing organizations also recognized the emergence of performing arts medicine. For example, the American College of Occupational and Environmental Medicine,[30] and the National Flute Association created sections or committees concerned with the topic.[31]

The time seemed right to launch a journal devoted to performing arts medicine. In 1986, *Medical Problems of Performing Artists (MPPA)* began publication with Alice Brandfonbrener, M.D. as editor. The journal's major purposes were to promote interest in performing arts medicine, stimulate research, and disseminate information.[32] Having a journal dedicated to the subject put the stamp of legitimacy on performing arts medicine as a specialty.

Besides publishing papers from the Aspen symposiums, *MPPA* provided a forum for an astonishing array of physicians,

allied health professionals, musicians, and alternative therapists. Many early articles detailed health problems prevalent among various subpopulations of performers. By 1988, one of the first articles on incidence appeared in *MPPA*.[33]

Perhaps one of the most important and certainly most quoted articles from *MPPA* concerns the ICSOM survey—a 1986 survey of each player in the 48 member orchestras. This survey will provide continuing study information for some time.[34]

While *MPPA* might be considered the premier journal in the field, it is not the only place progress is reported. The *Journal of Voice* began publication in 1987 and includes transcripts from Voice Foundation symposiums. Other journals focusing at least partially on arts medicine include *Kinesiology and Medicine for Dance* and the new *International Journal of Arts-Medicine*. In 1989, a review of the field by Alan Lockwood, M.D. appeared in the *New England Journal of Medicine*.[35] For many physicians, coverage in this prestigious journal signaled the arrival of performing arts medicine as a specialty.

In the 1990s, there is further evidence of this. The *Textbook of Performing Arts Medicine* is the first modern, comprehensive textbook on the topic. Published by Raven Press in 1990, it is edited by Robert Sataloff, M.D., Alice Brandfonbrener, M.D., and Richard Lederman, M.D., and includes chapters by foremost experts in the field.[36]

Publication in general has increased some 400% since Singer's book. Articles can be found in journals ranging from *People*[37] to *Journal of the Audio Engineering Society*.[38] It is not unusual to see performing arts medicine highlighted on television.[39]

The emphasis of publication and research is shifting toward prevention. This has lead to increased outreach by health professionals to performers, arts educators, instrument manufacturers, arts administrators, and other related groups.

We still do not have answers to all the problems performing artists face, but events of the last 10 years show that a body of knowledge is accumulating. It is the responsibility of experts in the field to pass this knowledge on to the next generation.

Upper extremity disorders in performing artists

Leo M. Rozmaryn, M.D.

ABSTRACT: *Studies in the past decade have shown that a significant proportion of instrumentalists report musculoskeletal problems severely affecting their musical performance. Musicians endure daily intensive use of their upper extremities, frequently placing them in bizarre positions. Their training schedules are rigorous and long term Predisposing factors to, and treatment for, overuse syndromes, tendinitis, and tendon trauma commonly encountered by musical performers are discussed at length. Nerve entrapment has also surfaced as a major problem in musicians, and the means of evaluation and treatment and the role of surgery are put forth. Techniques for studying and analyzing the difficulties faced by instrumentalists are summarized.*

Dr. Rozmaryn is an orthopaedic and hand surgeon in Rockville, Maryland, and a member of the Med Chi Committee on Medicine and the Performing Arts.

Performing arts medicine is a distinct subset of occupational medicine. Its direct applications to upper extremity disorders of performing artists stem from approximately two decades of experience in dealing with special problems of athletes in sports medicine. Musicians, due to the nature of their vocation, present with an array of specialized problems. As a result of developing and maintaining a musical career, performers endure daily intensive use of their upper extremities, often placing them in bizarre positions. Performers frequently bear the weight of instruments on both hands with intense repetitive use of fingers, wrists, elbows, and shoulders. Speed and accuracy are of the essence. There is a strong element of competitiveness and an extraordinarily high demand on them.

While many sports careers end when athletes are in their late thirties or early forties, a musical career usually spans a lifetime of 70 or 80 years. Historically, musicians have been extremely misunderstood; for the most part, this is still true, but it is changing. Musicians frequently present to the uninitiated health care provider with a "mild injury." These mild injuries, however, may be potentially career-ending to the performer. A performer's skills are rarely transferrable to other fields, which may result in anxiety and depression. As opposed to many other occupational injuries, there is no secondary gain and these patients are fiercely driven to return to work. Litigation, workers' compensation, and malingering are rare in this group. Training schedules are rigorous and long-term, and there is a continuously increasing neuromuscular learning curve in this

setting. Even a mild injury can set musicians off from most of their repertoire.

Historically, there has been a lack of communication between the musician and physician. Frequently, the difficulty is simple jargon. Physical findings may be sparse and easily missed by the physician, especially those without a musical background. There is a need to watch musicians play, as symptoms may appear only during a performance. Even slight neuromuscular weaknesses can render finger joints unstable. Technical idiosyncracies can confound the evaluation of dystonia, compressive neuropathy, or overuse syndrome. There have been misconceptions on the part of the medical community that musicians are overemotional and that many of the presenting symptoms are psychosomatic. As more is learned, many problems are coming into sharper focus, and appropriate diagnosis and treatment are more frequently made today.

To date, relatively few epidemiologic studies have been conducted on this group of patients. The work has been primarily retrospective and descriptive, and little analytical work has been done to delineate problems. This too, however, is slowly changing. In 1988, Manchester[1] examined 246 university students and found 8.5 episodes of performance-related pain per 100 musicians. The male to female ratio was 2:1, and the keyboard/string to woodwind/brass ratio was 3:1. Tendinitis was seen in 16%. Overuse was seen in 50%. Seventy-one had an identifiable cause of performance-related pain, including increased playing time and changes in techniques and repertoire. Stress was a vital factor as problems increased close to recital times, in early fall at the beginning of the semester, and in late spring close to performance evaluations. These maladies occurred primarily in the 25- to 35-year-old age range, with hand and wrist problems encompassing 41% of the problems; neck, 38%; shoulder, 35%; forearm, 11%; and elbow, 10%.

In 1986, Martin Fishbein[2] surveyed 4,025 musicians. The response rate was 55%. Fifty-eight of the respondents reported musculoskeletal problems severely affecting performance, females more frequently than males. String players experienced greater difficulties than woodwind or brass. Of 1,378 string players, 10% had hand problems, primarily in the left hand. Wrist, forearm, and elbow problem distribution, however, was equal between left and right.

There is increased incidence of neck and shoulder problems in violinists and violists compared with cello and bass players. Seventy-five percent of pianists experienced right hand problems, while 34% had bilateral problems. Seventy-five percent of string instrumentalists had left hand problems, while 13% of flute and plucking instrumentalists experienced bilateral problems. Seventy-nine percent of woodwind instrumentalists had problems due to direct pressure on the right thumb. Forty-eight percent had entrapment neuropathy, 27% had overuse injury, and 15% had movement disorder.

Overuse syndromes

In 1992, Bengston and Schutt[3] reviewed a retrospective series of 73 musicians and found musicians' most common presenting diagnoses were overuse syndrome, tendinitis, focal dystonia, and nerve entrapment. This review will focus on overuse syndrome, tendinitis, and nerve entrapment in the upper extremities.

Lederman[4] described overuse syndrome as a constellation of symptoms associated with activity that exceeds the tissue's biological limits and leads to motor dysfunction. The most common symptoms are pain, weakness, tingling, fatigue, stiffness, and decreased dexterity.

Three concepts have been proposed to explain the cause of musculotendinous overuse. The first, advanced by Fry,[5] involves injury to muscles, tendons, ligaments, and joint capsules, and tendon sheath inflammation. Lederman[4] advocated the concept of injury to the musculotendinous junction secondary to overstretching of contracting muscles, known as eccentric contraction. Hochberg[6] advocated actual inflammation of the tenosynovium. The true nature of the pathology remains obscure as no pathologic dissection of the upper extremities has yet been done on musicians. What is known regarding overuse syndromes is that there is glycogen depletion in muscle, degeneration in muscle fiber, and edema. There is a relative increase in type I muscle fibers and a decrease in type II muscle fibers. Maximal voluntary contraction is diminished.[7]

A muscle is able to produce maximal work through its contraction when beginning at its resting length.[8] Furthermore, as one increases preload on a given muscle by exerting an external stretch, work capacity of the muscle decreases while potential for fatigue and eventual failure increases. Failure of muscle tendon units as a result of overuse usually can be detected at the musculotendinous junction.[9] Chronic submaximal stress may cause microtears at this junction, evoking a painful inflammatory response.

Predisposing factors include intrinsic and extrinsic phenomena. Intrinsic factors include the performer's physical strength, flexibility, size, anatomic variations, performing level, and playing style. For example, a long neck may present problems for violinists and violists. Small hands may get injured handling large instruments or playing pieces by Rachmaninoff, Paganini, Brahms, or Liszt. Many of these works were written for performers with large hands and hyperextensible joints. Hyperextensible joints, however, may be a problem since increased muscular effort is required to stabilize the distal joints of the hand, and this may cause musculotendinous overuse.

Extrinsic factors, such as time and intensity of playing or size and shape of the instrument, may affect the distribution of work load to the muscle groups involved. A sudden increase in practice time and intensity may stress and diffusely increase muscle tone. There may be a sudden change in technique, teacher, or instrument. Poor practice technique is also a culprit. Excessive repetition to master particularly difficult passages in a long program or continuous repetition of an entire program to learn the whole piece at once may be disastrous. A sudden change in repertoire—such as when a musician accustomed to the closed finger position of Mozart is suddenly confronted with the wide finger stretches of Brahms or Liszt—may also be detrimental. Music students may be misled into believing a

world-class career awaits them if they practice, when this may not be the case.

Tendinitis, tendon trauma, and overuse injuries

Tendinitis is a misused and overused term that does not truly point to an underlying pathologic condition. In the past, this constellation of problems has been called tenovaginitis, peritendinitis, tenosynovitis, intersection syndrome, deQuervain's syndrome, trigger finger, epicondylitis, rotator cuff impingement, repetitive strain disorder, cumulative trauma disorder, and tendon overuse injuries. These eponyms confuse patients and health care providers. Recent anatomic and pathologic studies classify this general condition into various subtypes:[10]

1. **Peritendinitis** describes an inflammation of the epitenon (outer layer of the tendon and its investing synovial sheath). The tissues present with local swelling, pain, crepitation, warmth, or generalized dysfunction.
2. **Peritendinitis with tendinosis** adds intratendonous degeneration with loss of collagen fiber orientation, scattered vascular ingrowth without obvious tendon inflammation, and tendon nodules.
3. **Tendinosis** describes intratendonous degeneration due to aging of microtrauma. It is noninflammatory and may present with nodule formation. This represents a loss of normal collagen fiber orientation and increased cellularity. This is also noted as mucoid degeneration.
4. **Tendinitis** is symptomatic tendon degeneration with an inflammatory response. This may be acute, subacute, or chronic, and can superimpose underlying tendinosis.

In any given situation, several processes may be operating at once. Patients present symptoms of focal pain, snapping, popping, swelling, tenderness, diminished dexterity, and occasional erythema. Initially, symptoms are mild and usually ignored. Symptoms may appear only during execution of specific techniques, such as seen in pianists playing octaves, chords, trills, and arpeggios. These involve wide finger stretches or chronic repetitive activity. Violinists or violists playing in higher positions require long finger stretches, chronic repetitive finger movement with the wrist in maximal flexion, supination, and ulnar deviation. Vibrato accentuates the problem. Symptoms frequently begin in the dorsum of the wrist and forearm, the origin of the extensor carpi radialis brevis at the lateral epicondyle of the humerus (tennis elbow), and the first dorsal extensor compartment known as deQuervain's syndrome.

Dorothy Taubman[11] described a scenario in pianists in which digital extensors may be affected because the hand is too close to the keyboard, necessitating metacarpophalangeal hyperextension with each finger stroke, which causes fatigue most commonly in the ring finger. On the flexor surface, digital flexors peritendinitis and tendinosis may cause painful digital or thumb triggering, although poor conditioning in athletes has been mentioned as a factor in tendon injury. In athletes, there are no objective criteria; the condition is probably multifactorial, having much to do with underlying tendon composition and duration and intensity of overload.

In 1986, Fry graded symptoms in five stages:[12]

- **Stage 1.** Pain at one site that is induced by playing and ceases after stopping
- **Stage 2.** Pain induced by playing, associated with weakness and loss of control
- **Stage 3.** Pain persisting after playing and induced by other activities
- **Stage 4.** Pain with activities of daily living
- **Stage 5.** Severe pain with no function

Performing artists may find themselves canceling performances, shortening practice times, and exhibiting serious deterioration in the ability to play. In many instances this problem may be self-limiting, but a significant number of days, months, or even years may pass before the musician seeks help. By this time, the patient is in deep despair.

Treatment of overuse injuries

As indicated by Fry[12] in 1986, treatment includes rest from all activities that initiate or perpetuate pain. This may include reducing the playing schedule and modifying harmful practice and performance techniques. The amount and quantity of rest may relate to the severity of symptoms. Initially, rest may include a short period of splinting, systemic or topical anti-inflammatories, and physical therapy that may emphasize thermal modalities, heat or ice, or iontophoresis. A program of stretching and strengthening exercises should begin very gently and slowly. Gentle passive, active, and active-assist range of motion exercises should slowly progress to resistive exercises. In selected refractory cases, local cortisone injection may be indicated. Rarely, surgery may be required. Modifications to activities of daily living are helpful. Some activities unrelated to performance perpetuate symptoms. A common aspect of physical training is the performance of specific exercises to stretch out the muscle-tendon complexes most involved in a given activity.

The efficacy of a muscle-stretching regimen to prevent injury and increase efficiency of performance has been well demonstrated by athletes.[13] The same is undoubtedly true for musicians. Stretching increases muscle flexibility, maintains range of motion, and increases the strength of the musculotendinous unit, permitting it to more efficiently store energy and contract. It is critical to return to playing slowly. Early overuse can be detrimental physically and psychologically and may ultimately delay return to full performance.

It has been well shown in the laboratory that immobilization deconditions muscles, tendons, and ligaments. Human muscle biopsy studies show that type I muscle fibers atrophy with immobilization.[14] Their cross section decreases, and the potential for oxidative enzyme activity is reduced. Aerobic capacity of the muscle fibers rapidly decreases, primarily in fiber types affected by the chosen sport. For example, type I (slow twitch) fibers are affected in marathon runners, while type II (fast twitch) fibers are affected in athletes engaged in activities that require speed.[15] The same is true for performing artists.

A progressive program of stretching, strengthening, and conditioning is initiated. Prior to muscular exercise, prestretching increases efficiency and work capacity of the contractile components of skeletal muscle. Heat also causes greater enzymatic activity and less metabolism, increasing the efficiency of muscle contraction. There is also an increase in collagen elasticity and the force production capacity of muscle. Essentially, this is the basis of the warm-up.

Many programs have been proposed for return to playing. For example, in 1991, Richard Norris recommended starting with slow, easy pieces and gradually progressing to faster, more difficult ones. Some musicians start with two 5-minute intervals separated by a 60-minute rest interval, progressing over a period of 30 to 70 days to a maximum of 50 minutes of playing with a minimum of 10 minutes rest in between. Others start with 2 minutes per day for two days, accelerating to 3 minutes daily up to 25 minutes with 5-minute breaks. The common denominator is the onset of a rest period at the first sign of fatigue. Many high-pressure professionals are unable to initiate complete rest for a period of 12 weeks as recommended. They may start with two weeks of complete rest and then a graded return.[16]

Close attention must be given to instrument design and the elimination of maladaptive playing styles. This must be done under the auspices of an experienced music instructor. For example, Dorothy Taubman[11] observed that playing piano with curled fingers is clearly more stressful than playing with straight fingers. Great masters like Vladimir Horowitz discovered this on their own, and Horowitz played with straight fingers his whole life. Striking a piano key is primarily a flexion of the metacarpophalangeal joint. Doing so with the proximal and distal interphalangeal joints flexed pre-stresses and strains the intrinsic muscles, causing extrinsic contraction to the lumbricals and interossei. This predisposes muscle tendon units to fatigue and injury. Attention must be turned toward the correcting of improper posture and the economy of muscle action in the upper extremity, eliminating unnecessary and inefficient muscle contractions. This is the basis of the Alexander[17] and Feldenkrais[18] techniques. Usually, with distal overuse, proximal upper extremity musculature is neglected and needs to be stretched, strengthened, and conditioned, including the trapezius, rhomboids, supraspinatus, serratus anterior, and levator scapular muscles. Paraspinal muscles in the neck need to be addressed also.

Extremity or instrumental orthotics may unload compressed areas, allowing instrument weight to be borne by more proximal muscle groups, such as the trunk or the floor. This facilitates playing by allowing the neck or upper extremity to be placed in a more comfortable position. Occasionally, the instrument's shape may be altered to facilitate playing. This may range from playing with a lighter viola to playing with a curved flute. A custom-molded chin and clavicle rest for the violin or viola may make supporting the instrument with the head and neck effortless, reducing the necessity for extreme neck flexion or anterior rotation of the shoulder girdle, which lead to fatigue, pain, and neuropathy. Significant comfort can be achieved by simple modification without compromising performance quality. In general, with appropriate treatment, 60% to 90% of these musicians eventually return to full performance schedules.[19]

Nerve entrapment syndromes

Initially thought to be rare in musicians, nerve entrapment syndromes have surfaced as a major problem. Twenty percent of patients presenting with upper extremity complaints to performing arts clinics in this country have compressive neuropathies.

As peripheral nerves travel from the intervertebral foramen to sensory receptors or motor endplates, they pass through anatomically tight spaces at various levels in the extremity. These spaces are bounded by fibrous tissue and or bone. Peripheral nerves slide back and forth as extremities flex and extend at various joints. For example, chronic repetitive movement of the arm in positions that increase overall pressure in these fiber osseous tunnels leads to local ischemia of the nerve and myelin nerve sheath. Secondary inflammation accentuates the problem, causing formation of a constricting scar around these fibrous tunnels and creating intrafascicular edema within the nerve. If this continues, writing becomes jeopardized and the nerve becomes tethered, causing microtears and stretching injuries. This may cause demyelination, which may or may not be reversible. Musicians are particularly susceptible to this type of nerve injury.

Maintenance of stressful, proximal muscle girdle postures, while executing rapid finger movement, may cause this problem in violinists and violists. Cervical nerve roots become compressed by bone or disc material that escapes into the intervertebral foramen, where cervical roots exit. Another source of compression is degenerative joint disease in the neck. This is common in violinists because of the tendency to have their necks flexed and turned to the left side.

At the brachial plexus level, nerves may become compressed by a cervical rib or under the tendon of the pectoralis minor, known as thoracic outlet syndrome. More distally, the ulnar nerve may be compressed at elbow level (cubital tunnel syndrome) or at the wrist's canal of Guyon. At the same time, the median nerve can be trapped in the elbow's pronator inlet, or more commonly, in the wrist's carpal tunnel. The radial nerve compresses in the radial tunnel of the proximal forearm. This may present with motor palsy of the posterior interosseus nerve or a pain syndrome known as radial tunnel syndrome, which may be associated with tendinitis at the origin of the extensor carpi radialis brevis. Digital nerves may become compressed because of their subcutaneous position. A flute or clarinet may cause direct pressure on the side of the finger, causing nerve compromise. Playing the English horn, while suspending it in the air, may cause ulnar nerve compression secondary to extreme positions of elbow flexion.

Thoracic outlet syndrome in flutists is quite common. Reducing hyperabduction of the right shoulder and diminishing internal rotation of the left shoulder can be quite helpful. Cervical radiculopathy is found in keyboard players primarily on the right side and in violinists on the left side. This is associated with the neck being tilted four to six hours daily.

Symptoms in these conditions include painful numbness

(dysesthesia), weakness, loss of dexterity, and a sense of "swelling or perked circulation." Duration of symptoms varies from several days to years and may be continuous or intermittent. In chronic cases, trophic changes in the hand and arm may result in frank muscle atrophy and complete loss of movement. Discomfort usually begins at a specific site and may radiate proximally and distally on the arm. Multiple nerves may become involved, or a single nerve may be compressed in more than one location (double crush syndrome). Compression of a peripheral nerve in one location may sensitize it, making it more susceptible to compression at another site.[20]

Evaluation of nerve entrapment syndromes

A thorough history must be obtained. Underlying metabolic disorders, such as diabetes, alcoholism, thyroid dysfunction, or rheumatoid disorders, must be elicited. A complete work history, related or not to performing arts, must be sought along with possible old acute trauma. The possibility of primary nerve disease or syringomyelia must not be forgotten. A comprehensive physical examination completes the initial evaluation.

In evaluating performing artists, one must see them in action. I have had musicians play for me in bathing or aerobic exercise attire to fully evaluate posture, position of the neck and shoulder girdle, and relative positions of both arms to the fingertips. If a specific set of movements brings on a symptom, I elicit this directly. I have patients exhibit a broad range of playing techniques. While I do not pretend to be a music instructor, I comment on specific techniques liable to cause muscle tendon strain or nerve compression. A thorough neurological exam includes evaluation of sensory and motor function, reflexes, and the presence or absence of pseudomotor signs, such as skin tone, color changes, sweat patterns, swelling, skin turgor, or rigidity. Sensory function is evaluated by testing sharp/dull perception, two-point discrimination, stereognosis, threshold light touch perception, static and moving two-point discrimination, and vibratory perception and position. Motor function is evaluated by testing specific muscles and muscle groups in the hand, forearm, elbow, upper arm, and neck.

There are a battery of provocative tests that increase the pressure across the particular fiber osseous tunnel one wishes to study. The Phalen's test involves passive wrist flexion at 90 degrees for 45 seconds for the median and ulnar nerve at the wrist. The elbow flexion test involves full supination and flexion of greater than 120 degrees for one minute for the cubital tunnel at the elbow. Supination against resistance or resisted middle finger extension tests for radial tunnel syndrome. One evaluates pronator syndrome by resisted finger flexion and forearm pronation with direct percussion over the anterior elbow. Dysesthesia caused by any of these maneuvers constitutes a positive exam. Tinel's test, involving direct percussion of the nerve at the area of possible compression, is less specific or sensitive. The thoracic outlet may be evaluated by Adson's test—the disappearance of the ipsilateral radial pulse when the involved arm is maximally elevated to shoulder level with the neck tilted and turned in the direction of the arm.

Treatment of nerve entrapment syndromes

Once a clinical diagnosis is made, a period of relative rest and splinting is followed by rehabilitation. A therapist may desensitize the hand and arm with various modalities and facilitate nerve gliding with special exercises. Tendon and ligament stretching exercises are followed by a muscle- strengthening program. Special instructions are given to facilitate activities of daily living. Performance and practice modifications are discussed, and a specific plan for return to play is instituted. Night splinting can continue for several months if needed. Most patients respond well to this protocol. For some, more aggressive treatment may be needed. Other conservative modalities include nonsteroidal anti-inflammatories and oral or injected steroids. With the latter, care must be taken to avoid intratendonous or intraneural injection, which may cause permanent damage.

Thoracic outlet syndrome is usually treated with a vigorous program of stretching and strengthening the anterior and posterior shoulder girdle muscle and paraspinal musculature. Surgery is almost never recommended in thoracic outlet syndrome.

Role of surgery in the treatment of performing artists

Many consider surgery a last resort. Musicians usually present late in the course for surgical treatment. I believe there are several reasons for this:

- Every music teacher or nonsurgical arts medicine practitioner has at least one horror story about a poorly indicated or badly performed operation that resulted in a crippling, career-ending outcome.
- There is general ignorance about potential benefits of well-performed surgery.
- Patients have a fear of being out of control during surgery and think they will never be the same after the operation.

In 1992, Dawson[21] outlined indications for surgical treatment of musicians. They include the release of refractory stenosed tenosynovitis in wrists or digital tendons—deQuervain's syndrome or trigger digits and compressive neuropathy not responsive to conservative measures.

Nonperformance-related conditions may have an impact on performance and may be amenable to surgical correction. I recently treated a pianist for a crippling digital osteoarthritis of the proximal interphalangeal joints with arthrodesis. In a short time, she returned to playing comfortably. She had come to me after several years of playing with significant pain. Prominent music educators told her the problem was poor playing technique and to avoid surgery at all cost.

Other conditions, such as Dupuytren's contracture, have no nonsurgical treatment and, if allowed to progress unimpeded, will end the instrumental musician's career. In many upper-extremity trauma or tumor situations, surgery is the conservative approach. It allows earlier joint mobilization and muscle retraining, facilitating an early return to performing. Surgery is a valuable adjunct in our armamentarium. While it should be used judiciously to achieve maximal benefit, it should never be dismissed.

Techniques of study

Communication is increasing between the conservatory and clinic. The fruits of this ever increasing cooperation are increasingly evident. These issues are being examined in the laboratory as well. Frequently, musicians can demonstrate difficulties to physicians and music teachers simultaneously. Video increases musicians' awareness of the subtleties of their playing techniques, helping musicians correct inefficient movements that can cause a repetitive strain problem. Pioneers, such as Dorothy Taubman, devoted a lifetime to studying playing techniques in the interest of preventing injury and treating already injured musicians.

Ultimately, much of what we will know about these problems will emanate from the laboratory. Over the past 20 years, force transducers, multichannel electromyograms (EMGs), video imagers, computer simulations, biofeedback, and an array of highly sophisticated biomechanical techniques previously used for the analysis of gait and throwing arm are now being focused toward the biomechanical underpinnings of musical technique. In trying to more clearly understand muscle groups involved with such discreet movement, techniques have been adapted for piano, flute, clarinet, brass, and percussion. Increasing attention is also focused toward popular musicians as they slowly enter the fold of music medicine. In coming years, we anticipate a flood of theoretical and practical information to treat injured musicians and, more importantly, to prevent problems.

The musical community needs to understand that they are essentially high-powered athletes. Organized conditioning programs must be a part of musical training on individual and institutional levels. Multidisciplinary approaches toward music education have been very successful in Europe for the past 15 years.

Performing artists need to train muscle groups they use most often and maintain excellent aerobic fitness, similar to professional football players or marathon runners. While demands are different, they are certainly no less stressful. This realization goes a long way in preventing performance-related musculoskeletal problems in musicians.

Med Chi Bicentennial Celebrations

Med Chi has already begun planning celebration activities for its bicentennial in 1999. If you have ideas or suggestions, please call Margaret Burri or Vivian Smith at 410-539-0872 or 1-800-492-1056.

Myofascial pain: The great mimicker and potentiator of other diseases in the performing artist

Norman B. Rosen, M.D.

ABSTRACT: *The performing artist often sustains a variety of neuromusculoskeletal problems that interfere with the ability to play or perform. Although many of these conditions occur as a result of overuse or misuse, other causes should be kept in mind—particularly when pain problems persist, recur, or do not respond to usual therapeutic measures. Chief among these are myofascial pain syndromes. These are quite common but are often overlooked, despite the fact that they can cause, potentiate the dysfunction of, and mimic other conditions. This article presents an overview of myofascial pain and dysfunction—particularly as it pertains to neuromusculoskeletal pain and disability in musicians and performing artists.*

Dr. Rosen is medical director of Rehabilitation and Pain Management Associates of Maryland in Baltimore and chairperson of the Myofascial Pain Special Interest Group of the American Academy of Physical Medicine and Rehabilitation.

The performing artist is often subject to a variety of medical conditions and illnesses that can interfere with the ability to play an instrument and to express artistic skills to their greatest extent.

Among these are conditions involving the neuromusculoskeletal system that can cause pain, cramps, weakness, stiffness, dysesthesia, and loss of agility, coordination, endurance, and control. These problems are usually caused by conditions such as tendinitis, bursitis, entrapment neuropathy, or overuse[1] and misuse syndromes.

Surprisingly, little mention is made in music or sports medicine literature of myofascial pain and dysfunction, even though these syndromes are ubiquitous[2–4] and often coexist with, complicate the management of, or mimic other diagnoses and conditions.[5–6] As a result of clinicians' failure to recognize and understand myofascial pain syndromes, and to correct the underlying dysfunctions, treatment programs are often prolonged or unsuccessful. When conservative treatment fails, surgical intervention is often recommended as the last resort, with predictable "less-than-good" outcomes.[5,7]

For the performing artist—particularly the professional who must excel for financial and professional reasons—slow or failed treatment can have disastrous consequences, resulting in career-ending or career-modifying illnesses. It is critical for the clinician who works with performing artists to clearly understand the underlying pathophysiology and to be aware of the myofascial pain and dysfunction invariably present in most cases of persistent or refractory clinical presentations.

There are two main reasons clinicians fail to recognize and appreciate the significance of myofascial pain syndromes in the pathogenesis of recurring disability. First, diagnosis of myofascial pain and dysfunction is essentially clinical and depends on the assessment and recognition of many subtle physical findings (**Table 1**).[8] In particular, the phenomenon of referred pain and tenderness[8] can often lead the patient and practitioner away from a correct diagnosis. The pain and tenderness may emanate from a remote source, usually a "trigger" point in a distant muscle. The trigger point is so named because of its ability to trigger referred pain and tenderness in remote areas.[8] Just because a tissue is painful or tender does not mean that the tissue is pathologically involved; rather, the pain may be a referred manifestation emanating from another source.[9] Each muscle in the body is capable of developing its own pattern of referred pain and tenderness to other areas of the body.[10] Failure to recognize that local pain and tenderness may be referred from a remote source invariably results in misdiagnosis or misplaced emphasis in treatment. This may even result in inappropriate surgery.[5]

The second major reason for failure to recognize the existence of myofascial pain syndromes is that clinicians often forget that pain and tissue dysfunction are separate clinical problems.[6] Although pain is usually the reason patients seek medical attention, pain and pain perception may be due to factors other than local pathology or tissue dysfunction, and may resolve while underlying tissue dysfunction is only partially corrected. On the other hand, tissue dysfunction may exist independently of pain, and may be manifested by tissue tightness, tissue weakness, restricted range of motion of muscle and joint, agonistic and antagonistic muscle imbalance, or localized muscle dysfunction caused by misalignment of forces; subtle or gross changes in nutritional, metabolic, or other intrinsic or extrinsic environments of the muscle; or neurological or vascular factors.[11] Too often, patients and practitioners settle for pain relief as the primary goal, ignoring residual tissue dysfunction and dismissing it as trivial. Yet, the most common cause of recurring pain and disability is due to the fact that the underlying tissue dysfunctions have not been corrected completely, even though the pain has subsided. The most important goal of successful rehabilitation is not pain relief, but restoration of a normal range of motion to the tissues and the achievement of strength and endurance in all members of the myotatic unit. For the performing artist, achieving these goals is critical for meeting professional and artistic responsibilities, and for avoiding recurring breakdowns.

Table 1. Characteristics of myofascial pain

- History of muscle pain, tenderness, stiffness, aching, gelling, tightness, numbness, tingling, weakness, or coolness
- May be localized or generalized
- Localized areas of muscular ropiness and hardening (taut band)
- Areas of localized tenderness within the taut band (trigger point)
- Compression of the trigger point results in referred pain and tenderness to areas remote from that trigger area; can also cause local tenderness
- Local twitch response elicited on snapping or needling the taut band
- Characteristic pattern of referred pain and tenderness for each trigger point
- Weakness of involved muscle or muscles harboring trigger points (may be subtle)
- Loss of joint range of motion (may be subtle)
- Immediate reversal of weakness and improved range of motion following inactivation of the trigger point
- Autonomic components: Vasoconstriction or vasodilation locally, and vasoconstriction in the area of referral
- Epiphenomena: nerve, tendon, or blood vessel entrapment; deconditioning; psychosocial dysfunction including anxiety, depression, fear of activity (actophobia or kinesophobia)

Two physiological principles support the importance of achieving a full-balanced range of motion across a joint. The first is the concept of "preload stretch," and the second is the concept of "reciprocal relaxation."

Preload stretching of a muscle allows increased strength as a result of a more favorable length-tension relationship. Reciprocal relaxation of the agonist and antagonist allows muscles to rest and recover from work demands, facilitating endurance. Muscles inadequately stretched or unrested lose strength and endurance, predisposing them to premature breakdown.

Unfortunately, many clinicians view residual tightness following treatment as acceptable, despite the fact that this tightness and loss of range of motion set the stage for recurring breakdown and disability. The skillful performing artist often compensates for residual tightness by overloading other tissues, which paradoxically subjects them to premature breakdown and the development of other patterns of dysfunction, complicating the overall clinical picture—particularly when the patient returns with recurring pain and dysfunction following a subsequent "re-injury."

Potentiator and mimicker of other diagnoses

Myofascial pain syndromes, through a variety of physiological mechanisms, can cause alternative diagnoses including tendinitis, bursitis, entrapment neuropathy, overuse syndromes, and even arthritis. In addition, myofascial pain syndromes can co-exist with and potentiate overall dysfunction in the patient with these other diagnoses. They mimic other diagnoses through the mechanism of referred pain and tenderness mentioned earlier. Although the mechanism of referred pain and tenderness is still not clearly defined, there is ample clinical evidence in the literature documenting this manifestation.[8–10,12–16] It is well accepted that areas of myofascial pain trigger unique patterns of referred pain and tenderness to remote tissues. For example, pain and tenderness in the wrist or hand may not be coming from locally sensitive or tender tissues, but from proximal sites, such as muscles of the forearm, shoulder, chest, or neck. Similarly, pain in the lower extremity

allegedly due to sciatica, may not be due to entrapment of the sciatic nerve, but may be occuring as a referred phenomenon from any muscle of the buttock or low back, mimicking true sciatica. Similarly, dysfunction of the shoulder, low back, head, neck, or foot may not be due to local problems such as nerve impingement, disc herniation, arthritis, tendinitis, radiculopathy, or joint degeneration, but may be the result of myofascial pain and dysfunction in more proximal (rarely distal) muscle sites. **Table 2** lists conditions myofascial pain syndromes can cause or mimic.

When faced with these clinical presentations, the clinician should conduct a meticulous search for myofascial dysfunction in the distribution of the area of pain, looking for myofascial foci that cause, mimic, or potentiate these patterns and dysfunctions.

Table 3 summarizes various manifestations of myofascial pain syndromes in terms of local, remote, and autonomic manifestations, and their ability to cause a variety of epiphenomena. These epiphenomena may occur as a result of direct mechanical compression of other tissues by the taut bands locally[9,10] or by causing a host of superimposed physical and emotional deteriorations as a result of deconditioning, fear, pain, and disuse.[17,18]

Autonomy and the spread of dysfunction

Two enigmatic aspects of myofascial pain and dysfunction should be commented on at this time. First is the ability of myofascial pain syndromes to develop an autonomy and persist as independent foci—even though initial contributing factors are no longer present or operant.[8] Although myofascial pain and dysfunction generally occur secondary to other phenomena, once established, they can persist and function autonomously even though the underlying cause is no longer present or active. Successful treatment depends on eradicating the trigger point area and its cause. Treatment of the trigger point alone may not be successful unless causative factors are also eradicated or modified. Conversely, treating the cause of the trigger point without simultaneously eradicating the trigger point itself can also lead to failure. Many cases of persistent pain, including pain following surgery, are due to the failure to eradicate secondary trigger point manifestations in the tissues while eradicating the initial cause of the myofascial dysfunction. Once developed, the same trigger point phenomenon recurs more easily when the patient is exposed to mechanical, structural, hormonal, or emotional sensitizers. Periodic reassessment of the patient with myofascial pain helps ensures that the patient is performing a home exercise program for adequate posture, flexibility, and strength.

The second enigmatic manifestation of myofascial pain is its tendency to seemingly spread, causing dysfunction in remote tissues. It is not yet understood whether this is a reflection of concomitant breakdown in marginally adjusted tissues or breakdown due to referred motor sensitization from an initial focus of irritability, but spread of dysfunction is well appreciated and well documented. Overlapping referred motor and sensory pathways, concurrent deconditioning, and incomplete rehabilitation—alone or in combination—are all explanations for spread of dysfunction.

Table 2. Conditions myofascial pain may cause or mimic

- Headache
  - Migraine
  - Tension
  - Spinal
  - Sinus
  - Temporal
  - Occipital
- Earache
- Temporomandibular (TMJ) joint pain
- Arthritis
- Nerve entrapment
  - Thoracic outlet
  - Ulnar
  - Median
  - Lateral femoral cutaneous
  - Sciatic
  - Peroneal
- Bursitis
- Pericapsulitis
- Radiculopathy
  - Cervical
  - Thoracic
  - Lumbosacral
- Tendinitis
- Muscle injury
- Adhesions
- Failed surgery
- Postsurgical scars and neuromatosis
- Cardiac
- Renal colic
- Bladder or other viscus
- Meniscus tear
- Shin splints
- Compartment syndrome
- Postphlebitic syndrome
- Plantar fasciitis
- Heel pain

Table 3. Manifestations of myofascial pain

- Local manifestations
  - Taut band
  - Trigger point
  - Local twitch response
  - Localized weakness
  - Localized loss of joint range of motion
- Remote manifestations
  - Referred sensory (pain and tenderness)
  - Referred motor (sensitization and spread of dysfunction)
- Autonomic manifestations
  - Local vasoconstriction and/or vasodilation
  - Referred vasoconstriction
- Epiphenomenon
  - Nerve, tendon, or blood vessel entrapment
  - Deconditioning
  - Psychosocial dysfunction (reactive)

The myotatic unit

Muscles do not operate independently. For every prime mover (agonist), there is an antagonistic muscle response that modifies or stabilizes its activity. In addition, a variety of co-movers assist the primary mover in its desired activity. Since all movement, particularly loaded movement, requires some degree of proximal stabilization, other muscles of the synergistic unit, including proximal stabilizers, often are subject to overload phenomena and mechanical or somatic dysfunction. This results not only from overload or overuse but from the mechanisms of referred muscle sensitization discussed earlier, as well as a variety of neurocirculatory influences.[8–10,15–16] All these interactions are

under exquisite central and sympathetic nervous system control, and are dependent on speed, load, and energy. Whether sensitization is mediated through the central nervous system, sympathetic nervous system, or mechanisms involving the myofascial network, the end result is often a spread of dysfunction seemingly independent of the initial event.

The primary cause of musculoskeletal system dysfunction is an imbalance of forces between agonistic and antagonistic muscles. This may or may not involve joints, but whenever there is an imbalance between tissues, they become overloaded and subject to breakdown. Whether this breakdown occurs secondary to improper use or abnormal loads imposed upon muscles or joints incapable of withstanding these "critical loads,"[6] dysfunction occurs when critical load capacity is exceeded, resulting in fatigue and subsequent breakdown (**Table 4**). This occurs as a result of localized changes in the metabolism of specific sarcomeres that are overloaded, injured, or stressed—perhaps as a result of local hypoxia under sympathetic control.[15,16]

Although tissue damage has not been consistently reported on routine muscle biopsies, some changes have been reported on electron microscopic studies, suggesting dysfunction at a microcellular level.[19] Local hypoxia has been postulated to be present at this area of breakdown,[15,16] and thermistor studies reveal increased temperature at dysfunction sites.[9] It is not clear whether this temperature increase is due to stasis from decreased removal of metabolic wastes or secondary to chemical changes occuring at the presumed site of microtrauma. Clearly, however, metabolic distress occurs in the tissues at a localized level.[15,16] Simultaneously, muscle contracture occurs at this area, resulting in a taut band that is palpated clinically. Electron microscope studies show fibers bunching up within the taut band region, and this phenomenon appears to be energy dependent. It may also provide a clue to the treatment of myofascial pain since, by stretching out the taut band, release of tightness can occur.[15]

Other diagnostic considerations

When a condition is misdiagnosed, many other inappropriate diagnoses and labels are often applied to patients with these conditions, particularly when the patients present confusing and widespread complaints. When a clinician is faced with a patient with widespread enigmatic pain and dysfunction that cannot be readily explained, there is an unfortunate tendency to impugn the patient's motivation to wellness or to question his or her psychological balance or need to satisfy secondary gains. Although some patients use musculoskeletal pain as a vehicle to express hidden agendas and secondary needs, it is still necessary to address and resolve these various presentation components to more effectively restore the individual to a functioning lifestyle. Once underlying myofascial pain and dysfunction are recognized and treated, it is easier to unravel the associated emotional or social disability that often accompanies persistent dysfunction.[18] It is critical to recognize and adequately treat the physical and the emotional components in patients with musculoskeletal pain and concurrent emotional lability. It is particularly important to recognize underlying physical disability before ascribing residual disability to emotional factors alone.[5,7,9,10]

Proper diagnosis is further complicated by the fact that, for about 90 years, there has been considerable confusion as to various terminologies used to describe patients with musculoskeletal pain—particularly, diffuse or widespread musculoskeletal pain.[2,15,16,20] The term "fibrositis" was first applied

Table 4. Factors affecting the critical load

- Alignment/structure/posture
- Static and dynamic loading forces
- "Use" syndromes
- Hyperlaxity
- Balance between agonist and antagonist
- Internal milieux and muscle set factors
  - Length/tension relationship
  - Nutrition
  - Energy supply
  - Circulation
  - Sympathetic nervous system
  - Temperature
  - Other perpetuating factors (**Table 7**)
  - Psychosocial modulators
- External milieux factors
  - Physical and emotional stresses
  - Environmental factors
  - Temperature
  - Coexisting entrapment neuropathy

Table 5. Classification of the common muscle pain diseases

- Fibromyalgia, presumed primary disease of muscle
- Myofascial pain syndromes, with or without secondary joint dysfunction
- Primary articular dysfunction with secondary muscular dysfunction
  - Inflammatory
  - Mechanical/structural
  - Autoimmune, connective tissue, vasculitis
  - Infectious
  - Metabolic/endocrine
- Rheumatic pain modulation disorder (sleep deprivation)
- Metabolic, endocrine, electrolyte, or inherited defect
- Infectious
- Inflammatory, autoimmune
- Neurological
- Trauma
- Neoplasm
- Toxic
- Psychogenic, true tension myalgia, conversion reaction, psychophysiological reaction of the musculoskeletal system
- Reactive—tendinitis, bursitis, spasm

to this spectrum of conditions by Gowers in 1904.[21] Fibrositis initially applied to a localized form of musculoskeletal dysfunction in the lower back. Over the years, the term came to include musculoskeletal pain and dysfunction from almost any cause, including true psychophysiological musculoskeletal pain in which no objective lesions could be ascertained. Because of the subtlety of most objective clinical findings in these patients, most textbooks of the 1950s and 1960s considered fibrositis as psychogenic disease. From a current perspective, this is clearly inappropriate. We now recognize multiple subgroups of patients with localized or generalized muscle pain and dysfunction (**Table 5**).

Many experts today only use the term fibrositis in a historical sense.[15] In 1981, Yunus and his coworkers redefined the widespread form of muscle pain as "fibromyalgia,"[22,23] and this term is now accepted as the most appropriate. Localized forms of muscle pain labeled as "myofascial pain syndromes" by Travell and Rinzler in 1952 continue to be viewed as separate conditions. There is, however, still considerable controversy as to whether localized forms of fibrositis are separate conditions or limited forms of the more generalized spectrum of musculoskeletal dysfunction now classified as fibromyalgia. Some researchers still suggest all these conditions reflect psychophysiological distress and are merely conversion reactions with the musculoskeletal system as the target. There are, in fact, patients in whom psychophysiological distress is primary, but this constitutes a small, but challenging, subgroup of chronic pain patients. The vast majority of patients with localized or generalized muscle pain can be subdivided as listed in **Table 5**. Time and space do not permit an in-depth review of this controversy, but it is apparent that the disease formerly known as fibrositis constitutes a very complex differential diagnosis. The clinician should keep this in mind when dealing with a patient with musculoskeletal pain and dysfunction.

Myofascial pain syndromes, as described by Travell and Rinzler in 1952, generally present as single muscle, local, or regional dysfunctions. They may, on occasion, be multifocal or generalized in nature (**Table 6**).[6] When widespread involvement occurs, these syndromes are easily confused with fibromyalgia. It is important to look for so-called perpetuating factors, which include a variety of mechanical, structural, and metabolic conditions, perpetuating underlying myofascial pain and dysfunction (**Table 7**).[9,10] For the most part, myofascial pain syndromes are more responsive to treatment than fibromyalgia, although persistent cases of myofascial pain do exist and are quite challenging.

Muscle, joint, and psychological tension states

That muscular pain occurs in a setting of joint dysfunction has been well documented, particularly in osteopathic and chiropractic literature. There is abundant clinical evidence that, by correcting underlying articular dysfunction, secondary muscle pain is often abolished. There seems to be ample evidence, therefore, to include articular dysfunction with secondary muscle pain as a third category of diffuse muscle pain disease. Psychogenic tension can create primary muscle dysfunction in many individuals. The clinician, however, is cautioned to restrict use of the term "tension myalgia" to that subset of patients in whom true psychic distress is the cause of, rather than reaction to, tissue dysfunction.

Sleep deprivation

In 1984, Dr. Harvey Moldofsky pointed out that chronic sleep deprivation alone can cause generalized muscle pain and widespread tenderness, satisfying current American Rheumatism Association (ARA) criteria for a fibromyalgia diagnosis. In his patients, generalized pain disorder and widespread muscle tenderness was reversed merely by restoration of normal sleep. He coined the phrase "rheumatic pain modulation disorder" to explain this subgroup of patients with symptoms suggesting fibromyalgia, but whose symptoms were purely sleep-related.

Many patients with chronic fatigue syndrome also have generalized point tenderness in multiple areas, satisfying ARA criteria for fibromyalgia, even though pain itself may not be a major component.

Overuse versus overload

In the last decade or so, three additional terms have been applied to patients with focal or regional muscular dysfunction.

Table 6. Classification of myofascial pain syndromes

- Single muscle involvement
- Focal involvement (two or more muscles involved around a single joint)
- Regional involvement (two or more muscles involved and two or more joints involved in a single region of the body)
- Multifocal or multiregional involvement (two or more apparently unrelated regions of the body involved)
- Generalized involvement
  - Primary muscle (fibromyalgia or other inherited genetic defect)
  - Secondary muscle (thyroid deficiency; vitamin deficiency; other hormonal, nutritional or endocrine dysfunction; mechanical; structural; postural; vasculitis; sleep deprivation; polyarticular dysfunction)

Table 7. Perpetuating factors

- Mechanical/structural/ postural
- Nutritional
- Metabolic/endocrine
- Electrolyte
- Infection
- Neurocirculatory factors
- External compression
- Allergy
- Environmental (equipment/ temperature)
- Sleep deprivation
- Anemia
- Emotional stress
- Other concurrent disease, including fibromyalgia

These terms include overuse syndromes, "cumulative trauma syndromes," and "repetitive strain syndromes." In each of these syndromes, a parameter of use or overuse is a factor. None of these terms, however, are truly sufficient to adequately define the underlying clinical picture presented by many of these patients. Use issues are only one component of a wider picture of dysfunction relative to the ability of tissues to withstand varying usages and loads. Conceptually, it may be more appropriate to consider these as "overload syndromes,"[24] because load implies work capacity and introduces a variety of additional therapeutic variables (**Table 4**). Space does not permit an in-depth discussion of these issues, but the reader can refer to other reviews on this topic.[8–10,15,16,20,25,26]

Summary

Although it is essential for the clinician to adequately examine and treat patients for all signs of dysfunction, this is even more critical in the performing artist. Failed treatment and misdiagnosis can have a devastating impact on the career and artistry of the performer. An in-depth understanding of the nature and causes of myofascial pain and dysfunction is critical—not only in terms of making appropriate diagnosis, but also in restoring performing artists to their craft as quickly as possible. Pain is only an underlying symptom of musculoskeletal dysfunction, and that dysfunction is the result of imbalance between agonistic and antagonistic muscles that resets the joint range of motion and produces abnormal tissue tension. Because the performing artist's career and artistry demands excellence, treatment is often required beyond the point of merely alleviating pain. It must also be directed to restoration of as normal a range of motion and strength as possible. Failure to achieve these goals invariably results in residual dysfunction in the tissues, setting the stage for recurring disability and pain.

Foot and ankle problems in dancers

Lew C. Schon, M.D.

ABSTRACT: *Lower extremity problems, specifically in the feet and ankles, are common in dancers. This is not surprising considering the repetitive and acute stresses applied to lower limbs during this rigorous performing arts activity. When evaluating a dancer with lower extremity complaints, the nature of these demands must be appreciated. In addition to routine physical examination, static and dynamic biomechanical evaluation is paramount to analysis and treatment of leg, foot, and ankle conditions. Although a particular problem, such as painful bunion, may seem localized, it is often related to other factors, such as weak posterior tibial tendon, tight heel cords, or inadequate or forced turnout. It is incumbent on the physician to treat the specific area and, more importantly, to discover contributing factors that may be corrected by changes in technique or training. The physician caring for dancers should communicate with the instructor, physical therapist, or choreographer to facilitate the process. An overview of some common maladies and their characteristic findings are presented.*

Dr. Schon is an orthopaedic surgeon in the Department of Orthopaedics, Foot and Ankle Center, Union Memorial Hospital, Baltimore, Maryland.

Toenail disorders

Toenail disorders, such as onycholysis, onychomycosis, subungual hematoma, ingrown nail, and paronychial infection, are seen frequently in dancers. Onycholysis is destruction and thinning of the nail from repetitive trauma to the nail plate. The nails become thin and flaky, and this can be quite painful. A simple solution is to protect toenails with lamb's wool or cotton and apply several coats of nail polish to strengthen them.

Onychomycosis is a fungal infection that causes a discolored and thickened nail. The condition may or may not be painful. Typically, we do not recommend an oral antimycotic due to its toxicity and the high rate of recurrence following its cessation. Drying agents or topical fungicides may have some success. The best treatment is trimming and occasional debridement of the nail for symptomatic relief. In ballet dancers, we do not recommend nail removal and matrix ablation as this may lead to a tender, exposed nail bed. Other dancers may respond to this treatment, depending on the demands of the toe's dorsum.

Subungual hematoma is bleeding under the nail from acute or repetitive trauma. The toenail appears normal, but there is a black discoloration of all or part of the subungual region. The condition may not be painful, but often an acute subungual hematoma that occurs from a direct injury is quite painful and may require drainage. Asymptomatic and chronic hematomas should be left alone. Melanoma may mimic subungual hematoma in appearance, so suspicious characteristics, such as changes in color, shape, or size, should be noted.

Ingrown nails result from irregularities of the edge of the nail or nail fold impinging the surrounding tissue. This local trauma causes inflammation and possible infection. Acute treatment involves removing the offending portion of the nail and administering antibiotics. Occasionally, the entire nail margin must be removed. For chronic or recurrent infections, the nail is "retrained" to grow beyond the flesh. This is accomplished by placing cotton wisps of collodion or benzoin under the nail's edge to prevent impingement. If this is not successful, removal of the nail and a portion of the matrix (the tissue responsible for nail growth) may be warranted.

Paronychial infection is an infection at the lateral nail fold and eponychium. The area is tender, red, and swollen. If the condition is detected before an abscess develops, oral antibiotics may be successful. If not, drainage of the abscess is necessary.[1]

Corns, callouses, and blisters

Corns and callouses are thickening of the keratin layer of skin from pressure between a bony prominence and external surface. Most often, corns occur over the joints of the toe's dorsum. Callouses are the thickening of skin on the plantar aspect under the metatarsal heads. Soft corns are areas of thickened skin between two toes. In soft corns, the hyperkeratotic skin becomes moist and macerated, sometimes leading to infection. Symptomatic corns and callouses may be padded with lamb's wool, foam, or a felt pad and shoes modified as needed. Sometimes, callouses or corns can be pared for symptomatic relief. Occasionally, an underlying bony prominence must be removed because of recurrent ulceration, infection, or unabating pain.

Blisters are the early response of unprotected skin to the sheer forces generated between the shoe, foot, and ground. Blisters are usually a problem at the beginning of a season. Once the skin thickens, blistering is rarely a problem. Treatment of symptomatic blisters includes wearing a second skin or moleskin. Vaseline (petroleum jelly) can also reduce friction. Usually, only appropriate observation for infection is needed.

Bunions

Bunions are caused by hallux valgus (a deviation of the big toe) with uncovering of the first metatarsal head. The bunion may be further accentuated by a bursa or sac of fluid between the bone and skin. However unsightly, a bunion is not a cause of concern based on specific loss of function or pain.[2] The overall alignment of leg, foot, ankle, and hips must be evaluated. Often, a dancer's overzealous attempt to achieve a nonphysiologic turnout is responsible. The foot may pronate in turnout—a condition known as "rolling in." Development of a bunion is a multifactorial phenomenon, including factors such as ligamentous laxity; genetic predisposition; tight heel cords; hypermobile, first metatarsal, cuneiform joint; inadequate external hip rotation; and pressure during toe shoe work or relevé. Treatment is directed toward underlying factors, relieving symptoms by padding and stretching shoes. Most dancers merely require reassurance and encouragement to continue dancing through some discomfort. Surgery to correct a bunion may end or limit a dancer's career and should only be recommended as a last alternative.[2,3]

Hallux rigidus

Hallux rigidus is a condition in which there is decreased mobility of the first metatarsophalangeal joint with pain usually at the extreme of dorsiflexion. Often, a bony prominence can be palpated on the dorsal aspect of the first metatarsal head or sometimes at the base of the proximal phalanx. When limitation is minimal, conservative modalities are useful. When range of motion is markedly compromised and demi-pointe or relevé becomes unbearable, a resection of the reactive periarticular bone may be warranted.[2,3]

Metatarsal stress fractures

Metatarsal stress fractures are extremely common in dancers and occur at the distal end, middle, or proximal[4,5] area of the metatarsus. The pain is activity-related, improves with rest, and may be associated with increased warmth and swelling of the foot. Relative rest with avoidance of specific offending activities is usually all that is needed if fractures are detected early. In longer-standing cases, greater restrictions may be necessary. A water barre and removable short-leg brace are necessary for resistent metatarsal stress fractures. Cross training prevents deconditioning during recovery.

Plantar fasciitis

Plantar fasciitis causes inferior medial heel pain. It occurs from overpull of the plantar fascia at the medial tubercle, where the fascia connects to the calcaneus. This condition may be associated with rolling in and pronation. It may also be associated with a tight Achilles tendon. The pain is worse in the morning, when rising to stand, and after sitting. The pain improves with rest. Although this condition is also called heel spur syndrome, relationship of the spur to the pain is not well substantiated. Many patients with heel spurs do not have pain, and many patients with pain do not have heel spurs. Approximately 16% of the population will have asymptomatic heel spurs.

Treatment is conservative and includes stretching exercises, walking, anti-inflammatories, heel cups, orthotic devices, and prudent use of injections. For cases in which treatment fails and suffering continues for about one year, surgery may be warranted.[6]

Tendinitis in the foot and ankle

Several tendons may produce symptoms in the dancer, including peroneal tendons, posterior tibial tendons, extensor hallucis longus tendons, and flexor hallucis longus tendons. Dull, aching pain is produced when specific tendons are stressed. Occasionally, a foot deformity may be secondary to diminished activity of the inflamed tendon. For example, an inflamed posterior tibial tendon may cause the foot to become more pronated. Occasionally, the inflammation is initiated by mechanical factors, such as subluxation or partially torn tendons. Hallux saltans, a triggering of the big toe, is caused by a thickened portion of the flexor hallucis longus tendon or muscle that impinges as it attempts to slide through its sheath behind the ankle joint.[3,7] Achilles tendinitis causes posterior ankle pain, which is aggravated with grand plié or plié. Swelling, inflammation, and tenderness occur along the Achilles tendon. Occasionally, a thickened area of tendon is noted.

Most tendinitis cases respond to anti-inflammatory medication, physical therapy, and relative rest. Occasionally, a brace and water barre are required. In recalcitrant cases, release of a stenosing tendon sheath or débridement of tenosynovitis may be indicated.

Impingement of the ankle

A dancer with posterior impingement of the ankle has pain behind the ankle when he or she points the foot or goes up on relevé, demi-pointe, or pointe. They will note difficulty fully pointing the foot. Posterior impingement may occur with a painful os trigonum, unstable ankle ligaments, or anatomic variations of talus shape. Os trigonum is an accessory ossicle off the posterior aspect of the talus. The bone lies lateral to the flexor hallucis longus tendon. The bone may be completely separated from the talus or joined by fibrous tissue or cartilage. Occasionally, a dancer has a large trigonal process connected with the talus, causing impingement.[7]

Patients with ankle instability can also develop an impingement. As the foot goes into demi-pointe, the talus plantarflexes and subluxes anteriorly from the mortise. The calcaneus and talus shift anteriorly and abut posteriorly on the tibia.

Treatment of these conditions is, for the most part, conservative with avoidance of the offending extreme positions. If these measures do not lead to remission, resection of the trigonal process or os trigonum is warranted. In patients with chronic ligamentous laxity, benefits of limiting motion by stabilizing ligaments to prevent impingement must be weighed against restricted motion and potential surgical complications.

Anterior ankle impingement may also occur in dancers. Symptoms are reproduced with plié. The dancer experiences pain in front of the ankle as the ankle dorsiflexes. Also, the heel comes off the ground earlier when performing a grand plié. Anterior impingement may be caused by anterior osteophyte on the talus. Occasionally, it occurs with impingement of the synovium or the anterior edge of the anterior tibiofibular ligament. It is important to distinguish these entities from a tight Achilles tendon. Treatment is symptomatic. In cases that fail to resolve, débridement of the osteophyte or resection of the inferior edge of the anterior tibiofibular ligament may be necessary.[3]

Leg pain

Leg pain in dancers may occur from a myriad of conditions, including stress fractures of the tibia or fibula, compartment syndrome, nerve entrapment (especially of the superficial and common peroneal nerves), pulled muscles, and radiculopathy from a herniated disc.[2] A common distressing problem in dancers is anterior tibial stress fracture. This stress fracture causes pain and swelling in the anterior part of the tibia. The pain is exacerbated by taking off and landing from a jump. Eventually, the pain progresses and becomes constant. If an x-ray shows anterior cortical hypertrophy and transverse lucency, a diagnosis of anterior tibial transverse stress fracture can be made. These fractures usually do not heal rapidly. Occasionally, a stress fracture goes on to catastrophic failure with complete tibial fracture. As this fracture carries a bad prognosis, several authors recommend early treatment with pulsed electromagnetic fields or surgery.[2]

Summary

In addition to common maladies that affect feet in the normal population, dancers are exposed to a higher frequency of overuse injuries. It is critical to recognize characteristic presentations of these problems and institute treatment in accordance with the dancer's desire to continue dancing. It is also essential to address static and dynamic forces contributing to an injury.

Although most consider dance an art, it must also be appreciated as a sport. These patients should be treated with the same intensity as a basketball player or tennis pro. Most importantly, physicians should assume the role of interpreter, communicating the medical perspective of problems to dances, instructors, and therapists. With this team approach, uneventful, speedy recovery is not just a midsummer night's dream.

Applied ergonomics: Adaptive equipment and instrument modification for musicians

Richard N. Norris, M.D.

Dr. Norris is medical director, National Arts Medicine Center, NRH-Outpatient Centers. Bethesda, Maryland.

ABSTRACT: *Failure or difficulty in treating musicians' overuse injuries is often due to overlooking aggravating roles of activities of daily living. Numerous devices are available for people with limited or painful hand function to protect joints and minimize stress of daily activities. The occupational therapist can evaluate the patient and determine which adaptations are appropriate. Instruments may be modified to render them more ergonomic and less likely to cause injuries; this is especially true for wind instruments. Biomechanically and ergonomically correct seating can minimize back and neck strain. Orthotics, such as modified chin and shoulder rests for the violin, may minimize the stress and strain of holding an instrument. Just as there is a drive to make buildings and public transportation barrier-free to the physically disabled, musical instruments can be made barrier-free with adaptations like terminal devices for upper extremity prostheses. Principles of industrial and occupational medicine, especially regarding ergonomics and adaptive equipment, can be applied to the musical patient for treatment and prevention of injuries.*

Assistive devices for activities of daily living

During the acute phase of an overuse injury, daily activities are often significant aggravating factors. Failure or difficulty treating these injuries is often due to overlooking this. Numerous devices are available for people with limited painful hand function to protect joints and minimize stress of daily activities. The occupational therapist can evaluate the patient and determine which adaptations are appropriate.

For example, jar wrenches increase leverage, telephone holders or headsets avoid sustained grasp, key holders improve leverage and avoid pinch grip, and cylindrical foam sleeves are used with writing or eating utensils. These items are relatively inexpensive. Catalogs are provided free of charge by manufacturers.[1,2]

These devices should be used primarily during the acute phase of injury to minimize physical stress on the tissues. The patient should be weaned as soon as possible to prevent tissue fragility secondary to overprotection.[3]

Musical instrument modifications

Body shape. Guitars and, recently, violas have been designed with part of the instrument body recessed to permit easier access to the higher positions for the left hand. Resultant decreases in left wrist flexion help avoid the high pressures associated with carpal tunnel syndrome[4] and minimize friction of the flexor tendons against the transverse carpal ligament.

The bass fiddle should be selected with sloping shoulders if the musician is short in stature or does a lot of playing in the high positions (such as soloists). This minimizes impingement of the left forearm against the sharp edge of the instrument or thrusting the left shoulder forward when reaching down the neck.

To borrow a phrase from computer vocabulary, the flute is not the most user-friendly instrument. The neck is a common area of dysfunction due to the tilted and rotated head position. The length of the flute makes it necessary to rotate the head to the left to relieve strain in the left shoulder. Holding the flute parallel to the ground puts strain on the right shoulder as that muscle is fatigued by sustained contraction. Many players get around this problem by dropping the right elbow toward the body, which relaxes the right shoulder muscles. The downward angulation of the instrument usually results in tilting the head 30 to 40 degrees in addition to the rotation. Many teachers advise students to allow a slight head tilt and slight drop of the right elbow. This is about the best compromise under the circumstances.

Rotating and tilting the head are problematic. Wind instrumentalists would ideally like to play with throat and neck muscles relaxed. Rotating and tilting the head require neck muscle contraction. Maintaining this position several hours a day for years can lead to muscle strength and flexibility imbalance in the neck. This position also causes mechanical narrowing of the cervical foramina.[5] When compounded by spondylosis, it can lead to nerve impingement with symptoms ranging from neck and arm pain to cervical radiculitis. The neck is also vulnerable to muscle spasms of whiplash from automotive injuries, which may cause such discomfort upon rotation and tilting that flute playing becomes impossible.

A new design for the mouthpiece has been developed by forming a 30-degree bend just past the lip plate, allowing the head to remain in a near neutral position and the right shoulder to be relaxed.[6] This is not a new concept. Years ago, industry began making tool handles that were bent at an angle so that workers could avoid working with a bent wrist. The tone of the flute does not seem to be affected, but no formal testing has been done. The downside is a decrease in the stability of the instrument, which can be remediated with orthoses ("StediRests").[7]

Reduction of static loading. Static loading, which occurs when the weight of a tool is sustained and supported by the hand, is an etiologic factor in workers' injuries.[8] Industry addressed this by developing ways to suspend tools to remove the weight from the hand. This approach also works for musical instruments. An end pin on the cello relieves the player from supporting the instrument. End pins are also used for the English horn (bass oboe) and tuba, in which a modified end pin tipped with a ball rests on the chair between the thighs.

More recently, Fry developed a post for the clarinet that relieves common right thumb strain.[9] Freeing the right hand also opens the possibility of alternate fingerings, which may be more efficacious.

The oboe and soprano saxophone, being straight instruments, tend to be held away from the frontal plane of the body. At this angle, a neck strap is relatively ineffective in taking the load of the instrument off the right thumb. A tool, however, has been designed to bend the staple (the hollow metal tube that holds the oboe reed), allowing the instrument to be held more vertically.[10] Similarly, the soprano sax (Yamaha) is now available with an angled neck. The increased verticality allows more weight to be taken off the thumb by the neck strap.

The bassoon is commonly supported by a seat strap—a strip of leather attached to the end of the instrument and on which the player sits. This still leaves quite a bit of weight in the left hand due to the instrument's leftward inclination. This can be reduced or eliminated with a cantilevered end pin from the end of the instrument beneath the player's chair to a point on the floor directly under the instrument's center of gravity.

For the nonclassical guitarist in standing position, it may not be feasible to eliminate static loading. Weight of the guitar often leads to left trapezius problems at the contact point of the guitar strap. The strap should be wide and well-padded with closed cell foam to most effectively distribute the guitar's weight. A new design places the weight on the right shoulder with a waist strap as an option.[11]

Carrying the instrument and accessories can be a significant source of static loading, particularly on shoulder muscles. Adaptive equipment can minimize strain. Many cello cases have built-in wheels, and backpack-style cases are available for a variety of instruments.[12]

Key modification. Woodwind instruments are especially amenable to key modification. Location of flute keys can be customized to fit the player's hand, and the cluster of keys worked by the right little finger can be angled toward the finger,[13] reducing strain. Keys operated by the left fourth and fifth fingers can be lengthened to achieve a more neutral left wrist position.

Clarinet keys should be modified when the player lacks independent sublimis function. This condition, in which there are interconnections between the fourth and fifth flexor digitorum sublimis tendons, restricts certain fingerings on the clarinet. This problem is remediated by modifying the location of keys.[14]

Levers that operate French horn valves can be lengthened to provide greater leverage and widened to provide increased contact area. This is often accomplished by soldering dimes to the ends of the levers.

Seating

Like office workers, musicians often suffer from poorly designed seating. Biomechanically and ergonomically correct seating can minimize back and neck strain. As Dr. A.C. Mandal points out in his book *The Seated Man,*[15] the human body is poorly designed to sit with the hips and knees bent at a 90-degree angle. The chair seems to be derived from the ancient throne—designed for ruling, not working or playing musical instruments.

The International Conference of Symphony and Opera Mu-

sicians conducted a survey in 1986 regarding the incidence of musculoskeletal problems in instrumentalists.[16] The survey revealed the high incidence of lower and upper back pain. Another study reported in the *New York Times*[17] also indicated high incidence of back pain in instrumentalists.

Back pain in the sitting position has several causes: poorly designed chairs, deconditioned backs, inadequate body awareness, and physical/emotional tension. Excellent posture during solo practice may become distorted in the orchestra when musicians share a music stand and crane their neck to see the conductor.

The mechanics of sitting. According to Schoberth, when hips are flexed to 90 degrees, the femur (thigh bone) can only rotate 60 degrees in the hip socket. The remaining 30 degrees come from posterior rotation of the pelvis resulting in loss of the lumbar lordosis.[18] This places the torso's center of gravity approximately three inches behind the ischial tuberosity, creating a posterior torque on the back. This results in a sagittal C-curve to the entire spine. In order to sit erect and resist the torque, the back extensor, abdominal, and hip flexor muscles have to contract. Continual contraction of a muscle reduces its blood flow, resulting in the buildup of metabolites. When metabolites accumulate, they cause pain resulting in muscle spasm, and a vicious cycle ensues.[19] Flattening to the lumbar curve has other painful consequences, such as increased pressure on intervertebral discs[20,21] and stretched capsules of the facet joints.[22]

For wind instrumentalists, a further consideration is diaphragmatic function. The diaphragm arises from the lower aspect of the ribs and sternum and inserts on the upper lumbar vertebrae. Flattening in the lumbar spine results in flattening of the diaphragm, limiting its range of motion and thereby decreasing the airflow.

Use of a forward-sloping seat alleviates many of the problems arising from loss of the lumbar lordosis, such as strain on the back muscles and ligaments and diminished breathing capacity. If the seat slopes forward, the torso is brought directly over the ischial tuberosity, reducing the torque that forces the back into a C-curve and allowing an erect posture with minimal muscular effort.

The forward-sloping principle is seen in historical illustrations of seated workers from Egyptian times to 19th century Europe, but seems to be forgotten by designers of modern chairs until the relatively recent advent of kneeling chairs from Scandinavia. The chief disadvantages of kneeling chairs are discomfort in the knees (flexed to about 13 degrees), lack of easy portability (critical to musicians), and expense (even more critical to musicians).

Musicians who travel are often subjected to sitting on standard folding chairs. A practical solution is a lightweight, portable wedge cushion to temporarily modify the existing chair seat.[23] The back is placed in a position of comfort similar to that of the kneeling chairs, without knee discomfort. A dual-layer foam system provides comfort and firm support.

Even less expensive are alternatives such as a rolled towel at the rear of the seat or a two-by-four inch board under the back legs of the chair. While observing a recent, youth-symphony orchestra rehearsal, I noted that several wind and string players tipped the backward-sloping chairs onto the front legs to attain the forward-slopping effect.

Seat modification is only a battle in the war against back discomfort. A good strength and flexibility exercise program; frequent breaks to change position during practice; attention to body awareness by such means as yoga, and Alexander or Feldenkrais work; and relaxation techniques such as meditation, biofeedback, or stress management programs, can free the musician of the physical discomfort that often takes some joy out of playing.

Orthoses

Orthoses may minimize the stress and strain of holding an instrument and improve body-instrument interface or fit. Two examples will be discussed here. The posts, described earlier, to eliminate static loading are also considered types of orthoses.

The flute. Although left-hand problems outnumber right-hand problems in flutists, quite a few suffer strain and physical tension in the base of the right thumb and muscles pertaining to this area. One could argue that this most likely represents error in technique, with the player using excessive tension in the right hand or improper placement of the right thumb.[24] In this author's opinion, however, certain intrinsic balance problems with the instrument benefit from the enhanced stability attained with the use of orthoses or "rest." This is especially true when one uses the angled head flute.

The right thumb rest. There is great variation in the way the right thumb is positioned on the flute. Most commonly, the thumb is held underneath the flute and serves several functions. The first function of the right thumb is to support part of the flute's weight. The load is greater with the longer B-foot, or with gold or platinum flutes.

The second function of the right thumb is to provide opposition for the fingers as they press down on the keys. The harder the flutist presses, the more force there is transmitted to the base of the thumb.

The third function of the right thumb is to stabilize the flute while playing open-position (no fingers down) notes by squeezing the flute between the little finger and thumb of the right hand. The flute tends to be unstable in open positions because the mechanical rods on which the keys pivot are offset—that is, they fall outside the right thumb's base of support. When the fingers are lifted off the keys, the flute tends to roll in toward the player. This rolling is usually counteracted by slightly increasing the pressure between the flute and chin with the left hand while squeezing the flute between the thumb and little finger of the right hand, creating a source of muscular tension in the right hand.

Another source of discomfort arises from the small area of contact between the edge of the thumb and the rounded flute when the hand is held in the natural position—the ulnar side of the thumb facing the pad of the index finger. The thumb falls in this position when the hand is relaxed. This concentrates the flute's force over a small area of the thumb, which by its bony nature is not very pressure-tolerant. A common solution is to rotate the thumb upward (supinate) so the soft pad contacts the flute. This, however, is an unnatural position requiring mus-

cular force to achieve and maintain. Increased muscular tension in the thumb and hand may cause pain and injury and inhibit maximal dexterity.[25]

A product called "bo-pep thumb guide" corrects some of these mechanical problems, but not all. The bo-pep transforms the base of the flute from a convex surface to concave, conforming to the thumb's shape and increasing distribution of force over a wider surface area of the thumb. Even with the bo-pep, however, the weight of the mechanism rods still falls outside the thumb's base of support and the flute still tends to roll inward with open-fingered positions.

The StediRest uses a nonslip, cork-lined metal clip that grips the flute and has an adjustable, foam-padded metal extension customized to fit the thumb.[26] This serves two main purposes. First, it distributes pressure from the flute over a wider area of the thumb, allowing the thumb to be held comfortably in the natural position. Second, the weight of the rods now falls through the base of support, stabilizing the flute and preventing it from rolling inward.

The left index rest. Typically, the left index finger hyperextends at the knuckle joint, and the flute is supported on the ledge that is formed. In this position, nerve compression in the finger is quite common, resulting in numbness, "pins and needles," or pain. For the majority of flutists who lower the flute's end to relax the right shoulder, the flute must be pressed rather firmly against the lower lip to prevent the instrument from slipping. Interestingly, two common oral problems of flutists are loosening of the lower teeth and temporomandibular joint (TMJ) pain.[27] Both problems are likely related to the amount of pressure against the lower lip and teeth. Again, the bo-pep increases comfort by changing the rounded surface of the flute to better fit the finger, but does little to stabilize the instrument.

The StediRest for the left hand uses a foam-padded hook that curls around the base of the left index finger, yielding comfort and enhanced stability without increased pressure or muscular effort. The flute can be completely supported and stabilized from underneath without using any fingers on top or excessive pressure inward against the jaw. This aids injury prevention and enhances technique as the hands are more relaxed, allowing greater finger dexterity.

The violin. The violin's roots are in Renaissance times, when, as the vielle, it was held vertically in front on the thighs and bowed like a little cello. In modern form, it is held between the left shoulder and mandible with various ways to accomplish this. Distorted and nonphysiological postures are common, such as "hiking" of the left shoulder and leftward tilting and rotating of the head. This posture, and ill-fitting chin and shoulder rests, often lead to a variety of maladies such as trapezius muscle spasm, cervical muscle strain, radiculitis from foraminal impingement, TMJ problems, and acneiform skin lesions where the chin rest contacts the skin ("Fiddlers' neck").[28] Many of these problems can be remedied by adjusting or custom molding the chin and shoulder interfaces.

The principal reason for excessive elevation of the left shoulder and tilting of the head is the fact that the chin and shoulder rests fail to adequately fill the space between the angle of the jaw and the left shoulder. This is similar to holding the telephone receiver while writing. The solution is to raise the chin rest with cork shims or to have the violin shop make a raised one. Raising the shoulder rest would lift the entire fiddle up and force an increase in the abduction of the bowing arm, risking rotator cuff impingement.

Although numerous styles of chin and shoulder rests are on the market, players often complain of being unable to find one that feels just right. This is not surprising given enormous variations in human anatomy. Shoulder and chin rests may be individually fitted by a certified prosthetist and orthotist (CPO), using the same impression and casting techniques for orthotics and prosthetics. Custom molding the shoulder rest enhances the sense of security in holding the instrument by improving the contact area. Less clenching of the instrument is required. Customizing the chin rest can afford a better head position and distribute force equally over the entire contact area, avoiding skin and TMJ disorders.

Adaptive equipment for the physically disabled

Just as there is a drive to make buildings and public transportation barrier-free to the physically disabled, musical instruments can be made barrier-free with certain modifications and adaptations.

French horns, normally played with the left hand, can be built "backward" to accommodate left upper extremity amputees. Prosthetic terminal devices allow holding the trombone and drumsticks, and metal picks affixed to the ends of prostheses allow guitar playing.

For quadriplegics, sip-and-puff controls can be adapted to a computer and used in conjunction with musical software packages for composition and playback.

Summary

Applying principles of industrial and occupational medicine, especially regarding ergonomics and adaptive equipment, benefits the musical patient in treatment and injury prevention.

The treatment of overuse injury syndrome

Hunter J. H. Fry, M.S., F.R.C.S., F.R.A.C.S.

Dr. Fry is a plastic surgeon in Australia and a specialist in music medicine.

ABSTRACT: *The emphasis on performance injury has shifted from epidemiology to prevention. Rest treatment, modified or radical, followed by rehabilitation, remains the cornerstone of treatment. The basic features, details of management, and side effects of these treatment phases are discussed at length, followed by a detailed description of the author's experience with 176 musicians seen for overuse injury syndrome. Forty-one patients were not prescribed rest treatment, refused rest treatment, or quit rest treatment early; 45 patients were prescribed a modified rest treatment program, of whom 87% were cured of symptoms; and 90 patients were prescribed radical rest treatment, with a final success rate of 87% also.*

Overuse injury syndrome or performance injury in musicians is documented in many published studies.[1–8] Emphasis has shifted from epidemiology to prevention. Since overuse prevention lies in control of use, a common sense medical point of view provides most answers to preventing this debilitating condition among instrumental musicians. It is particularly sad to see this condition in children, indicating that even simple messages of prevention may not be being taken seriously.[6–8]

Little has been written recently about treating this disorder, especially the *results* of treatment. By contrast, emphasis in 19th-century literature was on rest from causal and aggravating activities, and recoveries were reported from that management.[9,10] Many writers, such as Waller[11] and Poore,[12] stressed that the earlier this was undertaken the better.

Turning to the late 20th century, however, there are two distinct manifestations of overuse in instrumental musicians—**painless focal dystonia** and **painful musculoligamentous overuse**. Focal dystonia is the painless condition of loss of coordination and the presence of involuntary movements. Treatment results reported for this condition are largely unfavorable,[13,14] although Hallett et al reported some improvement with botulinum toxin.[15] Prolonged rest, biofeedback, psychotherapy, steroid injections, and operations have no significant effect.

Painful musculoligamentous overuse is much more common and is characterized by pain and loss of function in muscle groups and ligaments subjected to excessive or unaccustomed use. It carries a better prognosis

even when technique has been affected. Perhaps the only recent publications dealing with cure of symptoms rather than improvement are those of Fry[16] and Smythies,[17] although overuse syndrome in this latter study was not music-related. Virtually all reports recommend a period of rest.[18] Results, however, are generally expressed in degrees of improvement. If one accepts that improvement or cure of symptoms results from rest as described in modern and 19th-century reports, rest still remains "the cornerstone of treatment."[18]

I am unaware of any reports of worthwhile improvement from anti-inflammatory drugs, acupuncture, surgical operations, physical therapy, or psychotherapy. Predictably, exercising overused painful muscles and ligaments usually worsens symptoms.[19,20]

The purpose of this paper is to define "rest" and to detail treatment of painful musculoligamentous overuse with a program of pain avoidance, which under my direction has produced cure of symptoms and return to pain-free music performance.[16]

Rest treatment: Phase 1

Definition of rest. "Rest," in this context, means resting from all pain-causing or pain-aggravating activities. It is important, however, that muscles, ligaments, and joints function as normally as possible in other respects.

General principle underlying rest treatment. The principle behind rest treatment is to lower the activity level to a degree that structures tolerate, without causing pain or aggravating existing pain.

Contraindications in treatment. Contraindications in rest treatment are as follows: (1) Splintage is strictly forbidden, unless for occasional or temporary means to get better sleep. If splintage is employed, stiffness in joints is certain, muscle wasting may become exaggerated, and the range of motion in joints may not be fully recoverable. (2) Use of any drugs that modify pain may confuse monitoring of the pain level, causing inaccurate assessment of progress.

There are two types of rest treatment: modified and radical.

Modified rest treatment. In less severe examples, pain avoidance may be achieved by modified rest, still allowing some use of the instrument. Treatment continues until the patient becomes pain-free or improvement ceases. This often takes four weeks to four months. Time and intensity of playing must be reduced to the degree that pain is no longer produced. The painful thumb of the clarinetist is relieved of static loading by a clarinet post. Aching shoulders and neck may respond to body control and awareness modes, such as Feldenkrais, Alexander, yoga, or physical therapy, perhaps with a review of the musician's physical activity so certain sporting activities may be deemed appropriate. Sometimes modified rest is tried before resorting to radical rest.

Problems of technique are generally reviewed in detail before referral of a musician to a physician. In the best interdisciplinary management, however, there is discussion between the physician and music adviser. Works requiring great hand stretches, such as Chopin etudes, may not be suitable for some, and revision of repertoire is sometimes all that is necessary. This still falls within the theoretical framework of "rest from pain-causing activities." Trying to play a difficult work up to speed before movements are fluent, particularly for girls between 12 and 16, may cause overuse. This exemplifies the importance of interdisciplinary assessment and management.

Radical rest treatment. Basic features. In more severe examples of painful overuse, pain avoidance cannot be absolute, but the aim is to get as close as possible to that ideal. The musician must cease playing, and use of the affected hands has to be modified radically. This continues until the patient is pain-free or ceases to improve. This usually takes 6 to 12 months.

It is the musician's choice to accept or reject treatment. The rest program is prolonged, but in the 19th and 20th centuries it is the only treatment that has brought success to musicians, as judged by published articles. It is tiresome and tedious for all. Any alternative would certainly be preferable—if only the disorder could be cured by surgical operation, drugs, acupuncture, or psychotherapy. Many patients with overuse syndrome have tried some or all of these treatments without success.

During rest treatment, severe problems of lifestyle and interpersonal relationships must be accommodated. Although hands must be kept moving as normally as possible, tasks such as cleaning teeth, tying shoelaces, doing buttons, opening faucets, or using eating utensils may cause pain. Success often depends on an innovative streak to find ways around difficulties, as well as organizing help from others.

The patient must be seen every week to monitor progress and give psychological support. Progress is measured by the intensity and duration of pain noted on the "best day" of the preceding week. As time goes on, there is more pain-free time on the best day and intensity falls. A patient usually compares intensity of pain on the best day of the current week with that of the week before. Most patients, even though they have been forewarned, become upset about "bad days," particularly when they follow a good day. Fluctuations are normal during recovery.

It is mandatory to explain to the patient before going on the rest program that in the first three weeks, pain increases, becomes sharper in quality, and comes from new areas nearby. Even when patients are warned, they may become alarmed. Constant reassurance is necessary. This warning can be totally forgotten, and reminders may be required. It is important to explain to the musician why splintage and particular drugs are contraindicated. It might at first seem heartless to forbid analgesics when pain is present. The minor to modest degree of pain relief, however, must be set against scrambling the monitoring process. It is vital that pain level and the pattern of fluctuation are reported as accurately as possible to the physician.

All of this time the musician is not playing the instrument, and the feeling of loss is very real. The sense of dependency on others may be irksome. The only thing that sustains patients is the progress being made. This is the best psychotherapy. Putting a patient in contact with another patient in a more advanced stage of recovery is often helpful, as is the opportunity to speak to a musician who is pain-free and doing hand rehabilitation exercises (see below). Getting the patient to a successful end point is the first of two very difficult stages in treatment.

Details of management. All day-to-day activities have to be planned. Taps are turned on and off with elbows using special fittings or a long-handled lever. Doors are opened and closed with the foot. Food is cut by others and eaten with one plastic implement. An electric toothbrush must be used and held with both hands. A hairstyle to make hair grooming easy is adopted. A blow-dryer can be mounted in a stand rather than handheld. Clothes should not have to be pulled on and off forcefully; slip-on shoes and track suits are suitable. To turn the key in a lock, the key should be gently put in the lock and then turned around with a long piece of wood with a slit in the end; this slips over the key for leverage. These are a few examples of the adaptations needed to avoid pain.

A single episode of noncompliance may wipe out weeks of progress. There is little margin for error. Even allowing for fluctuation, unexpected episodes of pain must be traced to the physical activities that caused them. A learning curve should be as steep as possible in this regard.

Commitment to radical rest treatment. It is most necessary to explain to the musician the full extent of inconvenience brought about by rest treatment. Some musicians are not prepared to commit to this program and will reject this treatment when it is suggested to them. They often say they are prepared to play in pain and will takes measures to control it, such as avoiding other pain-causing activities and taking analgesics before performance or practice. Some may not have the emotional or physical resources to endure the long period of time on the rest program. If they are freelancers not covered by insurance, they believe they cannot stop. Recent evidence indicates that playing with pain may be associated with risk, as there appears to be a connection between length of symptoms and loss of coordination leading to impairment of technique.[21] This must be made known to the patient.

Some patients who commit themselves to treatment find it is too difficult to continue. They take themselves off the program and fail by default. With close monitoring, noncompliance usually shows up quickly. These patients often freely admit they were unable to comply with the demands. This is mostly due to difficulties in organizing activities, lack of help, feelings of depression, and loss of drive.

Musicians who stay with the program show a remarkably high success rate—in excess of 80% even in severe and advanced examples. As pain fades, they must not start doing more with their hands, as this will risk a setback. It is rewarding to see patients brought to a pain-free state, and it is a tragedy to see others who do not have the physical or mental resources to stay with the program. Prior to treatment, it is useful to have a video record of the "five finger" test for loss of coordination.[22] A standard test on a keyboard and computer records loss of control more scientifically.

Side effects. Psychological strain from the program can only be justified, accommodated, and balanced by obvious progress. The physician has to be infinitely patient. In recovery, musicians often have odd sensations in the arms, flickering muscles, circulatory changes, or strange feelings on the skin, which may be alarming. These sensations occur in most patients and are quite benign.

Many musicians express concern that their muscles will wither. As long as normal movements are maintained, diminution in muscle bulk is usually not great. Once patients become pain-free, or nearly pain-free, they often gain a perception of greater muscle strength, although they never put this to the test. During rehabilitation, muscles certainly become stronger and more effective. Late follow-up indicates no lasting problems in this regard.

Joint stiffness is an occasional problem. Two of about 280 of my patients suffered bilateral frozen shoulders. Both recovered completely. Stiffness in the wrist and finger joints may occur if the disorder is accompanied by a reflex sympathetic dystrophy, which can be quite severe. In these uncommon examples, the joints may not recover all movement, but they generally do. Such patients take longer to get to a pain-free state and have more setbacks in rehabilitation. Skin may become glossy, particularly on the back of the hands, and lose texture. I treated three such patients, one moderately severe. Many patients show minor autonomic disturbances.

When the patient is totally pain-free for three weeks, the rehabilitation phase begins.

Rehabilitation: Phase 2

Basic features. Getting to a pain-free state is tedious and difficult for patient and physician. Getting the musician back to performing pain-free with sustainable practice habits is more difficult still.

It is a mistake to think the battle is won when the patient becomes pain-free; nothing could be further from the truth. Setbacks are the rule rather than the exception, creating frustration for patient and physician. Management of the rehabilitation phase is time-consuming, requiring weekly monitoring.

Muscles, ligaments, and joints have been lightly loaded for some months. Strength and endurance should not be relied on. Early exercises must be within almost ridiculous safety bounds and advance at an equally safe rate. A common mistake is advancing too quickly or beginning rehabilitation before all pain is gone. In either instance, failure is almost certain.

Details of management. The newly pain-free patient begins with a five-finger exercise on the desktop, starting with five seconds each hand twice a day. If there is no adverse reaction, five seconds is added to each exercise so that after about two weeks, the exercise will be just over one minute. There must be retreat at any sign of pain or major discomfort, resuming for a shorter time and working up again. Another segment is then added in the middle of the day, adding five seconds each day until it catches up with the other segments. Then all segments are advanced at the same rate to about five minutes per day.

At this stage, the hands are transferred to a piano, keyboard, or terminal. Over the course of two weeks, a five-finger exercise on the piano is gradually substituted minute by minute for the desktop. Exercises must be completed by the clock, and any sign of pain or major discomfort brings about immediate cessation of exercises. When pain stops, exercises are resumed

for a lesser time and gradually increased daily as before. During this time, in all other respects, the patient must behave as if still on the program, avoiding all other activities that might cause pain. This rate of advance is about average.

When the patient reaches five minutes three times a day of five-finger exercise, a fourth segment is added. When this catches up, the exercise is gradually increased to 10 minutes four times a day, at which times a fifth segment is added until this one catches up. If the patient has not had a setback for a time, he or she graduates to a C major scale in addition to the five-finger exercises. At this stage, a 10 second per day increase may be possible if there are no recent setbacks and all is going well. The next step is usually other scales and diminished-seventh arpeggios. When there is 15-minute activity five times a day and no recent setbacks, triad arpeggios are added with other scales and some sight reading. No matter what the patient's instrument, I have found rehabilitation on the piano the best way for gradual resumption of use of the hands. Only when the patient is managing some arpeggios, can there be some relaxation of day-to-day hand use. At this time, it is useful to try the five-finger test or the computer-generated test to assess recovery of coordination.

Setbacks are usual, and from time to time one must cease exercises until major discomfort or pain disappears. This requires patience. During the early stages of playing scales and arpeggios, it usually becomes obvious, particularly with pianists, that loss of coordination has largely or completely disappeared. Some pianists note months later that they not only regain previous technique but may have an extra measure of control.

When reaching 15-minute activity five times a day on the piano or other keyboard, violinists, clarinetists, and others can start on their own instruments again, sometimes earlier. It is essential for oboists and clarinetists to never again take the instrument's weight on the thumb, or recurrence of the disorder is virtually guaranteed.[23,24] Each instrument has its own problems in the rehabilitation phase. I revised my earlier opinion that left-handed lesions in guitarists have considerably worse prognosis than others. Since I wrote my treatment paper, four successive guitarists became pain-free on rest treatment, resuming performance at music school.

Rehabilitation may take up to six months, but many individuals are functional in half this time; it cannot be rushed. Sports medicine practitioners knew a long time ago that muscle groups can only increase performance 5% to 10% a week.[25–27] Webber wrote, "With respect to running sports, the '10% per week' rule for increasing training intensity and duration is now widely accepted amongst amateur runners, and it must particularly be followed in training the young runner."[25] O'Neill and Micheli, commenting on overuse injuries in young athletes, advise gradual and cautious acquisition of muscle group performance.[26] Kiefhaber and Stern also recommend the 10% rule.[27] After months of low activity of musicians' overused muscle groups, this should be an absolute outside limit. Probably an arbitrary figure of 5% gain is safer.

It is important to ensure there is a steady, slow grading of difficulty and that practice segments for at least six months do not exceed 20 minutes with at least that much rest between segments. Even in the long term, practice segments should never be longer than one half hour, and difficult and easy segments should be alternated. As the musician gradually does more with the instrument, it is possible to do more everyday tasks requiring use of the hands. These, however, should be increased with caution and sensitivity.

Decisions and alternatives. Because the two stages of rest treatment may take up to 18 months, is this really practical or worthwhile? It is for some because the success rate is high. Many orchestra musicians have had overuse symptoms for up to 30 years.[26] Eighteen months compared with a lifetime of playing does not seem too awesome when placed against these figures. Sometimes it takes less than a year. The alternative may include a progressive increase in symptoms with some degree of muscle failure and a gradual impairment of technique. Rest treatment might be looked at as the "best of a bad lot" of alternatives.

Other viewpoints on treatment urge continuation of playing. Some pedagogues hold that this is entirely a matter of technique, and the appropriate treatment is to keep on playing but to convert to the "right way." This viewpoint fails to explain occurrence of the syndrome across the ability spectrum from music school students to some of the most famous players of the century with state-of-the-art techniques. Another viewpoint is that pain is necessary to play properly. Two pernicious adages are modified to be more medically correct

- No pain, no gain = no brain. (Courtesy of Dr. Thomas Mastroianni)
- Practice 'til it hurts, so I can beat your grades.

Results of rest treatment: Personal series

Explanation of table. The **Table** summarizes my amended results from modified and radical rest (pain avoidance) programs as detailed in the *Journal of the Royal Society of Medicine* in 1988.[16] The results are amended because outcomes can now be reported on those whose treatment was in progress at the time. When they were initially reported, the percentage of success could not be definitely stated because of patients "in the pipeline." The number in this series was actually 176, as a fifth viola player was accidentally left out of the total. In the original publication, I attempted to provide individual detail about patients, although two untreated miscellaneous patients were not described. The article gave all the basic information, but avoided analysis that categorized the 22 pipeline patients as failures because they were not yet cured of symptoms, excluded them altogether, or made some estimate of outcome. Because their outcomes are now known, an appropriate final analysis is possible. Though the **Table** appears to be somewhat complex, a few words of explanation will simplify this.

Columns 1 and 2 show instrument distributions in these musicians. Column 3 indicates the distribution of the 41 patients who did not have rest treatment. This is made up of two subgroups. The first group (30 patients) did not start the rest treatment, gave up the instrument, or transferred to another instrument. The second group (11 patients) quit early, although they initially accepted advice to go on the rest program.

These musicians decided within a few weeks, at most, that they were unable to meet the demands of the pain avoidance program or decided to keep playing and tolerate the pain. In any event, these musicians were well short of an end point when quitting the program.

Column 4 shows the distribution and fate of 45 patients treated with the modified rest program; 39 became pain-free and resumed performance—an 87% success rate.

Column 7 shows the 22 pipeline patients described in the initial series. Those who eventually became pain-free and returned to performance are identified by an asterisk. The final success rate is 87%—exactly the results in the less severely affected patients.

Columns 5, 6, and 7 show retrospective results of the 90 patients on the radical rest program before the end results were known . Column 5 shows the success rate counting the pipeline patients as failures. Using this rather harsh criterion, the success rate is 69%. Column 6 excludes the pipeline patients from analysis, making the success rate 91%.

Recurrence, reinjury, and career progression. Follow-up time in this series varies from 5.5 to 9 years. In general, there was only one major music-related reinjury and six minor re-injuries, which were not music-related. These episodes were due to trauma to the upper limb, where some pain was present that was aggravated by playing the instrument. The patients were treated with rest from the instrument and all other pain-aggravating activities until the pain went away. This took two to five weeks. Another nine patients reduced musical performance. These episodes were unrelated to recurrence of symptoms, but were associated with changes of lifestyle such as marriage, childbearing, leaving school, or intercurrent illnesses. A few patients indicated that they could almost instinctively feel their threshold of re-injury. Although they played pain-free at previous standards, at times they felt within a half a dozen notes of the disorder coming back. Two musicians returned to the orchestra only a short time before retiring, but remained pain-free.

The major re-injury occurred in a principal clarinet player who was pain-free and performing in top form for five years after being cured of symptoms. After a vacation, instead of easing in, she rehearsed and practiced the first clarinet part of Strauss' *Electra* for excessively long periods without breaks. She noticed a falloff in extension of the right ring finger. She continued intensive playing and practicing, and the problem worsened. I advised urgent rest from the instrument, to no avail. The five-finger coordination test demonstrated her loss of control mainly in the ring finger. She is now under care of a practitioner who apparently told her the problem is due to her arms being too long for her body, suggesting she play without her clarinet post and load the clarinet fully on the right thumb. She has resumed a lesser position in the orchestra. Her ring finger problem remains and appears to be stabilized. She still manages to play a standard repertoire.

Two teenage trumpet players who recovered after loss of embouchure kept playing, but remained cautious about their

Table. Results from modified and radical rest programs as reported in 1988

					Patients accepting rest treatment as prescribed			
1	2	3			4	5	6	7

	176	41	30	11	39/45 =87%	62/90 =69%	62/68 =91%	*Patients (16) now playing pain-free **Final success rate is 78/90 = 87%**

routines. Two clarinet players and one trombonist who lost embouchure did not recover and did not play again.

Of the patients having rest treatment who were classified as improved rather than cured of symptoms, all stated they derived some benefit in terms of pain level and ability to keep playing.

Discussion. These results accord well with 19th-century reports, showing the musician with painful musculoligamentous overuse committed to this difficult regime has an 80% plus possibility of cure of symptoms and return to pain-free music performance with sustainable practice habits. Practice habits have to be modified considerably, spread over the day in 20- to 30-minute segments—no more. Practice has to be planned and calculated.

Despite published detail in the 1988 treatment paper, outcome of those on rest treatment was misinterpreted by Bengston and Schutt,[29] who believed all patients in the series had rest treatment.[30] This led to their fallacious calculation of a 55% cure of symptoms. Accuracy of reported results must be beyond doubt as this has implications for decisions about treatment. Many musicians would likely put up with this disruptive program for an 87% probability of cure. They are much less likely to do so for a 50/50 chance.

The recurrence or re-injury rate from musical activity is very low. This can be attributed to training in the rest and rehabilitation phases, when patients were sensitized to pain-free physical capacities. Apparent awareness of a pain threshold is revealing.

Many patients seen outside this series improved with a limited period of rest, but were not pain-free. Recurrence was the rule rather than the exception when performance was resumed—particularly in orchestra players. I have seen situations in which patients became pain-free from rest but without a controlled rehabilitation phase. Here, the recurrence rate also tends to be high as muscles and ligaments cannot increase performance in terms of strength and endurance in such a fashion. Loss of embouchure in clarinetists, trombonists, and French horn players appears to have poor prognosis.

Conclusion

Rest treatment—applied judiciously—gives musicians an excellent chance of cure of overuse symptoms and restoration of pain-free playing. Is it worth the sustained effort over months, with little margin for error? Is it better to put up with the pain and retain a normal lifestyle? What about longevity of the playing career? Is the trade-off between short-term sacrifice and long-term survival worthwhile? Will insurance finance such prolonged treatment?

Affected musicians must answer these questions for their own situations after balancing pros and cons. The decision is not always easy.

Addressing stress-related illness in professional musicians

David Sternbach, A.C.S.W.

Mr. Sternbach is a licensed, certified social worker and a psychotherapist in private practice in Silver Spring, Maryland.

Abstract: *The health profession has become increasingly aware of the frequent incidence of work-related injuries and illnesses occurring among professional musicians. Although all workers run risks of stress-related health problems, performers must work under especially stressful conditions. Musicians must perform before the public; they must perform under the constant critical scrutiny of conductors; and they are expected to perform perfectly. Stressors, some unique to the music profession, some shared with other working populations, can come from the environment in which musicians must work, from psychological pressures, and from factors intrinsic to a performing career. In response to the increasing incidence and awareness of the health problems of professional musicians, music medicine, a new medical specialty, has come into being. Physicians who treat performers can act as resources to educate their patients about work-related stress and to refer them to appropriate mental health professionals. They can be instrumental in helping musician patients return to performing careers with a new ability to handle work-related injuries and stress.*

The new medical specialty—music medicine—has emerged in response to the growing awareness among health professionals of the alarming increase in the amount and severity of professional musicians' work-related injuries and illness. Symphony and opera musicians have a high incidence of occupationally caused pain, exceeding even most factory workers.

In a 1985 survey of major orchestras, 76% of those responding reported enough pain to seriously affect their performance.[1] One study reported that professional musicians die 20%–22% sooner than their counterparts in the general population, and that coronary heart disease accounts for almost 5% more deaths among musicians than in the general population.[2] Studies of popular musicians are lacking, but in all likelihood they may run even higher risks with their more uncertain economics and frequent touring that create whole new sets of stressors.

Those embarking on careers as performing musicians are sustained not only by their ambitions and talent, but also by their hopes and expectations for rich and fulfilling creative lives. Only gradually do many come to realize that achievement of their artistic and professional goals may cost

them their physical and psychological health. Substantial evidence shows that this is true for growing numbers of performers. Work-related injuries, illness, and psychological problems have reached epidemic levels among musicians.

Sources of musician stress

Since everyone who works must cope with both the stress of everyday life and stress in the workplace, what makes musicians a population at special risk for stress-related illness and injuries? Three factors present in the lives of musicians produce a total stress quotient far higher than might result from any one factor taken alone. Together, with the other common, everyday stressors, they create a situation with potential for overwhelming stress unique to the music profession.

First, musicians perform before the public, facing all the terrors associated with stage fright. Second, they work under the constant scrutiny of conductors both in rehearsal and in concerts, making them subject to criticism at all times, even during public performances. Third, musicians are expected to deliver perfection—note-perfect performances every time, everywhere, and under all circumstances. By contrast, professional athletes playing before the public enjoy a more generous tolerance for error. A major league ballplayer with a .300 batting average may be a star; however, no audience would tolerate a musician who missed 7 out of every 10 notes. Probably no other profession involves the combination of these particular stress factors.

Other challenges face particular groups of performers. Jazz musicians, improvising four to six hours every night, must be endlessly creative. Club date musicians, especially single-engagement players, go to jobs rarely knowing with whom they will be working or even what they may be asked to play. Even minor slips may cause them never to work again for that hiring agent. Older players notice uneasily the changing musical styles with which they are not familiar, and they feel less able to compete with younger players. Studio recording musicians are expected to get it right on the first take; studio time costs money.

The elements of stress for professional musicians lend themselves to classification into three categories: environmental hazards, psychological pressures, and intrinsic factors. These categories extend beyond the sources of stress common to us all in everyday life because music, an overcrowded profession, can be viciously competitive and highly insecure.

Environmental hazards include all workplace issues that negatively influence a musician's productivity and well-being. Psychological pressures refer to both intrapersonal and interpersonal issues. Intrapersonal issues deal with one's ability to regulate, question, or react to self-directed messages, internalized values and attitudes, and how one mediates critical messages and maintains confidence and self-esteem; interpersonal issues involve transactions with conductors, managers, and the public. Finally, intrinsic factors are stressors unique to a performer's life and inherent in a performing career.

Environmental hazards

Any systematic survey of musicians' working conditions reveals an extraordinary number of stressors. Psychologist Robert Holt documented nearly 60 types of workplace hazards and stressors and more than 55 types of dysfunctional stress reactions using data drawn from a bibliography of nearly 200 studies on workplace stress.[3] Musicians routinely suffer exposure to virtually all the hazards enumerated by Holt. Four notorious stress contributors that affect musicians include shift work, changes in workplace locations, changes in supervision, and economic insecurity.

Working hours for professional musicians bear no resemblance to the nine-to-five regularity and predictability that many workers in other fields enjoy. Rehearsals and concerts take place mornings, afternoons, and evenings. Schedules change from week to week. Tour schedules are grueling and disruptive, especially for those attempting to maintain a family life.

Frequent changes and poor conditions in a musician's work setting also provide a source of stress. Freelance musicians may rehearse, play, and record in three or four different locations in a single day. This typifies their work, week in and week out, throughout their careers.

Musicians must constantly adjust to changes in leadership. Symphony musicians face new conductors every week during the orchestra season; opera house orchestra players have new conductors every evening. Each conductor presents a different personality and musical style, and makes different demands. Freelance classical, popular, and commercial musicians rarely know who will direct them from one day to the next.

Financial insecurity, a fact of life for most musicians, imposes tremendous stress and emotional costs. In this respect, the music profession has changed very little for many musicians, even for great masters, over the course of history. Mozart struggled for financial survival in Vienna amidst all sorts of intrigues by other composers. J.S. Bach, in addition to his duties as organist, composer, and choir director at St. Thomas Church in Leipzig, taught Latin classes to justify to the church fathers the modest salary he received. For every famous musician who struggles with poverty, surely hundreds of the less famous have also struggled to survive economically.

Physical risks. Beyond these four major stressors, the daily lives of working musicians include many others. Performing is hard physical work, especially for brass players. Davis, telemetering electrocardiograms of musicians in performance, has documented arrhythmias and tachycardias in brass players and Valsalva-like responses, and has observed conductors maintain an average increase in heart rate of 89% during performances.[4]

Inadequate rehearsal breaks predispose players to overuse and repetitive-motion injuries, especially for players of stringed instruments. A marked increase in musculoskeletal injuries, including carpal tunnel syndrome and focal dystonia, has resulted.

Concert halls may be overheated, chilly, or drafty, affecting muscles and destabilizing the tuning of instruments. Chairs may be poorly designed. Lights may shine too brightly in television productions or be too dim in theater pits. Backstage areas are often unsightly, cramped, and unsafe.

The stage itself may pose hazards. On a 1990 Pittsburgh Symphony tour of the Far East, a cellist, walking onstage,

stepped on a black cloth spread across an unrepaired gaping hole. He fell 18 feet to the cellar floor below. He escaped with minor injuries, but the fall totally ruined his valuable Italian instrument. Such an event traumatizes the entire orchestra, whose members must collect themselves and present a concert to an expectant audience. The old adage, "the show must go on," exacts high costs in terms of stress.

Musicians, like athletes, are constantly vulnerable to physical injuries. Athletes, especially football players, refer to "the moment"—an injury that can occur at any time and bench a player for weeks, for a season, or for life. This is no less true for musicians. With a sprained finger, a bruised lip, or a sore throat, most working people (including well-compensated athletes) can do a day's work; a violinist, a trumpet player, or a soprano cannot. By the nature of their work, musicians cannot do anything other than the single jobs for which they trained. Any number of physical or psychological problems can derail careers. For example, the career of Leon Fleischer, a concert pianist of international reputation, came to an end when medical techniques of the time could not alleviate muscle cramps in his right hand.

Musicians risk hearing loss and tinnitus. Performers in front of the brass and percussion sections run the greatest risk. A member of the Chicago Symphony told of experiencing temporary deafness in one ear after sitting directly in front of the bass trombonist for a long Berlioz work. The Chicago Symphony management considers this hazard serious enough to supply acoustic ear plugs to any orchestra members who request them. Many orchestras have experimented with chair designs incorporating acoustical protection. Overexposure to high volume amplification systems have made many rock musicians either partially or totally hearing disabled. Peter Townsend, a member of the rock group The Who, has for many years limited his onstage appearances to 10-minute intervals, a result of hearing injuries.

Poor labor–management relations. Employment conditions for most musicians were uniformly deplorable well into the 1970s. Problem areas included abusive management styles, arbitrary audition procedures, hiring attitudes that excluded minorities and women, non-existent job protection policies, and poor and inconsistent salaries and benefits. Improvements in these conditions for American musicians lagged far behind more enlightened European practices (a disparity this author addressed in articles contrasting American and European orchestra management policies).[5,6]

Labor–management negotiations over the years have resulted in substantial improvements for musicians in many larger orchestras. Yet many smaller, regional orchestras still offer partial, substandard wages with minimal benefits. Financial conditions for those in the popular music field, where synthesizers may replace entire bands and recordings may replace live performances, remain precarious and insecure. Moreover, symphony musicians who had won many gains have seen these erode in recent years.

Musical institutions, in common with many businesses and industries, have no immunity to the costs of the recent recession. Managements turn to the musicians to compensate for declining revenues; they declare bankruptcy, often in mid-season, or continue seasons by extracting large concessions from musicians as the price of remaining even marginally employed.

While contract agreements and enforcement of labor regulations can improve many environmental issues, others are simply facts of performers' lives to which they must make a satisfactory adaptation if they intend to continue in their profession.

Psychological pressures

Psychological pressures involve the maintenance of ego in response to nonphysical stress factors. Professional musicians must deal with psychological stress as they adapt to the intrapersonal (internal) and interpersonal (external) conflicts inherent to their profession.

Intrapersonal sources of stress. Intrapersonal conflicts, the musician's ability to cope with the anxiety of performing and with self-criticism, pose a major source of psychological stress. Stage fright, a fact of life for nearly all performers, is toxic in ways that can affect life off-stage as well as on. Anticipatory anxiety, the dread of future calamity or failure, can make a musician's life in the hours, days, or even weeks and months before a critical performance an unremitting purgatory and contaminate life for those around the performer as well.

On-stage anxiety varies from mild excitement, which can serve to enhance performance, to full-blown panic attacks with a host of physical symptoms including palpitations, dizziness, transient limb paralysis, uncontrollable shaking in the hands and legs, sudden memory loss, black-outs, cardiac arrhythmias, and even cardiac arrest.

Post-performance anxiety takes the form of remorse over real or imagined errors. Mental review, a sort of backstairs repartee, can range from an even-tempered appraisal of one's performance to judgmental processes generating symptoms resembling post-traumatic stress disorder, especially after auditions or competitions in which career aspirations are at stake.

Performance anxiety is not confined to actual concerts. Professional musicians must also endure over-supervision, a known stressor.[7] Their work in rehearsals and concerts takes place under the constant observation of conductors. Studies reveal increased stress for workers from excessive and intrusive over-managing styles.[8] Most office workers or, for that matter, physicians in their consulting rooms, would find it disagreeable to carry out their work with a supervisor overseeing every action, ready to question or overrule every decision.

The famous French horn player, Philip Farkas, once remarked that he preferred playing a concert to rehearsing under the tyrannical direction of Fritz Reiner, long-time musical director of the Chicago Symphony. "It was almost a relief to play the concert," Farkas said. "At least then Reiner couldn't stop and criticize you. And he never criticized in a kindly way."[9]

Performances before the public allow no second chances. When the trumpet player misses a note, everybody notices, and it stays missed. Recordings have conditioned audiences to expect note-perfect performances. As a result, critical standards for live performances have become unreasonable and exces-

sive. Musicians are painfully aware of these unrealistic standards used to measured their performances.

They also know that careers can suffer setbacks and even total destruction with a single negative review—a worry by no means limited to solo performers. Some years ago, a critic harshly reviewed the second horn player of the Metropolitan Opera Orchestra for an unacceptable level of missed notes and entrances. On the strength of the review, the musician was dismissed. He in turn sued the critic and won the case when cross-examination revealed that the critic could not distinguish one horn part from another. The musician, however, never recovered his position nor his career. The entire affair had a chilling effect on the other orchestra members, doing little to ease their performing anxiety.

Interpersonal sources of stress. Interpersonal factors include orchestra players' expressed frustration over lack of artistic control; conductors generally reserve to themselves decisions about interpretation, tempo, and style. The entire issue of managerial style has a more severe impact on musicians than on workers in other fields because of the nature of musicians' work. Unless players choose to perform in a disinterested, dissociative manner, emotional sensitivity must play a large part in a performance. This very sensitivity—the seeking for an intimate rapport with fellow players and with the inner spirit of the music—renders musicians more vulnerable. Disrespectful, thoughtless, or offensive verbal styles, often the everyday currency of many conductors, can do much damage at such moments.

While the public has little knowledge of conductors' abuse of orchestra members, musicians cite this problem as one of the most stressful factors in their working conditions, generating anxiety and hostility, and provoking many fine players to leave the profession. The conductor Kurt Sanderling once told of hearing a famous music director at a major opera house say of his musicians, "They are dogs. They have to do what I tell them." Sanderling, himself a model of respectful behavior toward orchestras, commented succinctly on this style: "Disgraceful!"[10]

Musicians who remain in the profession find ways to come to terms with these psychological pressures, and most develop mature adaptive coping mechanisms. These skills, aside from their technical and artistic capacities, enable them to sustain remarkably high levels of anxiety and perform consistently at levels sufficient to maintain careers. Many others, unfortunately, do so through maladaptive strategies. These musicians find themselves at high risk for psychological problems, alcoholism, and abuse of street and prescription drugs. They routinely ingest beta blockers as though they were after-dinner mints, frequently without any type of medical supervision.

Intrinsic factors

Some aspects inherent in careers of professional musicians create a third source for stress. These include conflict with the cycle of psychological development through which all people must travel, accepting the limitations of one's instrument and within one's self, the drive for excellence, the effort to ward off becoming stale, and inevitable loneliness.

Life-cycle conflicts. Psychological development unfolds in stages as we move through life, a process Erik Erikson referred to as "the life cycle."[11] Each level poses new challenges that require ever more complex reorganizations and integrations of the psyche. Professional musicians must work through not one, but two life cycles, the second one involving their artistic growth throughout their career. Like the life cycle common to all people, this second life cycle also contains within itself developmental stages. Often the two cycles conflict with one another.

For example, adolescence is a critical time for the developing personality. In these transformation years from youth to adulthood, dating, consolidation of sexual identity, and fine-tuning of social skills in small and large group activities enhance social confidence. Young musicians, however, may have commitments of three, four, or even six hours of daily practice, leaving them little time to develop their social skills. They may miss opportunities to broaden their horizons by nurturing other interests on which they can later rely to help them balance the demands of their music career.

Musicians lunge toward the top of their careers in their late twenties and thirties. But the pull of careers collide with the urge to begin a family, especially for women conscious of the ticking of their biological clock. The well-known cost to women who drop out of the business world is even greater for performers. They must find the time and energy, not only for the many re-entry tasks required in any career, but also to restore their athletic fitness and playing skills.

Perhaps the most poignant example of life-cycle conflict occurs later in the aging process. As performers continue to grow and mature as artists, it becomes evident that physical capacities diminish with the passage of years. Older musicians perceive the strength and vigor of their youth slipping away, even as they judge themselves and are judged by others against the very standard of strength and projection they helped to establish when younger. More noticeable in the winds than strings, and still more so for brass players, all players must eventually deal with this issue. Finally, if they have totally bound up their identity with music, parting from a performing career can seem like the end of life rather than the time for new beginnings and new choices. This can cause more stress, loss of connection to life, withdrawal, and depression.

Living with imperfection. Every instrument, including voice, has its special beauties and limitations. Musicians in a sense marry their instruments and must learn how to adapt to the frustrations and tolerate the limitations imposed by the choice they have made. Some deal successfully with this issue; some never resolve their ambivalent feelings.

Striving to realize one's own image of excellence, to exceed one's past accomplishments, and to reach new heights create a sense of living a rich and meaningful life. A price, however, accompanies such striving; constantly pushing oneself to the edge of comfort and beyond generates great frustration and anxiety. To sustain this tension requires a psychological makeup equal to the challenges imposed by setting artistic ideals or even simple, raw ambition.

The finest artists commit themselves to such tension. Isak Dinesen's opera singer in *Babette's Feast* says, "It is terrible

and unbearable for an artist to be encouraged to do, to be applauded for doing, his second best. Through all the world there goes one long cry from the heart of artists; give me leave to do my utmost."[12]

Only rarely do professional musicians believe they have realized the totality of their artistic vision on stage. The maturity to acknowledge and accept the gap between artistic vision and the realization of that vision in actual performance takes time to develop and sustain, posing yet another challenge in the musician's life process.

Fritz Kreisler said that in his youth he had a certain ideal of violin playing, and by age 25 he had achieved that goal only to realize that a new, more complex ideal had emerged. In his thirties, when he thought he had achieved that goal, a new goal again emerged. And so it went throughout his career. At his retirement, he said that he thought the gap between performance and ideal had become smaller, but it remained. To best tolerate this life-long process, one needs a strongly grounded ego and a well-rounded, balanced personality to find satisfaction in areas other than as a performer.[13]

In their study years and throughout a career, artists must walk a fine line, employing a positive obsessive style, without which excellence is unlikely, while steering clear of a negative obsessive style, which can disable any sustained creative effort by excessive self-criticism and fault-finding. This balancing act can rob musicians of any joy in making music and set the stage for cynicism or depression.

Inspiration and isolation. Musicians require fresh inspiration in their lives to revitalize their commitment, their energy levels, and their creativity. While most people have this need in common, staleness in performers becomes quickly evident, and the consequences of their loss of momentum can readily affect their careers. The trumpeter Harry Glantz once said, "If I don't practice one day, I notice it. Two days and my colleagues notice it. After three days, everyone knows it."[14]

Finally, musicians must live with loneliness. They spend countless hours in technical preparation, studying throughout their creative lives to maintain technical skills, learn style and interpretation, and master new repertoire. Performers learn to live with the many hours spent in isolation, but this can result in a sense of alienation and loss of identification with society.

At the time that young performers choose music as a career, they rarely recognize these elements connected with that choice for their fullest implications. To maintain excellence as a performer will always require enormous physical and mental discipline while so many stressors and uncertainties challenge commitment and create self-doubt about one's chosen career.

Freud said that our most significant life decisions are made from deep within the unconscious and are only partially subject to mediation by the conscious mind.[15] Few young musicians are equipped to see or acknowledge the many intrinsic stressors associated with the business of having a performing career.

Treatment

Musicians have historically disguised injuries and illness. They will play hurt, play through their pain, both physical and emotional, and continue to do so for years. Until the advent of the new specialty, music medicine, they had nowhere to turn for accurate assessment, diagnosis, and treatment of their problems, especially stage fright. But the traditional reason for disguising health problems remains an issue today.

If a player were too candid about a physical condition or about anxiety, might not this information reach the ears of management and the conductor? And then what consequences might ensue for the musician? This is a serious issue for performers who are not in employment covered by contract protection, which describes virtually all free-lance musicians.

Yet another issue tends to perpetuate disguising health problems. In common with our culture's attitudes toward mental health issues, an onus still attaches in many players' minds to acknowledging stage fright. This stands in the way of performers locating appropriate treatment, and secretiveness and nondisclosure aggravate anxiety. This is particularly regrettable since we know from many sources, Yalum for example, that in groups, individuals can find consensus and validation of their personal issues that can neutralize negative, self-accusing, and self-isolated feelings.[16]

Even more regrettable is the consequence of nondisclosure, denial, and lack of information. Many musicians do not know that most types of performance anxiety can be successfully treated with a combination of chiefly cognitive and hypnotic approaches. Training in relaxation techniques, stress reduction techniques, and cognitive restructuring, education about the nature of stress, and systematic desensitization and imagery rehearsal, are only a few among many effective modalities that prove helpful to many performers.[7,17–19]

Long-term analytically oriented psychotherapy does not serve these patients unless the need to deal with deeply embedded issues around early experiences exists. Even in such cases, patients can receive short-term remediation of stage-fright symptoms while dealing with long-term issues. The author has found brief treatment using hypnosis and imagery rehearsal highly effective in reducing stage fright problems to manageable levels, noting that the stronger the performer, the more likely that brief therapy will succeed.

Physicians' role in music medicine. Physicians can respond to the musician patient population through education. They can, in the role of advocates, recommend stress management programs as part of a rehabilitation schedule, directing patients to resources that can enhance their awareness of stress issues and the importance of bringing their lives into better balance.

In diagnosis, physicians should consider referral to mental health professionals to enrich the assessment and diagnostic process of the ill or injured musician since stress is most likely an exacerbating factor. Their findings and recommendations can benefit the patient when integrated into the over-all treatment plan.

Psychological assessment has a clear role in music medicine clinics and inpatient treatment settings. Psychological assessment can measure the severity of patients' stress as a contributing factor in the presenting problems, and patients' potential

for compliance with a treatment regimen. Short-term individual or group therapy can help patients adjust to the limitations of illness or injury during recovery and reduce the risk of relapse through premature return to playing, or a return to work with the same dysfunctional psychological habits that may produce new complaints.

Even during the primary interview and assessment, physicians can explore with musicians the stressors in their lives and how to deal with them. Of course, this takes time in a busy physician's schedule. One physician wrote, "At the end of the day, having seen 30 or more patients, with 10 more waiting, do I take 40 minutes to talk with a patient about her anxieties and stress or do I take 40 seconds to write a prescription for Valium (diazepam)?"[20]

Physicians can work with rehabilitation trainers and psychotherapists to design, with their patients, a rational program of stepped return to work. Treatment of physically injured patients keeps them as active as possible and advocates work hardening methods. The same approach applies to players with anxiety issues.

Conclusion

The practitioner who treats performers reaps a professional benefit. The many workplace stressors assailing more and more Americans have long been the everyday currency of the professional performing musician. Musicians, therefore, provide a metaphor for most working people, a warning sign of what affects all of us.

As in music, job security in business is becoming a myth. As more people work at home, the issue of isolation that affects musicians in their long hours of practice now affects other workers as well. Burnout symptoms in many occupations indicate that most people can benefit from developing sources for the re-invigoration and the inspiration that musicians must have.

What practitioners learn in treating performers contributes to general practice. Awareness of the role that stress plays in the lives of musicians in directly causing or exacerbating physical illness or injuries can extend to all patients and help to promote the delivery of more complete care. A factory or office worker, business person, or professional, may be viewed not just as a patient with illnesses or injuries, but also as a patient suffering from performance pressures and stress. Caregivers who treat these psychological symptoms in addition to the physical complaints stand a far better chance of bringing about a healing for the whole person.

The sole difference between musicians as a patient population and the general public lies in the greater number of work-related pressures and greater career consequences for performers with medical problems. Such patients can confront a physician with confusing, intense, and seemingly inappropriate demands. The automobile accident victim in the emergency room who insisted that the physician attend to his bleeding lip rather than the compound fracture of the right tibia seemed disoriented and confused. When the patient mentioned that he was the principal French horn player for the Philadelphia Orchestra, the patient appeared more rational and understandably concerned with the embouchure that was the source of his livelihood and that sustained his career and status as an artist.

The artist-performer, as a unique and sensitive patient, requires equally unique and sensitive approaches. A heightened awareness of the psychological concerns of performing artists will promote more successful treatment. Musicians who present in the physician's office with a sprained thumb, soreness in the carpal tunnel area, or anxiety are neither hypochondriacs nor hysterics, but simply ordinary human beings experiencing extraordinary stress. They not only suffer from injuries, but also face a perceived threat to the very core of their emotional lives, their social roles, and their identities.

Life in the orchestra

David Fetter, B.M./Ed., M.A.

ABSTRACT: *The concert soloist and conductor are prominent figures within the orchestra. Their roles make extraordinary demands on them—demands that must often be fulfilled while dealing with the problems of travel. Maintaining one's skill is a constant concern. The orchestra musician is also constantly on guard to maintain performance excellence. Unusual work patterns, obsession with the job, and job stress can put pressure on home life. The strong emotional personality of the orchestra musician must adapt to the conductor's desires and musical tradition. The player must coordinate performance with other group members. Other factors contribute to an environment with rigid boundaries and to the isolation of orchestra members as a group. With the development of performing arts medicine, injuries are less stigmatized and better treated, and performance stress is better managed. A patient's view of medicine is offered here.*

Mr. Fetter is associate dean for Performance Activities and Placement at the Peabody Institute, Baltimore, Maryland.

This paper is based on my years as a trombonist in a number of symphony orchestras—a career that closed with 16 years in the Baltimore Symphony Orchestra—and a more recent perspective gained as an administrator at the Peabody Institute. Of primary interest here is the orchestra musician, but first a brief discussion of two people closely involved with the orchestra: the soloist and the conductor.

The soloist

The concert soloist's life is one of constant travel. One must maintain an extraordinarily high standard of musical excellence, technical skill, and physical and mental stamina, while dealing with the vagaries of modern air travel and a nomadic existence.

For a guest appearance with an orchestra, the soloist remains in one location for nearly a week, for a solo recital, a few days. There is much personal contact with local managers, who arrange press meetings, rehearsals, concerts, and other essentials, and with the soloist's manager, who is probably based in New York City and who works on future concert and travel bookings. The soloist on tour must reserve time for personal practice. There may be time for contact with friends, if one has any in a strange place. There may be periods of isolation between concerts or while traveling. The

soloist must always be on guard to avoid injury or impairment that might affect, even marginally, the quality of performance. For example, going out in the cold for a newspaper could be dangerous, especially for a singer. It is not much of an exaggeration to say the soloist is married to the art.

For the aspiring soloist, stiff competition for concert bookings and at performance competitions demands a certain level of commitment, stamina, and skill. Other traits needed, but not necessarily assured by the selection process, are ease with people, including audience members and donors; joy in performing before thousands of people (some artists, elevated by great talent, are nonetheless reluctant participants); a good business sense with a flair for self-promotion; the judgment to avoid burnout from trying to do too much too soon; and a strong personality adaptable to an unusually stringent, but rewarding lifestyle. Fortunately, experienced soloists often mentor promising performers. A good personal agent or manager will also provide good counsel.

The conductor

The conductor must maintain a similar level of musical excellence to that of the soloist. At the same time, the orchestra's resident music director must act as corporate manager, judge of talent, and musical-political leader. He or she is the target of inquiry and advice from many quarters—the board of directors, management, donors, soloists, agents, orchestra players, composers, audience members, the public, and the press. He or she must also administer, with the help of management, a complex organization, maintaining its artistic image and mission through the selection of soloists, orchestra musicians (a choice in which the musicians usually have a voice), and repertoire. The conductor must also find substantial time for isolated study to weigh artistic decisions that often affect the organization for years and to study scores for upcoming rehearsals and concerts. With so many responsibilities, the conductor will best be a person who thrives on attention and pressure.

Many conductors hold permanent positions with one to three orchestras. This locates them in particular cities for a given number of weeks per year. Many other weeks are typically left free for guest conducting appearances, where travel demands are similar to those faced by the soloist. The traveling soloist and conductor can reduce preparation time by repeating a limited selection of works in a succession of cities.

The orchestra musician

Weekly routine. Actual playing time per week of most leading US orchestras is around 20 hours—the norm for what orchestra players can tolerate while still maintaining a high performance standard. Moreover, the musician usually practices individually and often must maintain an exercise program. Some teach, but many hours of this can sap the energy needed for performance. Players teach as repayment for having good teachers, to preserve traditions of performance or pedagogy, to develop a reputation as a teacher, or to earn money. Some contribute volunteer hours to the orchestra or other organizations. Some are active in related fields, such as musical instrument building.

Musicians in top orchestras enjoy an extraordinarily high number of vacation weeks per year, often around six. This helps relieve stress, but usually only once a year enough weeks are found together to spend time away from the instrument. Weeks off are usually designated by management rather than chosen by the player.

In the orchestra musician's daily routine, proper rest is essential, especially for the older person. Before an evening concert, any activity that would take the edge off performance skill must be avoided. It may be necessary to forgo certain foods, alcohol, and caffeine. There is constant watch on preserving the ability to perform. Normally, a general personal routine is developed and obsessively maintained, including specific mental and physical preparation in the hours before a performance. Upset of the routine can cause stress.

Home life. Because an orchestra usually remains in its home city, the orchestra musician can enjoy a more stable home life than the soloist and conductor. Orchestra touring presents challenges similar to those of the touring soloist and conductor. Wherever the performance, the musician is subject to the same persistently high standard.

Because musicians generally perform evenings and weekends, work patterns conflict with household members with more traditional work schedules. Typically, the orchestra holds daytime rehearsals early in the week and evening concerts later in the week. At worst, concerts are on three or four consecutive nights and Sunday afternoon, blocking out most normal family time. The musician's only day off may be Monday. Some families adjust better than others. The spouse who works normal hours may be distressed by repeated evenings with no companionship. The musician's 24-hour health watch may also cause irritation.

Rotation. Large orchestras normally have sufficient staff to allow members some rotated concert time off. Some orchestras guarantee a few personal leave days per year. Wind sections often carry an extra player to allow rotated time off, since solo wind players cannot afford to show the effect of fatigue.

Effect on spouse. The orchestra musician's spouse can experience fatigue from living with the orchestra member's typically intense fixation on the job. Often the spouse is also a musician with similar career intentions, but the spouse may find it impossible to engage in musical pursuits of equal status or adequate interest, causing tension. The orchestra member may add emotional pressure by bringing home stress from rehearsals and concerts. Over time, the orchestra member's spouse finds ways to cope, or there may be a breakup. Orchestras would do well to pay attention to the effect of this sort of conflict on player stability.

Sometimes both members of a couple are in the same orchestra; sometimes they play the same instrument. There are advantages here, but there are also disadvantages for those who cannot adjust well to living with a fellow expert of strong character and usually strong opinions.

Standard of perfection. Musicians face a perpetual standard of perfection. Of course, perfection is impossible, but this drives a highly motivated person to try harder. The perfectionist gives irrational emphasis to mistakes, leading to a loss of self-esteem. Highly successful people sometimes remember only what went wrong. The self-examination that helps a musician excel can thus become destructive. Each rehearsal or performance brings a new test. Touring and recording increases pressure. The better the orchestra, the greater the challenge. Every day the musician faces the toughest audience—the 95 or so fellow perfectionists in the orchestra who are always assumed to be listening with the greatest scrutiny.

The group member. The soloist and conductor enjoy a certain latitude of self-expression in planning and performance, but the orchestra musician seldom has influence on the choice of music or how it is interpreted. Much of this is determined by the conductor and traditions of the art. While playing, the orchestra musician must adjust every second to the performance of the member's own section and to that of the whole orchestra, while following the guiding motions of the conductor. Orchestra seating, which can rotate in some string sections, and concert dress are also determined for the player.

Added to this regimentation are repeated performances of "favorite" classics and pops concerts, which tend to dull the sensitivity and deplete the stamina needed for classical performance. If a particular favorite challenges physical limitations, its repetition can increase anxiety and perhaps create or exacerbate physical problems. To prepare for touring or recording, works may be repeated several times.

Individual character. The typical orchestra member displays a staunch personality, strong emotion, high intelligence, and great self-motivation. These traits are necessary to sustain many years of study and to persist in the highly competitive orchestra audition market. Often, the strong personality is muted in the everyday persona. Many orchestra members have plans to be soloists or conductors, fueling intense evaluation of the soloists and conductors for whom they play.

The talented personalities who produce the enormous emotional power of the symphony orchestra normally engage in a constant obbligato of observation, second guessing, and debate about what goes on around them. Usually, little notice of this is taken by others. This increases isolation of a group already distanced from its audience. It is a great cultural waste that so much intellectual and emotional energy typically produces nothing but occasional eruptions of frustration that occur at the end of the three- or four-year cycle of symphony contract negotiations.

Some musicians fit the stereotype of the selfish, irrational, emotional artist who never grew up, but most have strong feelings combined with a deep intellectual commitment to the art. This and strong character make them tough at the bargaining table.

More contact with audience members might provide some relief from the isolation of the orchestra. This could deflect some of the perfectionist's self-criticism, since music lovers are typically very positive and appreciative. Conductors and soloists often have this sort of audience communication as they are usually well-known and since there is a tradition of meeting audience members after a concert.

The above comments are not to say that symphony musicians do not enjoy music. While some are disgruntled, the healthy remain passionate about the art. This is often the key to satisfying audiences.

Performing arts medicine

Until the last few years, performance-affecting ailments of musicians were usually closely held secrets. There was fear of job loss should any weakness become apparent. Problems that could be dealt with quietly went unmentioned. A problem could be exacerbated by measures taken to conceal it. Once in a while, an illness or injury became so severe that there was a public breakdown followed by a musician's sudden departure to an unknown future.

With the advent of performing arts medicine, musicians slowly began to talk to each other about injuries related to performance. Stigma attached to injury was reduced. An understanding of problems and genuine interest in recovery grew among musicians and management. In earlier years, a career might have ended, but some orchestras now have disability plans to supplement salary lost during recuperation. While performance-related injury may be covered by workers' compensation insurance, this option is seldom, if ever, pursued. Artists are a challenge to medicine, since they usually require 100% recovery to regain performance-level skill.

A better understanding has come of performance anxiety. There is also greater awareness of the importance of a compatible work environment, including comfortable seating and protection from excessive noise. Chairs and cushions have been designed to aid posture, and ear plugs and sound baffles have been developed to allow a musician to hear with the refinement necessary for coordination with colleagues in the ensemble.

During the infancy of performing arts medicine, most major orchestras were increasing seasons to year-round employment. Longer seasons may have increased the number of injuries, although the percentage of orchestral musicians affected by any injury, from the slightest to most severe, has been consistently around two-thirds in orchestras surveyed, including a study of the Baltimore Symphony Orchestra in which this writer took part.

The next step—prevention of performance-related injury—is coming slowly. Students and professional musicians lead intense, busy lives. Players may resist taking time for a general physical warm-up before a practice session or performance, especially if it seems this may detract from the primary business of music making.

Dealing with stress. The best remedy for performance anxiety is frequent experience performing in front of an audience. An inexperienced or distressed performer should start with small groups of people, usually family and friends, and work up to larger gatherings. It is important to perform for friendly music lovers, who can be inspiring. It helps if the orchestral musician participates in a solo or chamber music recital, or enjoys some different sort of performance.

Musicians employ a variety of techniques to alleviate stress.

Some are used by the general population, such as exercise. The programs of Alexander and Feldendkrais aid posture and breathing, areas of special interest to wind players and singers. Imaging is used to visualize what it will be like to perform on stage. Some add the power of positive thinking, a challenge for the perfectionist made pessimistic by experience. Some "focus on the music," directing thought only to the desired musical result of a performance. Some musicians calm themselves through biofeedback or meditation. Psychotherapy is sometimes necessary. Orchestra managements would be wise to refer players to professionals familiar with artists' problems.

Some musicians rely on beta blockers, which, in this writer's view, are a crutch to be avoided. Because musicians are obsessed with perfection, one can become dependent on anything seen as a potential aid. Adding drug use to a stressful situation is dangerous. It is said that beta blockers are not physically addictive, but they may have an addictive affect on an intense personality made somewhat irrational by stress.

In the injured musician, there is danger that relief of symptoms with drugs will aggravate an injury should the player interpret the pain relief as true healing. In this context, normally beneficial drugs may allow damaging activity.

The patient's view of medicine.

At a conference on arts medicine at the Medical and Chirurgical Faculty of Maryland in January 1992, John DeHoff, M.D. asked a panel of musicians, including this writer, for their views on medicine. This writer has had his share of minor performance-related medical problems. Advice and treatment from physicians has enhanced his performance and teaching. The following axioms were developed from a different perspective—that of one under treatment for nonperformance-related illnesses:

- Avoid telephone medicine because the treatment indicated will depend on your view of the illness.
- Say "yes" if a health professional asks you, "Is this an emergency?" What if you say "no" and you turn out to be wrong?
- If you get sick on a weekend, someone will be on call, but you may not be able to avoid telephone medicine. You may have to make a judgment about the seriousness of your illness: Should you wait until Monday or go immediately to the emergency room?
- Your doctor may not be aware of peripheral, everyday, nonmedical information that can ease your recovery. Ask how you can contact others who have had your illness.
- Campaign for prevention. There is bias against disease or injury prevention built into many health care plans in that they do not pay for a simple checkup. ■

Consultation, a weekly radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on WBAL to discuss the lastest developments in medicine and to answer questions about health issues. Med Chi currently airs the following program of Consultation weekly:

Sunday Morning Consultation
A half-hour program
Interview format: one-on-one talk with John Stupak
Pretaped Wednesday evenings from 7:30 - 8:00 p.m.
with play back on WBAL-AM radio
Sunday mornings at 9:30 a.m.

To speak out, fill in the form below.

Speak Out on Consultation

Consent to treatment: Application to performing arts medicine

Emidio A. Bianco, M.D., J.D.

Dr. Bianco is an internist and legal medicine specialist, Consultation Case Review Branch, Army Health Professional Support Agency, Walter Reed Army Medical Center, Washington, DC.

ABSTRACT: *Because treatment outcomes may have an effect on performing artists' livelihood, physicians should involve these patients in the treatment planning phase by obtaining informed consent. Treatment without consent is a battery. Physicians have several available lines of defense against an allegation of failure to obtain informed consent, including reasonable documentation of treatment plan discussions with patients; the "so what!" defense, which states that the patient would have agreed to treatment despite the risks; and the "unduly alarming" defense, which contends that based on past experience with a particular patient, proper disclosure would cause undue emotional distress. Alert compliance with the laws governing consent for treatment and sound medical judgment are every physicians' legal, ethical, and moral duty.*

All physicians have the duty to obtain consent prior to treatment from every patient or from the patient's legal guardian. Physicians have a professional obligation to be aware of the laws governing consent and informed consent. Physicians who treat professional performers have a special obligation to disclose those adverse effects that are inherent in a particular treatment modality or procedure, particularly where the adverse effect may affect patients' professional survival not just their physical survival.

A physician who fails to obtain a patient's consent to treatment, who gives medical treatment involving an unpermitted contact, commits a battery. American courts vigorously guard a person's right to self-determination with respect to his or her physical integrity,[1,2] and in a battery action, personal indignity has considerable weight. Thus a physician would be liable not only for contacts that cause physical harm, but also for those relatively trivial ones that are merely offensive and insulting,[3] such as spitting on another's personage. A battery action does not require expert medical testimony because the issue is not one of medical science, but whether the physical contact in a given case was unpermitted. A plaintiff may recover damages (money) for unpermitted contact in the absence of physical injury.[1]

Physicians and lawyers familiar with medicolegal issues know that a successful action against a physician based solely on the issue of battery is extraordinarily rare, probably because where expressed (vocal or writ-

ten) consent is not apparent, implied consent will almost always be found. Implied consent is apparent under many circumstances; for example, by some manifestation (head nod), through an overt sign (rolling up one's sleeve for an injection), or when the patient fails to object while being touched. One who consents suffers no wrong. Medical situations in which implied consent is readily apparent include treatment of minor children who require emergency care, comatose patients who require immediate treatment, mentally incompetent patients who need treatment to prevent serious consequences, intoxicated patients who temporarily lack the capacity to reason, and patients who do not sign a consent form (or who may not have given verbal consent) but who allow treatment to proceed without objection.

When a patient consents to treatment, the scope of the consent is limited to the parameters expressed prior to treatment. Permission to operate on the right ear is not permission to operate on the left ear; incidental appendectomy without prior permission during a panhysterectomy could be a battery. On the other hand, if during the course of an operation, a physician discovers disease not anticipated before surgery, he or she would be justified in extending the operation without expressed consent in order to remove or palliate morbid disease.[4]

Consent to treat minors

The general rule of law requires a physician to obtain parental consent prior to administering medical treatment to a minor (less than 18 years of age in Maryland). Most jurisdictions have enacted statutory exceptions to the general requirement for obtaining parental consent. Maryland law presents a typical list of exceptions including the following:

- if the minor is married,
- if the minor is unmarried but a parent,
- in statutory therapeutic exceptions (chemical abuse, venereal disease, contraception, physical examination for rape, pregnancy, abortion, and psychotherapy),
- in emergency care, or
- if the minor is emancipated.

Most physicians know that when death appears imminent without emergency treatment, consent will be implied. On the other hand, what reasonable steps can a physician undertake when the medical circumstances are not yet a true emergency, but reasonable medical judgment requires that the physician should anticipate the need to intervene at some point in order to prevent an impending medical disaster or permanent injury?

Case 1. A 16-year-old professional ballet dancer comes to the emergency department for evaluation and treatment of a displaced, compound, comminuted fracture of the femur. The emergency department physician quickly straightens the lower extremity to reduce the potential permanent neurovascular damage, and summons an orthopaedist. The patient's parents are not present.

The physician follows these steps: first, comfort the patient; second, use all reasonable means, including administrative assistance, to locate the parents; and third, make a reasonable medical judgment, in the best interest of the patient, concerning how long an orthopaedist should wait for parental consent. Assuming that a reasonably safe period is 20–30 minutes before encountering a high risk of bone infection and/or neurovascular damage, after 30 minutes the orthopaedist explains the necessity of the surgery to the ballet dancer, then proceeds. Two hours later the parents, who were nowhere to be found before the surgery, appear in the emergency department and confront the orthopaedist about operating without their consent.

The orthopaedist has two medicolegal defenses: first, despite a reasonable effort to contact the parents, they were unavailable; thus, from a legal point of view the parents had constructively abandoned their child; second, the circumstances placed the physician in the position of having to act *in locus parentis* (as one of the parents on-the-spot)—that is, acting as a prudent parent who would have consented to surgery after receiving reasonable disclosure about the adverse effects of an untreated compound fracture of the femur.

Case 2. Another case involves a 14-year-old boy, an extraordinarily talented violinist, who 10 minutes before arriving in the emergency department had dislocated the fifth finger of his left hand. Upon examination, the emergency department physician notes a dislocation of the distal phalanx, and within a matter of seconds the physician reduces the dislocation. X-ray examination reveals no fracture. The parents object to the emergency department physician's treatment of their child without an orthopaedic consultant.

The emergency department physician has two medicolegal defenses: first, an orthopaedist was not immediately available; second, immediate action was justified based on the knowledge that the longer a dislocation remains unreduced, the more likely permanent injury could occur in the form of fibrosis or neurovascular damage, which would be of special concern to a highly talented violin player.

Consent by spouse

American law does not generally recognize the authority of one spouse to consent to treatment for the otherwise competent spouse. Most physicians, at some time or another, have been intimidated by a patient's aggressive spouse. Some physicians and spouses mistakenly believe that, because marriage inherently endows one spouse with the right to co-consent for the other spouse, or even a right to veto the other spouse's given consent, marriage therefore compromises a patient's right to consent. In Maryland, the court of appeals settled the issue in 1889:

> Surely the law does not authorize the husband to say to his wife, "You shall die of the cancer; you cannot be cured, and surgical operation affording only temporary relief will result in useless expense." The husband has no power to withhold from his wife the medical assistance that her case might require.[5]

In 1974, the Oklahoma Supreme Court reviewed a case in which J.C. Murray, husband of Artie V. Murray, sued Dr. D.C. Vandevander alleging that Dr. Vandevander performed a panhysterectomy on his wife without his consent. The suit did not

allege that the doctor was negligent. The Oklahoma court cited the Maryland case and ruled that a married woman in full possession of her faculties has an inherent right, without consent of her husband, to submit to a surgical operation upon herself. The husband has no inherent right to consent for his wife, nor does he have a right of refusal that can override his wife's consent to treatment.[5,6] In 1976, the US Supreme Court[7] reviewed the constitutionality of a Missouri statute on abortion and ruled that during the first 12 weeks of gestation, the requirement for a co-consent by the spouse or a parental consent for a minor was unconstitutional on the basis that a state cannot grant to a person veto power the state itself does not possess. For reasons similar to those cited in the three cases just discussed, American law does not recognize a family member's right to consent for another family member unless the family member is a legal guardian appointed by a court of proper jurisdiction, or is the natural guardian of a minor child.[8] There is a trend for state legislatures to modify the common law on family consent, particularly where the issue of consent involves an incompetent patient.

Informed consent

Whereas traditional consent emanates from the law of battery, informed consent emanates from the law of negligence. In order to prevail against a physician for legal negligence, the plaintiff must prove four elements:

1. the applicable standard of care in the given case;
2. the physician breached the applicable standard;
3. the plaintiff sustained an injury; and
4. the injury was proximately caused (logically related) by the breach of the standard of care.

In order to hold a physician liable for a lack of informed consent (failure to disclose enough information in order for the patient to make an informed intelligent choice), the patient must prove that the physician breached his or her duty to disclose enough information and that the *breach* of that duty *caused* the injury. In other words, where there is no injury, an action for a lack of informed consent will not stand. This information leads to the reasonable conclusion that a plaintiff in an action alleging a lack of informed consent could prevail even though the traditional consent was obtained, and even though the physician's performance fell within acceptable standards of medical practice.

Physicians should realize that the legal doctrine of informed consent has very strong moral and ethical overtones. The American Medical Association's first, second, and fifth principles of medical ethics[9] state that a physician shall make relevant information available to patients; the American College of Physicians emphasizes that a patient should be informed and educated about his/her condition, should understand and approve of treatment, and should participate responsibly in his/her own care.[10]

Accepting the fact that American courts have defined a legal duty requiring physicians to disclose relevant information to a patient prior to diagnosis and treatment, how much information does the law expect a physician to disclose in order to fulfill the duty to inform? What are the elements of informed consent? Based on a number of appellate decisions and Maryland law on informed consent,[11–13] practicing physicians should note the following elements of informed consent:

- The physician should explain to the patient the nature of the procedure, treatment, or disease.
- The physician should inform the patient about the expectations of the recommended treatment and the likelihood of success.
- The physician should tell the patient about reasonable, available alternatives and what the probable outcome would be in the absence of any treatment.
- The physician should inform the patient about the particular *known inherent risks* that are *material* to an informed decision about whether to accept or reject medical recommendations.[14]

The first and second elements are rarely pivotal issues in an informed consent allegation. The third element is generally not a pivotal issue except when a reasonable alternative might have proven safer or when the outcome of no treatment does not significantly differ from the outcome of treatment.

The fourth element requires basic understanding of the legal distinction between an inherent risk and a material risk. An *inherent risk is a medical concept*—one of a number of known adverse effects that may occur even when the drug is properly administered and indicated, or even when a diagnostic procedure or surgical operation is properly performed. A *material risk is a legal concept*—a particular inherent risk that a physician knows or ought to know would be significant to a reasonable person in the patient's position in deciding whether to reject or accept treatment.[13] The physician must measure the scope of the disclosure by the patient's need to know whether a potential peril is material in making an intelligent informed choice. A physician may delegate authority to obtain informed consent to another physician (house staff) but cannot delegate his or her responsibility.

Apparently, appellate courts believe that physicians are in the best position to decide what information should be disclosed. When physicians inform patients about the medical risks of a procedure or treatment, they hope that the disclosure will suffice to overcome an action for a lack of informed consent. On the other hand, appellate courts have furnished physicians with formidable defenses against an action for a lack of informed consent.

Determining the scope of disclosure

State courts vary on whether the general or professional standard of disclosure should apply in an action for a lack of informed consent. The general standard allows the jury to determine whether the physician disclosed enough information for a reasonable patient to make an informed treatment choice; whereas, the professional standard permits other physicians to testify about whether the defendant physician disclosed sufficient information. The legal sufficiency of disclosure is based on community standards of medical practice. The modern trend is for courts to adopt the general standard. Maryland adheres to the general standard.

Determining the standard of causation

In the legal arena, a patient would not only have to show that the scope of disclosure was inadequate, but must also show that the lack of disclosure (insuffient information to make an informed decision) was the proximate cause of the injury (e.g., hearing loss secondary to treatment). In other words, if a patient had been sufficiently informed, that patient would not have accepted treatment and hearing loss could have been avoided. Depending on the jurisdiction involved, courts have taken at least two different approaches in determining whether a lack of informed consent caused an injury. In the first approach, the *subjective standard of causation,* the jury decides whether the patient would have refused treatment if the physician had imparted the allegedly sufficient information. In the second approach, the *objective standard of causation,* the jury decides whether a reasonably prudent patient (not the patient making the claim) in the patient's position would have refused treatment under the same or similar circumstances. Maryland adheres to the objective standard.

The treatment of hyperthyroidism provides a good example. Three modes of treatment remain in vogue: drug therapy, radioactive iodine, and subtotal thyroidectomy (especially for tumors and obstructive symptoms). The material risks of drug therapy are recurrence of hypothyroidism (72%) and agranulocytosis (less than 1%). The once-feared adverse effect of developing thyroid tumors in later years has not proved more likely to develop in patients treated with radioactive iodine than in patients from a randomly selected population; however, the incidence of a post-radioiodine type of hypothyroidism at 10 years ranges from 40%–70%.[15] Laryngeal nerve injuries that cause hoarseness are well-known risks of thyroidectomy. Vocal cord injury, an inherent material risk of subtotal thyroidectomy, should be disclosed not only to persons such as Placido Domingo and Luciano Pavarotti, but to anyone, because the loss of voice is a devastating injury.

Case 3. A 55-year-old symphonic percussionist develops an *E. coli* peritonitis secondary to a knife wound, which had been repaired several days earlier. He complains of fever and chills. The organism is sensitive to gentamicin, which is administered intravenously in proper dosage for 2 weeks. Gentamicin peak and trough serum levels are within acceptable limits. Shortly after being discharged from the hospital, the percussionist notes that he is not hearing as well as he did prior to his illness. He learns from talking to a friend in his musical circle that gentamicin is a known cause of hearing loss. Audiometric testing reveals that his hearing loss occurs primarily in the frequencies above 4,000 hertz; the audiologist does not consider this loss debilitating. Pretreatment audiometry had not been performed.

Increasing evidence shows that symphonic musicians develop high frequency hearing loss from acoustic trauma, an occupational hazard. Because the patient did not have a pretreatment audiogram, the issue of gentamicin ototoxicity becomes murky and usually favors the injured party. The percussionist claims that if he had known about the ototoxic potential of gentamicin, he would have opted for an alternate therapy. Some physicians favor avoiding aminoglycosides when other regimens equally effective against *E. coli* peritonitis exist.

Physicians, aware that musicians are inherently at risk for high frequency loss from occupational acoustic trauma, should refer these patients for audiometric testing, where practical, prior to the use of a potentially ototoxic drug. The best medical therapy should not be compromised solely on the basis of potential drug toxicity; nevertheless, when equally effective nonototoxic drugs are available, physicians should prefer these. Above all, physicians should inform patients and give them the opportunity to make informed choices.

Defenses for a lack of informed consent action

The collective experience of the medical profession indicates that many patients forget or do not understand what physicians say during an informed consent session. Good documentation provides a defense against an action for lack of informed consent, and unquestionably enhances physician credibility. The informed consent note need not contain great detail, but it should make a convincing statement that the patient received enough information to make an informed choice. For example, a physician treating John Sharpe (a lyric tenor) recorded in a consent note a discussion with him of the possible adverse effects of subtotal thyroidectomy, including loss of his voice and/or the loss of his parathyroid glands, which would require life-long therapy in order to maintain normal serum calcium levels.

A second defense involves the lack of immediate capacity of a patient to consent; for example, patients in coma, patients with transitory intoxication, mental retardation, or psychosis, or patients who as minors may be mentally competent but lack legal capacity to consent. One would not expect informed consent to be an issue during a medical emergency.

The third defense involves a "so what!" defense. The physician proffers that even if the patient had been informed of the risk at issue, the patient would have nevertheless consented to treatment.

Case 4. A 35-year-old musician sustains severe abdominal trauma. Gross hematuria is apparent. The traumatologist orders an intravenous pyelogram (IVP), following which the patient dies from an anaphylactic reaction despite appropriate treatment. His wheelchair-bound spouse files a law suit for the estate of the deceased, alleging a lack of informed consent, contending that if the decedent had been informed about the approximately 1:50,000 chance of dying from an IVP, more likely than not he would have refused the procedure, and she would have continued to benefit from her husband's musical skills.

The physician's medicolegal defense is that even with information about the risk of an IVP, the patient would have nevertheless consented because the immediate risk of dying from renal trauma far outweighed any very rare risk of death from an IVP.

A fourth defense, the "unduly alarming" defense, provides the physician with an opportunity to contend that material information was withheld in the patient's best interest to keep the patient from worrying over consequences while still opting for treatment.

Case 5. A middle-aged musical director has an established diagnosis of urate kidney stones and evidence of urate nephropathy. Treatment includes alkalinizing the urine, urging the patient to maintain hydration, and prescribing allopurinol in order to prevent further stone formation and to prevent or reduce the chances of renal failure developing from chronic urate nephropathy. Six weeks later, the patient develops toxic epidermal necrolysis (with corenal scarring and near blindness), a known and quite rare adverse reaction to allopurinol.

In this case, the physician has two medicolegal defenses based on long-term familiarity with the patient. The first would be the "so what" defense. The second defense would be the "unduly alarming" defense; that is, the physician did not tell the patient because he would have accepted the treatment in any event, but would have become unduly alarmed; thus, the patient would have become an emotional cripple from extreme worrying, insomnia, diarrhea, and anorexia. Acceptance of the "unduly alarming" defense by a jury would depend on a physician's ability to establish a credible knowledge of the patient's emotional character.

Physicians who treat and help members of the performing arts will find such patients understanding, cooperative, and grateful, especially when physicians maintain an awareness of whether the potential adverse effect of a drug might cause dystonia or hearing loss, and whether any treatment might impair the occupational effectiveness of a performing artist. Allowing the patient to participate in the treatment program through informed consent is a legal, ethical, and moral duty. Physicians should remain aware that a musician, dancer, or actor who cannot perform has lost both professional stature and earning power.

Primun non nocere. "First do no harm" is the first principle that should be applied in the practice of performing arts medicine.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

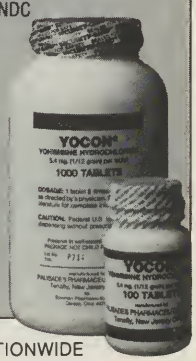
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

BCBSM executives meet with Med Chi leadership

"We are not in financial difficulty," said Frank Gunther, chairperson of the Board of Directors of Blue Cross and Blue Shield of Maryland (BCBSM). "We are financially solvent and do not have a liquidity problem." Mr. Gunther, accompanied by William Beasman, acting chief executive officer (CEO), and Arthur T. Keefe, Jr., M.D., vice president and corporate medical director, spoke to over 35 Med Chi physicians on February 24, 1993 in an effort to allay physician concerns about the stability of Maryland's largest insurer.

Financial concerns

Both Gunther and Beasman related events that occurred during the July 1992 hearings by describing the situation surrounding the discrepancy over the actual net worth of BCBSM. Mr. Gunther emphasized that, through the entire investigation, there were no indictments or evidence of criminal activity. He added that the U.S. Senate is not seeking further investigation. "The main concern among the general public was the financial stability of BCBSM," he said.

Mr. Gunther described how the valuation of CareFirst, a BCBSM subsidiary health maintenance organization (HMO), changed the overall worth of the company. "The insurance commissioner asked BCBSM to take over CareFirst," Mr. Gunther said. "We paid $32 million for CareFirst and counted that as part of our asset base. During the US Senate hearing, it was asked whether an asset is worth how much one paid for it or how much one can sell it for, which would require an outside impartial evaluation. The insurance commissioner then directed BCBSM to delete the $32 million until that evaluation was completed.

Another factor affecting the company's reported worth was the $42 million BCBSM had loaned its HMOs. "In April 1992, BCBSM signed an agreement with the insurance commissioner's office stating that BCBSM would amortize the $42 million over a six-year period." Following the US Senate hearing, however, Gunther said, "the insurance commissioner requested BCBSM to take the $42 million off the books for that year." As a result of these accounting changes, the reported net worth of the company dropped from $100 million to $26 million. A recent evaluation by Legg Mason values the worth of all of BCBSM HMOs at $80 million. "In fact, the HMOs generated over $10 million in profits during 1992," Gunther added.

Physician relation concerns

Med Chi President-elect Joseph Snyder, M.D. was among the physicians who posed questions to the BCBSM executives. "I've heard about your financial condition and your effort to improve service," he said, "but I'm concerned about BCBSM's relationship with it providers—the physicians. I'd like to see physicians have more input into the policies of your organization."

Mr. Beasman concurred with Dr. Snyder's concerns and said, "One of the things that shocked me when I became acting CEO was the poor provider relations. There was almost an arrogance in dealing with providers. I believe doctors are our customers and the customer is always right. BCBSM has to start treating its providers as customers. The providers are absolutely essential to our welfare, our future, and our survival. Without their cooperation, without their good will, we have no reason to be in business."

Mr. Gunther agreed. "We have to spend more time interfacing with providers. They are the lifeline of everything that we do. We have a number of board vacancies coming up, and we invite interested physicians to contact the nomination committee."

He added that current BCBSM bylaws state that physicians may comprise up to 25% of the board. Legislation pending in Annapolis (as of press time), however, may limit terms of board members and require 11 members of the current board to step down, leaving several vacancies.

Management concerns

Alan O'Shinsky, M.D., treasurer of the Maryland Society of Otolaryngology—Head and Neck Surgery, stated he, too, was concerned about provider relations. "I believe improving provider relations is essential to restructuring the company," he said. Dr. O'Shinsky added his concern that restructuring may be difficult as several top BCBSM executives have been removed. "Why did the board allow the company to get into such a state that they had to fire the top executives?"

Mr. Gunther replied that Carl Sardegna came to BCBSM eight years ago. He explained how Mr. Sardegna turned BCBSM into a financially sound organization. "In hindsight," said Gunther, "we found out that we addressed the financial issue and ignored the service issue. We reduced the number of people who help physicians track down claims and the amount of training our people had, and we did not make proper investments into new systems. It caught up with us."

Gunther added that a primary reason for the resignation of many top BCBSM executives was the service problem. "In 1998, the national BCBS put BCBSM on its watch list because of poor service. The board did not know this. When I became the chairperson of the board in October 1992, I received a letter from the national BCBS. The letter described a service commitment Mr. Sardegna had made to the national BCBS in April 1992. The letter basically said that BCBSM had not met the terms of the agreement. I knew nothing about this agreement."

To address this problem, Mr. Gunther traveled with Mr. Beasman to Washington, DC to meet with executives from the national BCBS. "They put a projection up on the wall that said we had been on probation since 1988. We knew nothing about it."

He added that the leadership was removed because Mr.

Sardegna withheld vital information from the board. "Mr. Sardegna's management style was to accentuate the positive and totally ignore the negative," said Mr. Gunther. "If it's good news, give it to the board, if it's bad news, fix it before the board finds out. The board was not aware that service had lapsed to the point that it had."

"Attention was devoted to building up the black ink," said Gunther, who added that the company might have been even more profitable if the board had been made aware of the excessive expenditures that occurred under Mr. Sardegna. "I found out that we spent between $5-6 million a year for outside consultants. These expenses were not approved by the board."

Service concerns

With regard to service, Med Chi Council Chairperson Joseph Fastow, M.D. commented that he had experienced difficulty with BCBSM assigning correct physician-provider numbers to new physicians. "We waited as long as nine months to get a new physician a provider number for Medicare. There is no reason why physicians should have to wait 90, 120 or 180 days before they are assigned a number."

Dr. Keefe addressed Dr. Fastow's concern stating that it is a recognized problem. "We are currently attempting to address that issue," he said. "Service is now our number one concern," added Mr. Gunther. "We have done a terrible job on service, and we have got to turn it around."

Mr. Beasman added that he believes the company will fare well under the leadership of William Jews as the new chief operating officer. "William Jews is a customer-oriented person," he said. "He will respect the interests of all our customers —both providers and subscribers."

At the conclusion of the meeting, the BCBSM executives urged physicians who did not have the opportunity to pose questions to submit them in writing. They also stated that BCBSM would do its best to answer physician questions and address their concerns. ■

BCBSM update

February 23, 1993 — By a vote of 134-1, the Maryland House of Delegates passes a measure placing strict state controls over BCBSM. The bill requires the insurer to

- disclose more of its financial records;
- maintain a cash reserve equal to one-month worth of premiums;
- restrict its business to health-related activities;
- include consumers on the board of directors; and
- limit the terms of BCBSM board members to six years. [1]

February 25, 1993 — The BCBSM board votes to revoke supplemental retirement packages for former Chief Executive Carl Sardegna and former Senior Vice President Fred M. Gloth, Jr. The cost of both supplemental retirement packages is estimated at $5.1 million. Frank Gunther, chairperson of the board, had said previously that the board approved the formula for the retirement packages but was not aware of the total cost. The board's decision came after a meeting with attorneys and after BCBSM received a letter from Attorney General Joseph Curran demanding BCBSM revoke the supplemental retirement packages. [2]

March 3, 1993 — BCBSM releases an accounting of its 1992 finances. Although the company's net worth dropped by 75% from the $100 million reported earlier in 1992 to $25 million on December 31, 1992, BCBSM did report a $40.8 million profit.

According to the *Baltimore Sun,* BCBSM subsidiaries earned $10 million. Maryland insurance regulators required BCBSM to adhere to strict insurance industry accounting standards—this is one reason for the change in the company's net worth.[3]

March 5, 1993 — The *Baltimore Sun* reports that enrollment for BCBSM-owned HMOs dropped 6% in 1993. Despite this loss, BCBSM HMO revenues increased 5% and profits grew by 160%. The four plans—Columbia, Free State, Potomac Health, and CareFirst—lost approximately 16,000 members.[4]

March 6, 1993 — The *Baltimore Sun* reports that the Health Services Cost Review Commission (HSCRC) learned BCBSM received $20 million from discounted hospital rates it receives for its role as an insurer of "last resort." Because BCBSM offers open enrollment to everyone—including those who cannot get health insurance because they are considered a bad risk—the company receives special benefits, such as a 4% discount on hospital bills. According to HSCRC, BCBSM reported it could not distinguish between the cost of care for those who participated in open enrollment and other subscribers. HSCRC learned, however, that BCBSM separated the costs for these groups in information provided to state insurance regulators. The data showed that only $2 million of the $26 million in hospital bills was incurred by individuals participating in open enrollment during 1991. John M. Colmers, HSCRC executive director, told the *Sun* that his agency will investigate this matter further.[5]

March 9, 1993 — BCBSM announces that its special investigations unit recovered $2.4 million from fraud and abuse probes during 1992, a 50% increase over 1991 recoveries. The unit also recorded more than $1 million in "avoided payments" in 1992. These are payments BCBSM would normally have paid to health care providers or subscribers if the unit had not detected fraud or abuse.

"The dramatic increase in recoveries can be traced to a new emphasis on special studies," said William G. Stephens, director of the BCBSM special investigation unit, in a BCBSM news release. "To conduct a special study, we select a certain medical procedure and determine how often a provider administers the procedure. If the provider's average billing for that procedure far exceeds his or her peers', we investigate." Most of the special studies uncovered cases of abuse, according to Stephen. "Abuse can include instances where a health care provider renders inappropriate or unnecessary service or overcharges for a service. Fraud cases generally involve a higher dollar amount and can include charging for services not rendered, billing for a higher level of service than was rendered, and accepting bribes or kickbacks for referring patients," said Stephens.

March 18, 1993 — BCBSM announces it will discontinue MEDCASH, a health care credit card introduced in 1988. The insurer sold the outstanding balance portfolio to Key Federal Savings Bank. "The sale is another step in our efforts to move the company back to its basic mission of providing health insurance to the people of Maryland," said John A. Piccotto, senior vice president and general counsel for BCBSM, in a company news release.

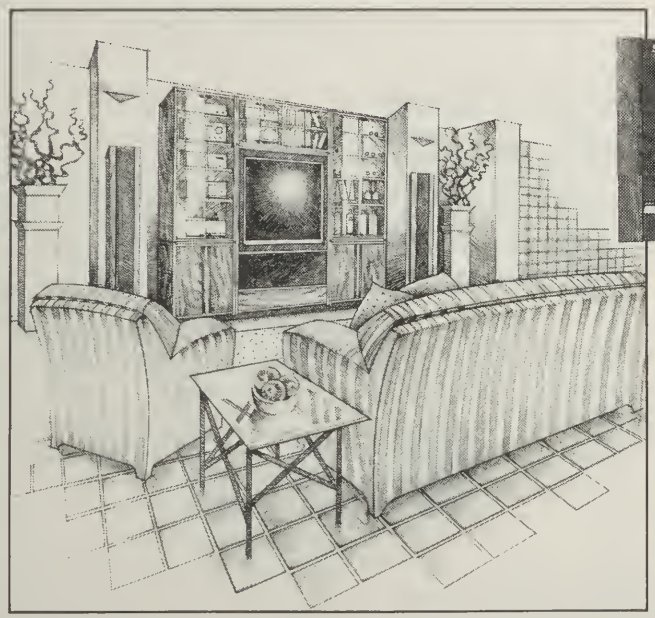
A Clinical Moment with Diabetes

Foot care for the patient with diabetes

Doctor, I am 58-years old and have had diabetes for two years. I recently saw my orthopaedic foot specialist because of an infection on my toe. He was very concerned about the infection, and warned me that this may lead to amputation of my toe. Is there anything that can be done to prevent this?

Your doctor's concern was quite appropriate. You are certainly at increased risk for infection, and once this becomes established, it tends to be a much more serious problem than in the nondiabetic patient. There are three major factors that contribute to the development of infection in your feet. The first is poor circulation or peripheral arterial disease, the second is neuropathy or a decreased sensation, and the third is an increased susceptibility to infection. All of these factors contribute to an increased risk of ulcers and infection in your feet.



Antibiotics are required for treatment and, depending on the severity of the infection, are administered orally or intravenously. Once the infection is under control, it is essential that you take care of your feet on a daily basis. The infection may begin in what is apparently a trivial crack in the skin, frequently near the nail. It is important to inspect your feet daily; if you are unable to see the bottom of your foot, use a mirror. Due to the neuropathy, the skin loses its texture and moisture. The skin becomes dry and commonly cracks, allowing bacteria to enter resulting in infection. You should, therefore, replace the natural moisture of the foot by soaking the foot daily in warm, *not hot*, water for 15 minutes, followed by rubbing in Vaseline (petroleum jelly) to replace the natural oils of the skin. You should not walk barefoot and must pay attention to shoe wear. Soft inserts or cushions (orthotics) in the shoes will pad the bottom of the foot, preventing ulceration and infection. Surgery may be necessary to correct severe deformity that cannot be controlled with appropriate shoe wear. By careful attention to your feet, you can prevent corns, callouses, and bony prominences from developing into more serious infections. Inspect shoes daily for any nail points, torn linings, or loose and foreign objects. Toenails, corns, and callouses should be given appropriate care by a professional. Seek medical care promptly, even for what appears to be a minor callous or an infected ingrown toenail, to prevent more serious consequences such as amputation.

The Best Seat In The House.

The NEW TA-AV670 Integrated Amplifier from Sony.

With Sony's advanced Digital Signal Processing, you can create the acoustics of a Stadium, Theater, Concert Hall, Jazz Club and more. Designed to integrate all your audio and video components into one sophisticated system controlled by one remote, this state-of-the-art amplifier incorporates the movie theater sound of Dolby Pro Logic Surround processing, high power and unprecedented control flexibility. With the NEW TA-AV650, the best seats in the house, are in your house.

For a complete home theater system, call the *Audio Architects*™ at Soundscape. Free, expert telephone consultations available.

STATE OF THE ART

DIAGNOSTIC TECHNOLOGY

Magnetic resonance imaging (MRI) is an important tool for today's physician. MRI produces VIVID images of the body in multiple planes. It is a painless procedure that does not involve surgery or potentially harmful radiation. MRI is frequently recommended for evaluation of neural, spinal, articular and pelvic disorders. It is safe and cost effective, and its various applications are being expanded at an impressive rate.

Health Images facilities are a community resource available to all area physicians.

Imaging Case of the Month

A 79-year-old, African-American male presented with an acute exacerbation of chronic back and leg pain and with an increase in leg weakness. He was afebrile, with a normal hematocrit and white blood cell count. His sedimentation rate was elevated to 47.

Radiographs and a magnetic resonance imaging (MRI) examination of the lumbosacral spine were obtained and followed by surgical decompression and biopsy.

Tuberculous osteomyelitis, discitis, and epidural abscess

Figure 1. A lateral radiograph shows vertebral end plate destruction around the L4/5 disc (arrows) and lysis of the adjacent vertebral bodies, L4 more than L5. Resultant loss of anterior and middle column stability allows for a mild spondylolisthesis.

Figure 2. A sagittal T_1 weighted MRI scan shows loss of normal high signal (white) marrow at L4 and L5, replaced by lower signal inflammatory cells and edema. (arrows)

Figure 3. A sagittal T_2 weighted MRI scan shows a paradoxical high signal in the L4/5 disc (asterisk), a signal characteristic usually found in normally hydrated discs, lacking in degenerated desiccated discs, and returning in the edematous, infected disc. Note the pre-vertebral and intraspinal, ventral extradural abscess (arrowheads) with resultant spinal stenosis and caudal root compression.

The clinical presentation, and the radiographic and MRI findings in this patient are typical of vertebral osteomyelitis and discitis, although not specific for infection with mycobacterium tuberculosis. In both pyogenic and tuberculous spinal infection, hematogenous seeding is most common from sites in the respiratory tract, skin, and genitourinary tract; *Staphylococcus aureus* is the most common bacterial agent. In tuberculosis, the site of original infection may be active or quiescent, as in this patient. The infectious organism spreads from end arterioles in the metaphyseal portion of the vertebral body just beneath the end plate and may spread vertebral body to vertebral body via intermetaphyseal arteries, initially skipping the less vascular disc.[1]

The corresponding radiographic changes often occur slowly, beginning with erosion of the vertebral end plate, followed by bone lysis in the vertebral body itself and by progressive collapse and resultant deformity. The infectious spondylitis is reflected in MRI changes, as well as radionuclide bone scanning with technetium 99m hydroxydiphosphonate; Modic et al report that osteomyelitis appears at approximately the same time on these two modalities.[2] MRI provides additional information about paraspinal and intraspinal extension of abscess and resultant compression of neural structures, and is therefore often preferred to radionuclide bone scanning for evaluation of spinal infection. The typical early MRI changes of discitis and osteomyelitis, decreasing in signal on the T_1 weighted sequence and increasing in signal on the T_2 weighted sequence on either side of a disc with irregular end plates, are not entirely specific and may be confused with the inflammatory stage of osteoarthritis.[1]

This confusion is more likely with tuberculosis because the intervening disc may remain low signal (typical of a degenerated disc) rather than high signal (typical of an infected disc), because of a lack of proteolytic enzymes that would involve and inflame the disc.

Smith et al report that only 25% of patients with tuberculous spondylitis have abnormal signal in the discs on T_2 weighted MRI.[3]

This patient, with more advanced disease and accompanying discitis, is one of the minority of cases with abnormal disc signal. Because tuberculous spondylitis takes longer to develop, vertebral body destruction and deformity may be greater, and larger paraspinal abscesses may develop.[4]

In this patient, decompressive laminectomies of L4 and L5 revealed caseous material that ultimately grew mycobacterium tuberculosis, not present on original acid fast stain. Treatment with INH (isoniazid), rifampin, pyrazinamide, and ethambutol, as well as the surgical decompression, resulted in clinical improvement. The decision for surgery, in addition to antibiotic therapy, rests on the assessment of spinal stability and neural compression.[5]

With the recent increased incidence of the disease, especially in the immunocompromised population, we must remember tuberculous spondylitis and the appropriate imaging modalities and treatment options to effect a cure.

Treatment of panic disorder: Summary of the NIH consensus statement

Panic disorder with and without agoraphobia is a debilitating disorder that may afflict as many as three million people in the course of a lifetime. It is characterized by panic attacks, which are bursts of terror that seem to come out of the blue. People suffering from a panic attack often think that they are having a heart attack or that they are losing their minds. Secondary to the occurrence of these unexpected panic attacks, panic sufferers often develop agoraphobia and consequently begin to avoid places where they fear a panic attack may recur. If the agoraphobia becomes severe enough, a person may become housebound.

Research gathered in recent years indicates that selected psychopharmacologic and psychosocial treatments are effective in people who have panic disorder, with or without a history of agoraphobic avoidance.

Two classes of antidepressant medications (tricyclics and monamine oxidase inhibitors) and several high potency benzodiazepines (alprazolam, clonazepam, and lorazepam) have been found to be effective, particularly in the short run, in reducing or eliminating panic attacks associated with panic disorder. However, pharmacologic agents may present problems such as undesirable side effects, the risk of dependence, and a significant relapse rate once medications are discontinued.

Research continues on other medications that may prove useful in the treatment of these conditions. Initial indications are that some of these other agents, particularly the serotonin uptake blockers, may be effective panic medications.

Several variations in a cognitive-behavior approach to treatment also have shown significant efficacy in the reduction and/or elimination of panic attacks. Published reports from several research centers indicate that a vast majority of patients are panic-free at the end of a course of cognitive-behavioral treatment, and some data suggest that these benefits last for up to two years after treatment is ended.

Information is sparse or nonexistent on such issues as (1) the effectiveness of combined psychosocial and pharmacologic treatments, (2) the mechanisms of therapeutic action, (3) individual patient factors that may have predictive value in terms of outcome, (4) the long-term effectiveness of treatment for panic disorder, and (5) the effectiveness of treatment for other problems associated with panic disorder and agoraphobia.

To help resolve questions surrounding these issues, the National Institutes of Health (NIH), in conjunction with the National Institute of Mental Health (NIMH), convened a Consensus Development Conference on the Treatment of Panic Disorder on September 25-27, 1991. A consensus panel composed of experts in psychiatry, psychology, cardiology, internal medicine, and scientific methodology, as well as members of the general public, considered the scientific evidence presented by a number of experts in relevant fields. The panel formulated a consensus statement in response to the following five questions:

- What are the epidemiology, natural history, and course of panic disorder with and without agoraphobia? How is it diagnosed?
- What are the current treatments? What are the short-term and long-term effects of acute and extended treatment of this disorder?
- What are the short-term and long-term adverse effects of these treatments? How should they be managed?
- What are considerations for treatment planning?
- What are the significant questions for future research?

The panel concluded that

- panic disorder is a distinct condition, with a specific presentation, course, and family history, for which there are effective pharmacologic and cognitive-behavioral treatments;
- treatment that fails to produce an effect within 6 to 8 weeks should be reassessed;
- panic disorder patients often have one or more existing mental conditions and thus require careful assessment and treatment; and
- the most critical research needs include
  - the development of reliable and valid measures of assessment of panic phenomena,
  - the identification of optimal choices and structuring of treatments designed to meet the varying individual needs of patients, and
  - the implementation of basic research to define the nature of the disorder.

In the consensus statement, the panel alluded to several other research needs, including

- the investigation of treatment-resistent patients,
- the investigation of combined pharmacologic and psychosocial treatments for patients who have panic disorder with and without agoraphobia,
- long-term follow-up studies,
- investigations of the mechanisms and processes of change, and
- treatment studies with panic disorder patients who have coexisting mental disorders.

Finally, the panel recommended that NIMH mount an aggressive educational campaign to increase awareness of panic disorder among clinicians, patients and their families, the media, and the general public. On November 13, 1992, NIMH

launched a three-year panic-education campaign that will include the production and dissemination of print and audiovisual information materials for the lay public, health care professionals, and employers about the symptoms and treatment of panic disorder. NIMH will collaborate with professional societies, mental health organizations, and the media to achieve the goals of the campaign.

Free, single copies of the complete NIH consensus statement on treatment of panic disorder may be ordered from the Office of Medical Applications of Research, National Institutes of Health, Federal Building, Room 618, Bethesda, Maryland 20892 (301-496-1143). ■

Panic disorder: A commentary

Panic disorder is an illness that has only recently been recognized as a distinct disorder. This diagnosis is made exclusively on the clinical presentation. Typically, the patient complains of discrete episodes of intense, unbearable anxiety with associated physical symptoms (palpitation, tremors, chest pain, dizziness) and a fear of dying or going crazy. This may or may not be complicated by agoraphobia, which is an avoidance of places or situations where escape might be difficult should a panic attack begin. Other psychopathology that can be caused by panic disorder and complicate the picture include generalized anxiety, demoralization, depression, and substance abuse. Secondary occupational and social morbidity is also common.

The importance of correct and timely diagnosis is underscored by the fact that panic disorder is quite treatable. The National Institutes of Health (NIH) consensus statement points out that there is solid evidence that three different classes of medications are effective in panic disorder, as is cognitive-behavioral psychotherapy. The medications—tricyclic antidepressants, MAO (monoamine oxidase) inhibitors, and high potency benzodiazepines—each have their particular advantages and disadvantages. The benzodiazepines—alprazolam, lorazepam, and clonazepam—work very rapidly with minimal side effects other than drowsiness. They have the disadvantage of being potentially addicting and are probably better in the short run than the long haul. The tricyclics and MAOIs are easy to dose, have no problems with dependence, and are reliably effective. They have the problem of frequent side effects (anticholinergic symptoms, sexual dysfunction, hypotension) and take two to four weeks to become effective. One useful pharmacological strategy is to begin treatment with a high potency benzodiazepine, then bring a tricyclic on board, tapering the benzodiazepine once the tricyclic has reached therapeutic levels.

The use of cognitive-behavioral psychotherapy to treat panic disorder is well studied. The advantages of this approach are that it is focused, time limited, and cost effective. The major limitation is that any underlying conflicts that may have predisposed to the panic attacks will likely be missed. While the consensus statement does say that psychodynamic psychotherapy "may be helpful for other difficulties the patient presents," the de-emphasis on a psychodynamically informed approach is conspicuous in this report. In our experience, psychodynamic psychotherapy is a useful approach to panic disorder, although this is usually best undertaken after the florid symptomatology is under better control.

As the consensus report emphasizes, education of both doctor and patient is crucial. The primary care doctor needs to recognize this common syndrome because most patients present to the internist or family practitioner. Of course, physical disorders such as cardiac, vestibular, thyroid, or other endocrine disorders (e.g., pheochromocytoma) need to be considered, as do stimulant abuse or alcohol withdrawal. The main problem with the uneducated doctor is that once the physical conditions are ruled out, he or she misses the diagnosis or decides it is "all in the head," "just nerves," or "simply stress." A treatable patient is left to suffer needlessly. The patient also needs to be educated about the illness. Oftentimes, naming and clarifying the condition goes a long way toward reducing secondary anticipatory anxiety and demoralization. A well-educated patient then becomes the best ally in determining an appropriate treatment plan tailored to his or her needs.

Whatever treatment is undertaken, if it is not effective within six to eight weeks, the diagnosis and treatment plan need to be reconsidered. If one of the pharmacological strategies have not been tried at that point, it should be strongly considered. Since a large percentage of patients with panic disorder have a comorbid psychiatric condition, referral to a psychiatrist is usually indicated.

Strategies for further research into panic disorder were outlined in the consensus statement. Of course, we eagerly await the time when we have more definitive data on etiology, pathophysiology, course, and treatment. But now, today, we have a clearly definable clinical syndrome that responds rapidly and robustly to our current treatments. We applaud the NIH in making **education** about panic disorder its first priority in this condition.

WORD ROUNDS

Bart Gershen, M.D.

Turning points

We inhabit a tilted, whirling globe.

Of course, those of us perched awkwardly on its surface are not aware of this tilt. Careful measurement of earth's north–south axis relative to the sun confirms the incline. We are, in fact, angled some 23.5 degrees from our aging star.

In summer, the northern half of earth slopes toward the sun. In winter, it leans away. On June 21 of every year, the sun hovers directly above the latitude 23.5 degrees north of the equator. It is known as the Tropic of Cancer. Similarly, on December 22, the sun is directly above the Tropic of Capricorn, 23.5 degrees south of the equator.

On that first day of winter, the sun reaches its lowest point in the sky. Thereafter, it begins to rise higher and higher above the horizon. On reaching its summer zenith, the sun begins a slow daily descent, again touching its nadir on December 22.

This annual ritual is repeated inexorably. But a curious phenomenon occurs as the sun reaches the limit of each excursion—winter or summer. It appears to *pause* at that position for a few days before starting to backtrack. This apparent hesitation is known as the summer or winter **solstice.** (From the Latin *sol* 'the sun' and *sistere* 'to pause or stand'—that is, the sun appears to **stand still** above the horizon. Armi**stice** has the same terminal root meaning, "a pause or stoppage of arms"—an archaic term we have little use for today.)

The latitude at which a solstice occurs is known as a **tropic**—the place where the sun "turns" in the sky. (Greek **tropos** 'a turning'—e.g., **phototropic:** turning of plants toward light.) We call the zone that lies between the two turning latitudes (Tropic of Cancer and of Capricorn) "the tropics."

On the first day of fall or spring, the sun will be found directly above the equator—the autumnal and vernal **equinoxes.** Days and nights are each 12-hours long. (Latin *aequus* 'equal' + *nox* 'night').

Ancient astronomers carefully studied the motion of the sun, moon, and five visible planets. They also examined collections of distant stars that they called **constellations** (Latin *con* 'together' + *stella* 'stars'), often imagining them to be animals, such as Ursa Major (the bear), Taurus (the bull), Leo (the lion), and **Cancer** (the crab).

As a term for malignancy, however, **cancer** was first used by Galen. He described a breast tumor this way: "Just as a crab's feet extend from every part of the body, so in this disease the veins are distended, forming a similar figure." The hardness of the tumor advanced the simile, suggesting the crab's shell. (The Greek word for crab, *karkinos,* provides us with **carcinoma.**)

Painful, indurated oral ulcerations, although nonmalignant, were also named for the crab. They were called **cankers.** Furthermore, the French called the hardened primary lesion of syphilis a **chancre** in resemblance to these seashore arthropods. Thus **cancer, canker,** and **chancre** are all rooted in the same crustacean metaphor.

Early astronomers had also noted that **eclipses** of the sun or moon all happened within a very narrow segment of the sky. They referred to this slender band as the **ecliptic.** It corresponds to the annual bouncing ball of sun as it meanders through the heavens. (**Eclipse** from the Greek *ek* 'out' + *leipein* 'to leave'—that is, during an eclipse, the moon or sun is "left out" of the sky.)

Within the ecliptic pathway, 12 constellations were discovered—one for each month of the year. The astronomers named most of these constellations for animals. The collection of 12 was called

the **zodiac** (Greek *zoidion* from *zoion* 'animal'—as in **zoology**—plus *kuklos* 'circle'. Hence, the zodiac is "a circle of animals.")

Return for a moment to the root word *tropos*. Greek mythology speaks of **Atropos**—one of the Three Fates—who, with her macabre sisters Clotho and Lachesis, controls the destiny of every human. Clotho carries a spindle and onto it she spins the thread of life. Lachesis measures and determines its ultimate length. **Atropos** cuts the thread. There is no turning back. (Greek *a* 'not' + *tropos* 'turning'.)

Atropine ($C_{17}H_{23}NO_3$), an alkaloid found in *Atropa belladonna,* is a member of the deadly nightshade family. It is named for the venomous sister **Atropos.** Administered in a sufficient dose, it too will cut the thread of life.

The nightshades are plants within the order ***Solanaceae,*** from the Latin *sol* 'the sun'. This order embraces prominent dietary staples including the Irish potato, the red pepper, and the tomato. Included as well is the tobacco plant and the Jimson weed. The latter plant, *Datura stramonium,* with its companion *Datura meteloides* (the **locoweed**), is frequently responsible for poisoning small children and animals. Jimson was first detected around Jamestown, Virginia, and called Jamestown weed. Through the years, its name has been shortened to Jimson weed. Its leaves, flowers, and seeds contain up to 0.45% belladonna alkaloids, mostly atropine, hyoscyamine, and scopolamine. **Locoweed,** from the Spanish *loco* 'crazy', contains mainly scopolamine.

The toxicity of belladonna plants has been known for centuries. During the period of the Roman Empire and later, in the Middle Ages, they were often exploited for political assassination. Hamlet's father was even said to have been poisoned by a mixture of **Henbane** poured into his ear by brother Claudius. (If you harbor doubts about the efficacy of this method of envenomation, ask yourself what might happen in the event of a ruptured tympanic membrane, and a patent Eustachian tube.)

Henbane is officially known as *Hyoscyamus niger,* and is a chief source of the belladonna alkaloid **hyoscyamine.** (Greek *hyoskyamos* 'pig bean', a reference to its obnoxious odor.) The name **henbane** alludes to its effect on chickens. *Bane* is old English meaning 'deadly poison, the cause of death or ruin'—as in, "it's the **bane** of my existence." **Dogbane** has a similar infsinuation.

All belladonna alkaloids act as anticholinergics and antimuscarinics. **Cholinergic** refers to the neurotransmitter **acetylcholine. Muscarine** is an alkaloid first derived by Schmiedeberg in 1869 from the toxic mushroom *Amanita muscaria. Muscaria* is Latin for 'pertaining to flies'. For years, extracts of the mushroom had been used as a natural pesticide known to kill flies. (Latin *musca* 'fly'. In Spanish: *mosca* from which the diminutive term **mosquito**—"little fly"—derives.)

Acetylcholine is the neurotransmitter released by stimulating pre- and postganglionic fibers of the parasympathetic nervous system. Muscarine duplicates the effect of such stimulation, and atropine inhibits these muscarinic effects. (The nicotinic action of acetylcholine on the somatic motor terminals is not blocked by atropine at usual doses.)

The parasympathetic nervous system includes neural outflow from the midbrain via the nucleus of **Edinger-Westphal** and the oculomotor nerve. (**Ludwig Edinger**, 1833-1918, was a German neurologist who founded comparative neuroanatomy. **Karl Friedrich Otto Westphal,** 1833-1890, was the first professor of neurology appointed in Berlin. He described the nucleus in adults two years after Edinger had initially described it in a fetus.)

In addition, the parasympathetic system includes elements of the 7th (chorda tympani), 9th, and 10th (vagus) nerves. (Latin *vagus* meaning 'wandering', a reference to the meandering, lengthy course of the nerve. Someone who is **vague** also meanders in a discursive, rambling fashion—from the same root.)

Within the intestine, the vagus fibers innervate **Auerbach's** and **Meissner's** plexuses, releasing acetylcholine from their postganglionic terminals. (**Leopold Auerbach,** 1828-1897, was professor of neuropathology in Breslau, Germany. **Georg Meissner,** 1829-1905, was professor of anatomy and physiology at Basle and Gottingen. In addition to describing the submucous plexus in the gut, he also described the touch nerve-endings in the skin, called **Meissner's** corpuscles.)

The parasympathetic system ends with sacral nerves II–IV innervating bladder, rectum, and sexual organs. Atropine blocks the cholinergic-muscarinic effects of this system, with several resultant consequences. As the dose reaches increasingly toxic levels: sinus tachycardia, dryness of the mouth, mydriasis, blurring of vision, difficulty in swallowing, hot and dry skin, ataxia, restlessness, hallucinations, delirium, coma, respiratory arrest, and death.

Classic atropine toxicity may be described as "hot as a hare, blind as a bat, dry as a bone, red as a beet, and mad as a wet hen."

Scopolamine derives from plants of the genus *Scopolia,* named for the Italian botanist **G.A. Scopoli.**

Belladonna (Italian 'beautiful lady') stems from its earliest use as a cosmetic. It guarantees beautiful eyes with very large pupils.

These, too, have been known to be turning points. ■

Book Reviews

All God's Mistakes. Genetic Counseling in a Pediatric Hospital. Charles L. Bosk. Chicago: The University of Chicago Press. 1992. 195 pages. $24.95

Prenatal investigation of parents who may carry defective genes has manifold ramifications for these individuals. A retrospective glance at the specialty of pediatrics illuminates the fact that the lives of countless children have been markedly changed by the medical advances in the diagnosis and treatment of infectious diseases during the last century. As success was achieved in these contagious diseases, the emphasis shifted to genetic disorders and those ailments resulting from the effect of toxic environmental conditions on the developing fetus.

Progress, however, has not been made in these areas without the simultaneous creation of other problems and difficult choices for parents, families, and providers of health information. The subspecialties of neonatology and genetic counseling have been motivated by the specific need to deliver better health care to the contemplated child or fetus. In this process, economic, legal, and ethical anxieties have been encountered.

Birth defects have their origin in faulty chromosomes. Every human cell contains about 6 feet of deoxyribonucleic acids (DNA) or six billion base pairs packed into its 46 chromosomes. Given the amount of coding information passed from each parent to child, the chances for aberration are considerable. These mutations are quite apart from recognized defects in which chromosomal abnormalities are firmly imbedded in the genetic code.

The advertisement on the cover jacket of *All God's Mistakes* states that the author has shaped "a remarkable account of the clinical applications of human genetics in medicine. His finely drawn observations form the basis for an often provocative portrait of the scientific, ethical, and professional conflicts that surround the use of the new technologies of conception and prenatal diagnosis." These statements constitute an ambitious promise. By case use, the author is said to have "revealed the process by which physicians and other health professionals come to make decisions about pregnancies."

Bosk, a professor of sociology, is an ethnologist. The latter term is defined as an individual who studies the division of mankind into races; their origin, distribution, and relations; and the peculiarities that characterize them.

With this background, he was invited in 1976 to witness, over a period of three years, the deliberations of a small group of genetic counselors who were also physicians. Help was afforded by a cytogenetics laboratory that employed amniocentesis and carried out basic research. The report of his preliminary work led to further experience funded by a federal agency. Intense observation lasted until 1978, and then another much shorter period of observation ensued in 1980. All of the information provided by Bosk must be considered in that time frame. The book, however, was not published until 1992.

The modus operandi of the genetic-counseling team consisted of the transfer of pertinent information to requesting individuals. The individuals were then expected and permitted to make their choices about further activity. The counselors acted much in the manner of a supreme court. The judges listened to the evidence, retired to their chambers to deliberate, and then presented their collective, scholarly opinion to the prospective parents. From a bizarre viewpoint, they were intelligent bookmakers who quoted the odds on the appearance of the specific defect or disease under consideration. Then, the parents opted for their course of action. Certainly, difficult de-

cisions by counselors and parents were involved.

Bosk was asked to make an objective assessment of how the group handled its problems. In addition, he was asked to catalogue typical difficulties that could not be solved due to a lack of adequate resources. The work of the counselors was particularly formidable as they could offer only second-trimester abortion, a highly-contested medical and legal procedure, as treatment.

Despite the medical abilities of the consulting group, their universal response to the unsophisticated couple's question of "What should we do now?" was a didactic lecture. The counselors informed the couple that only the couple could know what was right for them to do. Counselors wanted their patients to make their decision after the couple possessed the total available information on the subject. The counselors stressed that these issues were personal, familial, and not for a professional relationship.

Such advice led to a multitude of dilemmas. Couples to whom clear directives could not be given, couples to whom clear direction was proposed but which occasioned intramarital dispute, and couples provided with clear directions but who then chose to ignore the directions, posed three distinct problems. The overriding mandate of the group prevented further help to the patients at this point. The counselors, however, wanted the couples to be comfortable with the information provided and worked to assure themselves that the patients' professed comfort was genuine.

Genetic misadventures are merely mentioned in passing, with little practical information. For the physician or student who wishes to learn the more recent innovations in applied genetics, Bosk offers nothing, and, in retrospect, could not be expected to do so in light of his training. The subtitle of his book, *Genetic Counseling in a Pediatric Hospital*, is totally misleading.

Certainly the health professions are interested in informing the public about current thinking of the intrauterine formation of a child. The present state-of-the-art has made tremendous advances since Bosk gathered notes for his book. Couples desirous of having a child and who may be at risk have a right to know that such is present and how great it is. This information cannot be delivered on a platter, however, and left for consumption and digestion. Somehow, Bosk, not being a medical practitioner, has not acquired that special relationship necessary for good medical practice. These periods of indoctrination are very difficult for the couple, and the couple is worthy of love and support during their trial. The fear of malpractice has pushed the counselors into a defensive type of medicine. If the patients must make the decision about the further conduct of pregnancy, the counselors are free to blame despite the eventual outcome.

This reviewer does not recommend the purchase of *God's Mistakes*. Its advertising prose is totally misleading and the contents do not provide any substantial information about the field of clinical genetics.

Alcoholism. Conspiracy of Silence. Leo P. Hennigan, M.D. Bethesda, Maryland: Gannel Publishers. 1989. 170 pages. $17.95

The author give the reader an autobiographical, blow-by-blow account of his travails and travels through the realm of alcoholism, which lasted about 27 years. He relates his story in plain, matter-of-fact terms using a simple style, and he wonders how a doctor treated by physicians could not have had his problem resolved sooner. The book is a witness to the fact that a hard-core alcoholic can be redeemed, and a satisfactory life recreated.

Leo P. Hennigan, M.D. is well qualified to write this book. After graduating from Georgetown University Medical School, he opted for training in psychiatry and is now a practicing psychiatrist.

The book is an expanded version of his thoughts presented in the *Maryland State Medical Journal* in 1980.[1] The dominant theme of that paper was that Alcoholics Anonymous (AA) offered a way of life as an undeniable substitute for drinking. The underlying therapeutic principle in AA is that one alcoholic helps another after establishing an identity as an alcoholic and relating his/her story. A group of anonymous strangers thus meets to accept and care for the new group member without moralizing, criticizing, or judging. They form a quiet, powerful, and effective therapeutic weapon. The 12 steps that make AA work show the worth of one individual helping another to obtain sobriety.

Unquestionably, the United States is a drinking society, as is evidenced by the great number of places where alcohol may be purchased or consumed. Of the 175 million Americans who use alcohol, about 10 to 13 million are alcoholics, and they constitute the greatest medical and social problem facing our nation. The disease receives little attention in medical schools, and physicians in AA refer to alcoholism as the 4-2-1 disease; in most **four**-year medical schools only about **two** hours of the total curriculum are spent on the number **one** health problem. Of the 85 responses that Hennigan received from medical schools in a study about their alcoholism programs, 10 were judged to have good programs; 25, fair; 43, poor; and 7, too vague to evaluate.

He thinks alcoholism is a disease characterized by denial. He protests the unwritten law of medicine that states, "Thou shalt not diagnose alcoholism un-

til it is in its advanced stages." Frequently, doctors, parents, and spouses fervently deny the presence of alcoholism in an individual with bizarre behavior associated with drinking.

A vast literature has accumulated about the subject, but Hennigan maintains that, despite the fact that it is the number one health problem, most Americans do not appreciate its gravity. He has gathered a fearsome list of statistics (**Table 1**) to illustrate his point.

Table 1. Association of untoward incidents with alcoholism

Incidents	Percentage
Fire deaths	80
Drownings	65
Home accidents	22
Falls	77
Pedestrian accidents	36
Arrests	55
Suicides and homicides	25–33
Divorce and juvenile delinquency	30
Child abuse	90

He makes five promises in his introduction:

1. The reader may easily understand what he writes.
2. Alcoholism is presented from a unique perspective.
3. Answers, not questions, are presented.
4. Alcoholism is not a complicated disease.
5. Every individual, regardless of educational background, may become a member of the therapeutic team to change alcoholism from a devastating health problem to an easily diagnosed and treatable disease.

Curiously, Hennigan believes the following statements about alcoholism to be false:

1. The alcoholic individual cannot be helped unless he or she confesses its presence.
2. The alcoholic individual must desire to stop drinking.
3. Alcoholism is complicated and difficult to treat.

He is, however, not always convincing in defending his beliefs, particularly with regard to the thought that alcoholism is not a complicated disease; this is not generally accepted.

The AA concept that alcoholism is a disease is not universally shared. Some therapists believe that a state of mind should not be confused with the pathologic changes incident to drinking. Modern holistic medicine, however, regards any disturbance of body function as a health disturbance or disease.

Hennigan defines the numerous manifestations of alcoholism in a simple manner. He gives credit to AA for the stabilization of his life and countless others, but he does not relate the specifics of how AA produced these recoveries. The acceptance and use of the 12 traditions of AA are said to be responsible for beneficial therapeutic changes.

The essence of AA supportive treatment is the belief that sobriety can be regained by the recognition of God or a supreme authority as the ultimate guide in human living and that this supreme being's support must be sought continuously in the conduct of life. Having accepted this concept, the flaws of the individual ego and the hurts inflicted upon others must be recognized and corrected. As an anonymous person in an open meeting of AA, the alcoholic individual discusses the problems of character and drinking that led to a loss of sobriety.

Consciously or not, AA has adopted a game plan for therapy paralleling the faith and hope presented by christianity. Recognition of a supreme being is the keystone of almost all religious beliefs. If the alcoholic accepts the premise and recognizes that the flaws of living may be eradicated with sustained hope in a supreme being, a tremendous change occurs. AA claims that 50% of regular attendees stopped drinking within a reasonable period, and that a further 25% did so eventually. This is an extraordinary rate of recovery.

Drug therapy for alcoholism has been fruitless, but such is not true for therapy or its complications. Taking Antabuse (disulfiram) is a threat to the drinking patient and not a means of direct therapy, as its combination with alcohol induces severe nausea and vomiting, but does nothing for the basic craving.

AA states officially that alcoholic individuals are men and women who have lost the ability to control their drinking, and that a true alcoholic individual never regains control but remains in the grip of a progressive disease. Despite the phenomenally high recovery rate attributed to AA activity, the members of the group maintain that alcoholism cannot be cured but only held in abeyance by accepting and using the AA philosophy.

Although Hennigan thought that doctors were negligent in the recognition and treatment of his alcoholism, he must have been elated by the actions of the American Medical Association (AMA) and its subdivisions; by 1984, every state medical society had formed a committee to ensure safe and competent care for alcoholic physicians.

This book will be an excellent addition to the library of the primary care practitioner and those para-medical individuals interested in the treatment of alcoholism. For sufferers from the disease, the book will provide inspiration and help to live with the disorder in a proper way.

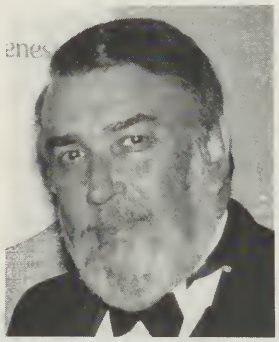
Members in the News



MICHAEL M.E. JOHNS, M.D. has been elected to the Nominating Committee of the American Academy of Otolaryngology—Head and Neck Surgery. He is currently dean of the Johns Hopkins University School of Medicine and vice-president for medical affairs at the Johns Hopkins University. Dr. Johns received his bachelor degree from Wayne State University in Detroit, and his medical degree from the University of Michigan Medical School. He completed an internship and residencies in surgery and otolaryngology in Ann Arbor. Dr. Johns also served in the United States Army Medical Corps as assistant chief of the Otolaryngology Service at Walter Reed Medical Center. He has served on many editorial boards, and has just recently been appointed editor of the *Archives of Otolaryngology—Head and Neck Surgery*. Dr. Johns has also served as member and officer of many professional associations.

STANLEY A. KLATSKY, M.D. has been named director of the new section of cosmetic surgery at the Johns Hopkins School of Medicine. He is presently an assistant professor of plastic surgery at the Johns Hopkins University School of Medicine. He was also recently listed in *The Best Doctors in America*. Dr. Klatsky received his bachelor, graduate, and medical degrees from the University of Maryland. He completed an internship and residency in general surgery at Sinai Hospital in Baltimore, and a residency in plastic surgery at Columbia Presbyterian Medical Center, Presbyterian Hospital in New York. Dr. Klatsky served as a captain in the United States Army Reserve Medical Corps in Texas, and as clinical clerk, Open Heart Surgery, at Walter Reed Army Hospital in Bethesda. He has appointments at many local hospitals and is chief of plastic surgery at Baltimore County General Hospital. Dr. Klatsky is a member of the Baltimore County Medical Association and many other professional societies.

NEIL B. ROSENSHEIN, M.D. has been named director of the newly established Women's Cancer Center at the Johns Hopkins School of Medicine, Department of Gynecology and Obstetrics. A nationally recognized specialist in the treatment of ovarian, cervical, and uterine cancers, he is also currently an associate professor of gynecology and obstetrics, oncology, and epidemiology at the Johns Hopkins University School of Medicine. Dr. Rosenshein received his bachelor degree in chemistry from the University of Florida, and his medical degree from the University of Florida Medical School. He served his internship and residency in gynecology and obstetrics at the Johns Hopkins Hospital. Dr. Rosenshein was a captain in the United States Air Force at Andrews Air Force Base. He is a member of numerous professional organizations including the Baltimore City Medical Society.

SIDNEY SHANKMAN, M.D. was honored as one of the 100 "Real Heros" by the Maxwell House Coffee Company. Founder and executive director of Second Genesis, Inc., he was selected from thousands of nominations in a nationwide search. Dr. Shankman was honored for his heroic efforts in helping save the lives of hundreds of young people and helping to restructure the shattered lives of many hundreds of others. Dr. Shankman is consultant to the White House for National Drug Abuse Policy and also counsels various foreign governments on drug abuse matters. Dr. Shankman received his bachelor degree from the Columbia College, Columbia University, and his medical degree from the University of Tennessee. He also did both undergraduate and postgraduate work at Harvard University. Dr. Shankman, a leading authority on behavioral disorders, has presented before many legal and political groups including international delegations. He is a member of many professional organizations. ■

In Memoriam

Stephen Mackowiak, M.D.

STEPHEN MACKOWIAK, M.D., 81, died February 20 in Guelph, Ontario, Canada, from complications of Parkinson's disease. He was a general practitioner, an army veteran of World War II, and past president of the Maryland Academy of Family Physicians. Born in Baltimore, Dr. Mackowiak graduated from City College, the University of Maryland Pharmacy School, and the University of Maryland School of Medicine. He served his internship and residency at the Emergency Hospital in Washington, DC. Dr. Mackowiak attained the rank of captain and earned a Purple Heart while serving in the Army Medical Corps. He had a practice in the Dundalk, Maryland area for nearly 40 years, was a member of the Baltimore City Medical Society, and a member of the staff of South Baltimore General Hospital.

Ira Weiss Pearlman, M.D.

IRA WEISS PEARLMAN, M.D., a psychiatrist and former pediatrician, died of prostate cancer on January 22 at the age of 71. A native of Washington, DC, Dr. Pearlman was a graduate of George Washington University Medical School. He completed an internship at Gallinger Hospital and residencies in internal medicine, pediatrics, adult psychiatry, and child psychiatry at Suburban, DC General, George Washington, and Children's hospitals. He was a navy veteran of the Korean War. Dr. Pearlman had had a practice in Bethesda since 1954, had been a psychiatrist at the DC government's Family and Child Therapy Clinic for two decades, and had served on the staffs of many local hospitals. He was also on the clinical teaching staff of Georgetown University's medical school. He was a member of the Montgomery County Medical Society.

Jesse L. Wilkins, M.D.

JESSE L. WILKINS, M.D. died Januray 25 at the age of 75. A practicing surgeon in Annapolis from 1951 to 1980, he served as chief of surgery at Anne Arundel Medical Center where he helped establish a formal department of surgery. Born in Rehobeth, Deleware, and raised in Pocomoke City, Dr. Wilkins was a graduate of the University of Maryland and its medical school. He completed an internship at Doctors Hospital in Washington, DC, and then served in the Army Medical Corps during World War II. After the war, Dr. Wilkins completed surgicial residencies at Mercy Hospital in Baltimore and at Veterans Hospital in Huntington, West Virginia. He was a member of the Anne Arundel Medical Society. He also belonged to the Naval Academy Officers Club, Annapolis Rotary Club, Annapolis Yacht Club, Annapolitan Club, and the Military Order of World Wars.

No information was available at press time for the following members:

Jose Ardaiz, M.D. (Baltimore County), February 6, 1993
Ralph W. Ballin, M.D. (Allegany), February 23, 1993
Charles M. Henderson, M.D. (Baltimore), January 28, 1992
Anthony A. Lewandowski, M.D. (Baltimore County), February 21, 1993
M. Elliott Randolph, M.D. (Baltimore), February 16, 1992
Ralph A. Reiter, M.D. (Allegany), February 8, 1993
Benedict Skitarelic, M.D. (Allegany), December 11, 1992
Alfred J. Suraci, M.D. (Prince George's), February 4, 1993 ■

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872 or 1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements for physician placements in the classified advertisements are charged at the regular classified advertising rate.

Auxiliary

Washington County Auxiliary addresses breast cancer

Brenda Rosenthal, an auxilian who had a personal experience with breast cancer, formed a local affiliate of Y-ME, a national breast cancer organization. With help from the Washington County Medical Society and Auxiliary, the local newspaper, and other community organizations, Y-ME of the Cumberland Valley raised $32,000 to support a project to provide free mammograms for women, a support group for women with breast cancer, and other community projects to promote early detection through breast self-examination and mammograms.

My mother, of blessed memory, always said, "When you get lemons, you make lemonade." In October 1988, I received a bushel of lemons in the form of breast cancer. Like 90% of women, I found the cancer myself, and like at least 75% of women, I did not fit into the normal risk factors category.

During our annual vacation to Hilton Head, I found a lump in my breast. It did not show up on a mammogram and was unable to be aspirated (a test that would indicate a cyst). The physician, however, told me not to worry, so when we returned to Hagerstown I tried not to think about the lump. But my husband, a physician, thought it should be looked at again by a surgeon who is our physician and friend.

Certain events in one's life stand out and are never forgotten. When you ask people where they were when President Kennedy was assassinated, they will tell you in detail where they were. Breast cancer has the same effect on women when they receive the diagnosis. On October 6, 1988, at 4:00 p.m., a very kind, compassionate physician and friend told me I would have a biopsy the next day and to cancel the seminars that were scheduled for the next week. Two years before, I had started a medical management company, Health Claims Services, to provide information, seminars, and management help to physicians and staff to keep up with the changing requirements of Medicare and other insurances. I was in the midst of giving a series of seminars in Hagerstown, Bethesda, Rockville, Cumberland, and Silver Spring when I had the lump examined.

The following weeks are a blur, but it did not look very promising that I would be ringing in the year 1990. The cancer had spread to all of the nodes, and subsequent studies on the tumor indicated an extremely poor prognosis. After the mastectomy and during a course of intensive chemotherapy and radiation, I spent hours weeping. After months of doing this, my husband reminded me of my mother's saying. He asked me when I would take the lemons and start making lemonade.

I enjoy organizing activities, and learned that breast cancer was increasing at an alarming rate and that there was a national breast cancer organization located in Chicago called Y-ME. Thus, I met with a group of interested women to form an affiliate of Y-ME in this area. The mission of Y-ME of the Cumberland Valley is to get the entire tri-state area involved in an early detection and awareness program. A medical advisory board was formed— several surgeons, radiologists, oncologists, and family doctors were helpful in giving suggestions as to the best direction for Y-ME. I became president of Y-ME, and a group of us started involving the entire community in breast cancer awareness projects.

The project is going on its fourth year. In 1992, the Washington County Medical Auxiliary and Y-ME joined forces to make the community aware that physicians and their spouses believe early detection and increased awareness are keys to long-term survival. My being president of Y-ME at its beginnings was a win-win situation for everyone. As a physician's wife, I understand how physicians react to breast cancer, and having lived in the community for 20 years, it was natural to get the entire community involved. As a member of the medical auxiliary, I was aware of how concerned auxilians were about breast cancer. So when the state auxiliary made breast cancer a 1992 project, all the pieces came together.

Thanks to the *Herald-Mail*, the newspaper that serves 42,000 in the tri-state area, over 20 full-page ads listed all Y-ME activities. In October—Breast Cancer Awareness Month—the newspaper ran a full-page ad with signatures of breast cancer survivors, some of whom were only days and others decades from diagnosis. The page made everyone aware that breast cancer does not have to be kept in the closet— that it is only by talking that progress can be made.

Activities were planned for each week in October. A party was held for survivors at which a physician spoke about options after breast cancer diagnosis. The following week, a community seminar was held, "Friends and Family Coping With Breast Cancer," at which Mary Strauss, past president of the Auxiliary to the Medical and Chirurgical Faculty of Maryland and the Auxiliary to the American Medical Association, introduced and set the climate for free-flowing discussion with a physician from Johns Hopkins. Over 70 participants enjoyed a light supper and an informative evening. The third week of October, 99.9% of the physicians in Washington County signed a letter

encouraging all women to perform breast self-examination. This was important because studies have shown that women do not have mammograms because they say their physicians do not suggest it. In this way, we hoped all women would become aware that physicians **do** encourage mammograms.

Every project conducted by Y-ME is done at no cost. It is the belief of Y-ME members that everything we do should be free and open to everyone, no matter what their income level. In addition, Y-ME has an ongoing project with the radiology department at Washington County Hospital to provide free mammograms for income-eligible women. Y-ME pays the hospital a reduced rate, and, to date, over 250 women have taken advantage of the program. Findings of a study in Hagerstown, organized by the Johns Hopkins School of Public Health in Hagerstown, will be published in the near future.

It takes money to organize and implement the many programs of Y-ME of the Cumberland Valley, including a support group for women with breast cancer and a hot line. Each year, Y-ME raises funds by having a Breast Cancer Awareness Month Aerobathon. This past year the goal was $30,000, a very difficult goal to reach in today's economic climate. The Washington County Medical Society and Auxiliary participated and sponsored a team in the "1992 Can-Do Aerobathon," which raised $32,000 (**Figure 1**). Y-ME is proud that physicians, their spouses, and the Washington County Hospital joined forces to push the 1992 goal over the top. This means Y-ME can continue its efforts to encourage all women to practice breast self-examination and to have annual mammograms.

Figure 1. For Breast Cancer Awareness Month, the Washington County Medical Auxiliary Team participated in the Aerobathon sponsored by Y-ME of the Cumberland Valley on October 30, 1992, at Hagerstown Junior College. From left to right are Linda Gray-Jones, Brenda Rosenthal, Agnes Supernavage, and Kim Gabaldoni.

What has been done in Washington County is not unique. Any auxiliary willing to get involved in a project such as Y-ME can achieve the same level of success. In Washington County, planning has already begun for this year's Y-ME activities to reach an even higher goal.

MRS. JOEL ROSENTHAL (BRENDA)
Hagerstown, Maryland ■

Auxiliary presents Poole with certificate of appreciation

During the Auxiliary's Day in Annapolis (January 21, 1993), Med Chi's Auxiliary presented Delegate D. Bruce Poole of Washington County with a certificate of appreciation for his work on H.B. 1227 ('92) (**Figure 2**). This bill, which was initiated by a petition signed by more than 150 physicians, created a moratorium on the hazardous waste cement kilns in Washington County. ■

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

AMA launches new ad campaign on health system reform

The American Medical Association has launched a series of 13 ads in the Washington, D.C. print media. Its purpose: to position the AMA and its Health Access America reform proposal as a comprehensive plan to contain costs, improve access and maintain quality. The ads portray the AMA as working toward serious reform to bring health insurance access to all Americans.

The campaign began with a full-page ad in the Jan. 20 inaugural edition of the *Washington Post.* That ad set the tone for the campaign by suggesting a "Time for a New Partnership" among physicians, the new administration and a new Congress. The ad series will present the AMA's reform agenda to its key Washington audience in a clear, direct, honest way -- inviting partnership and negotiation.

Each ad offers a copy of the AMA's Health Access America proposal. Eleven issue-focused ads also offer readers a fact sheet on the issue addressed in that ad. The final ad will summarize the AMA's agenda and call again for partnership.

The ads are running approximately once a week until mid-April, except when Congress is not in session. Beginning with the second ad, placement is opposite the federal page in the *Washington Post.* The entire series is also appearing in the *Washington Post's* national weekly edition, read by opinion leaders nationally. In addition, the first ad ran in the new Congress issues of *Roll Call* and *Congressional Quarterly,* and in *Roll Call's* special edition on health care policy.

Bush signs changes in CLIA regulations

In his final week in office, President Bush gave his approval to a new waived category for physician-performed tests under the Clinical Laboratory Improvement Amendments. The AMA and a coalition of medical specialty societies had urged the President to authorize the new regulations, which also had been backed by outgoing HHS Secretary Louis Sullivan, MD.

The AMA already has stated its intent to work with the Clinton Administration to develop additional improvements to CLIA, but also stated that the changes represented a significant first step toward improving the measure.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

AMA offers coverage to students, residents

Medical students and residents can now participate in a comprehensive insurance program through the AMA Insurance Agency Inc. The new MedPlus Advantage program offers three policies: life insurance up to $50,000; portable disability income of up to $2,500 per month, which students can carry from medical school to residency; and $2 million comprehensive major medical coverage for students and their dependents. Optional maternity coverage is also available.

To be sure the program met students' needs, MedPlus got input from AMA student members on what they wanted in a benefit plan. MedPlus recognizes the special insurance risks of students and residents; it even offers a rider covering up to $100,000 of educational debt if a student becomes totally and permanently disabled.

Acceptance in MedPlus is guaranteed to all enrolled students, regardless of their health status, and is available on a group basis through participating schools. AMA Insurance Agency Inc. is a wholly owned subsidiary of AMA, providing insurance for physicians and medical students and their families.

Now available: AMA Guidelines for Adolescent Preventive Services

Adolescence is a time of great change. It is the time we expect our children to grow -- physically and emotionally -- into adults. With this tremendous growth often comes a rapid increase in behaviors that put an adolescent's health at risk. Unsafe sexual behavior or experimentation with drugs are just two ways teens may expose themselves to health risks.

In the past, health issues facing adolescents have been dealt with piecemeal. However, ensuring a healthy transition into adulthood requires that these issues be viewed as a whole, with traditional physical and psychosocial development and contemporary health problems addressed together.

To help primary care providers do this, the AMA has just developed *Guidelines for Adolescent Preventive Services* (GAPS) -- a set of recommendations for delivering a *package* of adolescent clinical preventive services.

You can request a copy of the GAPS guidelines by calling the AMA Department of Adolescent Health at 800 AMA-3211, ext. 5570.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

MARCH, 1993
Tips for Vaccine Administration

Because of the increasing number of recommended vaccines, the Epidemiology and Disease Control Program compiled the following information to assist health care providers with vaccine administration, management, and handling techniques. Although the individual package inserts, ACIP statements, and Red Book of the AAP contain more detailed information, these tables were designed to simplify the immunization process and answer some commonly asked questions. Table 1 contains helpful suggestions for giving intramuscular (IM), subcutaneous (SC), intradermal (ID), and oral vaccines. Following a schedule where immunizations are given simultaneously instead of spreading immunizations out over several visits can lessen barriers that affect parents (transportation, cost of additional office visits, time off from work) and will improve immunization rates. Table 2 provides an order of administration which is helpful when giving multiple vaccines to one patient. Table 3 outlines basic vaccine storage and handling techniques essential to any vaccine management program. The figures show appropriate administration sites.

Table 1. **Recommendations for vaccinations by route of administration**

	IM	SC	ID	Oral
Vaccine(s)*	DTP, DTaP, DT, Td, Tetanus(adsorbed), Hib, Influenza, HBV, Rabies, Pneumococcal	MMR, eIPV, Pneumococcal	PPD Mantoux, Rabies(pre-exposure), Typhoid fever (injectable)	OPV Oral typhoid fever
Sites	Arm: deltoid muscle Leg: vastus lateralis	Outer aspect of upper arm or fatty area of anterior lateral aspect of thigh	Inner forearm	By mouth
Insertion angle	90° (perpendicular)	45°	5° to 15°	
Needle size	1", 22 or 23 gauge; ⅝", 25 gauge may be used if long enough to reach the substance of the muscle in infants	⅝", 25 gauge	½" or ⅝", 25 or 27 gauge	

* Abbreviations: Diphtheria-pediatric (D), Tetanus (T), Pertussis (P), Acellular Pertussis (aP), diphtheria-adult (d), Haemophilus influenzae type b (Hib), Hepatitis B (HBV), Measles Mumps Rubella (MMR), Purified Protein Derivative (PPD), Oral Polio (OPV), Enhanced Inactivated Polio (eIPV)

Table 2. **Order and site of administration when giving multiple vaccines to children**

0 to 14 months		15 months or older	
OPV	oral	OPV	oral
DTP/DT	IM-vastus lateralis	DTP/DTaP/DT	IM-vastus lateralis, or deltoid based on size of muscle
Hib	IM-vastus lateralis of other leg	Hib	IM-vastus lateralis of other leg, or deltoid
HBV	IM-vastus lateralis of same leg as Hib, ≥1" apart; or IM-deltoid if ≥12mo & sufficient muscle mass	HBV	IM-deltoid-if sufficient muscle mass
		MMR	SC-outer upper arm

Table 3. **Tips for vaccine handling and administration**

Oral Polio (OPV)	Maintain continuously in the frozen state Store at -14°C (7°F) or lower	Remove from freezer just before using Rub tube between palms to thaw Squeeze entire tube in child's mouth Push up on child's chin to make sure content is swallowed
DTP/DT/ DTaP/Td	Store at 2°-8°C (35°-46°F) Do not freeze	Shake vial Examine for color, cloudy suspension; should be milky but not clumped Insert needle deep into muscle; may pinch muscle to lift from bone and to increase muscle depth, if necessary
MMR	Store vaccine at 2°-8°C (35°-46°F) Do not freeze Protect from light at all times Store diluent at 15°-30°C (59°-86°F) (room temp.)	Reconstitute just before use Never let it sit, be warmed, or exposed to light Pinch up superficial tissue above muscle to insert into fatty subcutaneous tissue
Hib	Store at 2°-8°C (35°-46°F) Do not freeze	Examine for color, clear suspension before drawing up dose; should be clear, colorless
HBV	Store at 2°-8°C (35°-46°F) Do not freeze	Shake vial vigorously before drawing up dose; should be clear, colorless
eIPV	Store at 2°-8°C (35°-46°F) Do not freeze	Supplied in ampules, pre-filled syringes, and multi-dose vials Refer to package insert for administration instructions Examine for color, clear suspension; should be clear, colorless

Update: Shigella in Day Care Centers

Cases of reported shigellosis increased in Maryland in 1992. Figure 1 shows the number of cases of shigellosis reported to the Maryland Department of Health and Mental Hygiene from 1982 to 1992. A total of 446 cases were reported

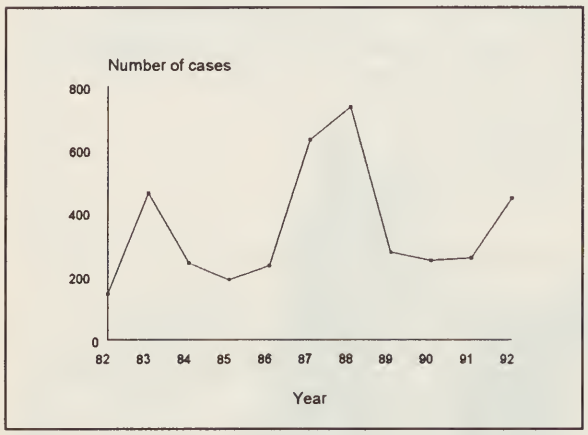

Figure 1. Shigellosis reported in Maryland, 1982-1992

in 1992 (preliminary figures), representing a 73% increase over the 258 cases reported in 1991. Of the 446 cases reported in 1992, 190 (43%) were in children 6 years of age or younger.

Reports of shigellosis outbreaks are also increasing. Between July 1992 and February 28, 1993, nine outbreaks have been reported, all occurring in settings involving the care of young children. Figure 2 portrays the outbreaks reported in Maryland from 1986 to the present with the corresponding number of outbreaks which occurred in child care settings. In 1992, 103 cases of shigellosis were associated with the 7 outbreaks in child care settings (i.e., the patients had diarrhea and/or had a positive culture for *Shigella*); 41 (40%) of these cases had *Shigella* recovered from a stool culture. These figures contrast with 1991 figures, where none of the 3 reported outbreaks occurred in child care settings.

The infection can be asymptomatic or present with watery diarrhea or loose stools which may be mixed with blood and mucus, abdominal cramps, and fever. Antibiotics shorten the duration and severity of illness and the duration of pathogen excretion, and should be used if warranted by the situation. Foodhandlers, child care attendants, and child care or health care workers with shigellosis must be excluded until fecal cultures are negative.

Day care centers are an important setting of transmission of diarrheal diseases, including shigellosis. Not only are children and staff at risk of infection, but parents, siblings, and others in close contact such as playmates, are also at risk. Prevention and control measures in child care settings rely on maintaining high levels of hygienic practices, excluding children with diarrhea, keeping a list of ill children and their symptoms, and educating children and employees involved with child care about handwashing, cleanliness, and infection control.

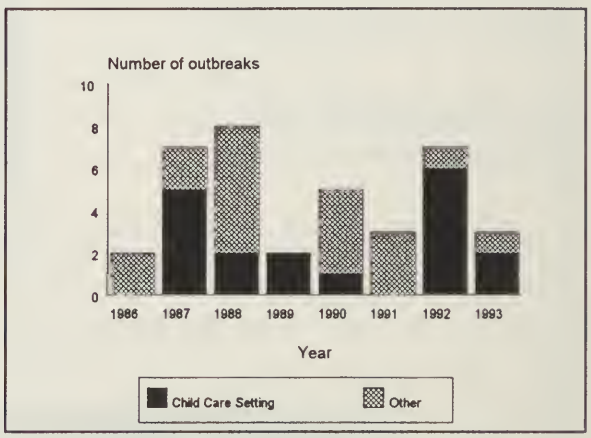

Figure 2. Shigellosis outbreaks reported in Maryland, 1986-1993 (as of February 28, 1993)

Shigellosis cases (suspected or confirmed) and outbreaks are reportable to your local health department. Upon receipt of a report, the health department can assist you and child care facilities in the management of the cases and contacts according to the Maryland communicable disease regulations.

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

University of Maryland

What's the secret?

Practice A submits its Medicare claims electronically. It's quick, efficient, and claims are processed within 14 days.

Compare this to Practice B, which submits its claims on paper. It's cumbersome, time-consuming and claims payment is held by law for 27 days! This means that it could be over a month before the office receives payment.

Electronic Media Claims!

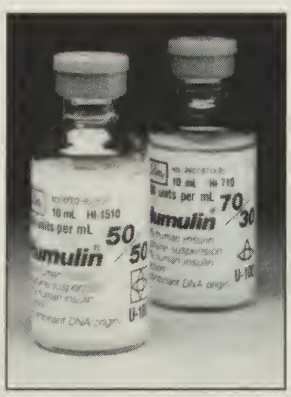
Should you be using Electronic Media Claims?
Consider these advantages:

- ☑ **Payment is quick,** giving you money to use today for other office needs.
- ☑ **Payment is accurate.** You receive next-day verification that your claim was received—and immediate notification of any claim problems. (This is a service that Medicare doesn't offer to paper claim submitters.)
- ☑ **Claim administration is simplified,** because the information Medicare needs is already stored on your office computer.

And, you probably have the technology in place to use this service today!

To find out how you can use your existing system to make collections from Medicare faster and more efficient, call us at:

(410) 561-4277



Our EMC Support Team is ready to help you and your office take advantage of Electronic Media Claims. Call today!

Because One Size Doesn't Fit All...

New Humulin 50/50 is the tailor-made answer to individual patient needs. A unique combination of equal amounts of Regular human insulin and NPH human insulin, it will be useful in situations in which a greater initial insulin response is desirable for greater glycemic control.

Like Humulin 70/30*, new Humulin 50/50 offers the convenience and accuracy of a premix. And it can be used in conjunction with an existing 70/30 regimen.

***New* Humulin® 50/50**

50% human insulin isophane suspension
50% human insulin injection (recombinant DNA origin)

The Newest Option in Insulin Therapy

WARNING: Any change of insulin should be made cautiously and only under medical supervision.

* Humulin® 70/30 (70% human insulin isophane suspension, 30% human insulin injection [recombinant DNA origin]).

DEPARTMENT OF HEALTH AND HUMAN SERVICES SOCIAL SECURITY ADMINISTRATION

MEDICAL OFFICER
CARDIOLOGY

$68,514 - $87,784
(possible eligibility for additional $7,000 - $20,000 Comparability Allowance)

The **Social Security Administration** located in the suburbs of Baltimore, is seeking a physician to provide advice and direction for the development of medical policies and procedures for the Disability Program and the Supplemental Security Income Program for the blind and disabled in the medical discipline of cardiology.

Responsibilities include:

- Functions in leadership capacity within national programs administered by the Social Security Administration.
- Develops and maintains liaison with professional medical community, i.e., professional associations and medical educational institutions.
- Provides advisory and consultative services to the Chief Medical Director, other Medical Officers in Central Office, and to regional and State Agency Medical Officers.
- Plans and directs special projects designed to provide information and data to make medical development and evaluation standards.
- Provides professional and technical guidance to staff and contract physicians.

Subspecialty Board Certification in Cardiology is required.

For information concerning this vacancy, please call:
John H. Mather, M.D. (410) 966-1983 or Edmund Glomski (410) 966-1978

Equal Opportunity Employer

Director of Internal Medicine Residency Program

Prince George's Hospital Center, the 450-bed flagship hospital of Dimensions Health Corporation in Cheverly, Maryland is seeking a physician executive to be a moving force behind our commitment to quality, community and education.

Located in suburban Washington, D.C., the Hospital Center serves a diverse metropolitan community, providing care that includes a Level I Shock Trauma Unit, Comprehensive Cardiology (inclusive of invasive cardiology and open heart surgery), a Level II Neonatal Nursery, and a variety of graduate medical education programs. The Medical Programs consist of 39 Medical Residents and 12 Family Practice Residents.

The successful candidate should be board certified in Internal Medicine with teaching experience, maturity, diplomacy and tact needed to be a member of the Hospital Center's senior staff.

Responsibilities include the administration, expansion and academic improvement of the Medical Residency Program. Compensation is competitive and inclusive of a comprehensive salary and fringe benefit package.

Candidate ideally will have demonstrated a record of administrative leadership and clinical accomplishment. Interested applicants should submit a resume and statement of interest by April 1, 1993 to:

Faranak Sotoudeh, M.D.
Chairman, Department of Internal Medicine
c/o Department of Professional Education
Prince George's Hospital Center
3001 Hospital Drive
Cheverly, MD 20785.

PRINCE GEORGES HOSPITAL CENTER

Every Hour, Every Day.

Every hour, every day, you're out there: healing, helping, working to the limit.

Other people have jobs, or careers, but you have a responsibility that doesn't end at the end of the day — that never really ends.

To prepare for that responsibility, you studied longer, trained harder and sacrificed more than most people could even understand.

And now, to each patient you bring all of those years of training and work. Each time, with each case, you bring all of your intelligence, you bring your desire to help, and you bring the special blend of experience and understanding that your patients rely on.

Few people can understand the pressures you're under — or the thought you carry with you.

As your company — owned by physicians, for physicians in Maryland — all of us at Medical Mutual want you to know that we appreciate what you do. Carefully, quietly, behind the scene, we do our jobs so you can be free, every hour, every day, to do the most important work there is.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

AMA renews call for physician input on health care reform

During the crucial first 100 days of the Clinton Administration, the American Medical Association stepped up its involvement in the health system reform debate. AMA's goal: to ensure that patients' needs remain the focus of system reform.

The AMA organized an unprecedented two-day Washington summit, "A Time for New Partnership," on March 23-25 to encourage dialog between physicians and the Clinton Administration and Congress. Physicians from across the country gathered in Washington to hear Vice President Al Gore speak on health system reform; HHS Secretary Donna Shalala and Majority Leader George J. Mitchell (D, Maine) also addressed the physicians.

After a briefing by AMA legislative staff, the physicians visited with their representatives in Congress.

The AMA is continually working to make the voice of American physicians heard in Washington. As AMA EVP James S. Todd, MD, stated in a letter to White House senior health policy adviser Ira Magaziner, "Bring us into the process, and we can help make it work. Without the 'buy-in' of people in the front lines of health care delivery, enactment and implementation of reform will be much more difficult."

Contest boosts AMA's anti-tobacco crusade

AMA and U.S. Surgeon General Antonia Novello, MD, are sponsoring a nationwide contest to increase children's awareness of the dangers of smoking. AMA President John L. Clowe, MD, said the contest is part of the AMA's and the surgeon general's continued campaign to achieve a smokefree environment by the year 2000.

The contest is designed to combat the tobacco industry's "spending millions of dollars in advertising to encourage young children to start smoking."

AMA and the surgeon general last year sponsored a protest march in Chicago against cigarette advertising that targets children. They also demanded that R.J. Reynolds Co. drop ads featuring the company's most effective marketing tool — the cigarette-smoking Old Joe Camel that appeals to children.

The nationwide contest, called "Say No, Old Joe," is aimed at the Camel cartoon. Studies published in the December 10, 1991 JAMA showed children six years of age and older found the character just as recognizable as the Disney Channel's Mickey Mouse logo. Old Joe Camel's appeal increased smoking of that brand among children from five percent to 32 percent during a three-year period, the studies found.

"The AMA will continue its fight to eliminate underage smoking and put pressure on cigarette manufacturers who use deplorable advertising tactics to entice children to begin smoking," said Lonnie R. Bristow, MD, AMA vice chair. "Maybe Old Joe Camel has taken his last puff?"

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Smokefree workplace rules supported

The AMA urged Secretary of Labor Robert Reich to develop and promulgate standards that provide a smokefree work environment for all employees as soon as possible.

A letter from AMA EVP James S. Todd, MD, states the Association's belief that "this could be accomplished most easily by a total ban on smoking in the workplace." However, the letter said a standard might allow — but not mandate — a fully enclosed, separately ventilated designated smoking area for employees.

Citing an Environmental Protection Agency report released in January on the health hazards imposed by "passive" smoking on nonsmokers, the AMA said it now "is evident that action is needed on behalf of America's labor force." The letter urges that the Occupational Safety and Health Administration separate environmental smoke from other problems of clean indoor air.

AMA testifies before CLIA committee

Physicians must be allowed to perform certain laboratory tests in their offices without undue restrictions, to meet patient care needs and to help contain laboratory costs. J. Edward Hill, MD, of the AMA's Council on Legislation, recently delivered this message to the Clinical Laboratory Improvement Advisory Committee in Atlanta.

Dr. Hill addressed issues related to the physician-performed microscopy category. He stressed that HCFA, CDC, and the committee must share in complying with CLIA, including technical and administrative complications and assuring patient access to medically necessary laboratory services.

He said physicians are overwhelmed by CLIA, OSHA and ADA regulations, which are costly and time-consuming to administer. Many physicians are deciding not to perform laboratory tests in their offices as a result, Dr. Hill added.

AMA applauds new AHCPR guidelines

The AMA commended the Agency of Health Care and Policy Research for introducing its newest clinical practice guidelines on cataract surgery. The new guidelines suggest physicians should postpone surgery and use other measures to improve visual functioning until the cataract becomes too problematic.

"In an era when, more than ever, every medical dollar counts, the continuing development of practice parameters means that medicine and government are prepared to meet the challenges of the era by improving patient care while effectively managing costs," stated AMA EVP James S. Todd, MD. "Working with AHCPR has given us the opportunity to forge a new partnership between medicine and government with the potential to vastly improve patient care."

The AMA, working with other physician organizations, is leading activities to ensure the medical profession maintains control over the development and application of practice parameters that improve patient care and effectively manage costs.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Clarifications

In Dr. Bianco's article, "Consent to treatment, Application to performing arts medicine" (March 1993, Volume 42, Number 3), the third sentence in the section "Consent by spouse" (page 294) mistakenly implies that marriage endows a spouse with the right to co-consent for the other spouse or to veto the other spouse's given consent. The sentence should more appropriately read, "Some physicians and spouses mistakenly believe that marriage inherently endows one spouse with the right to co-consent for the other spouse or even a right to veto the other spouse's given consent."

Also in Dr. Bianco's article, a sentence in the second paragraph might suggest that Dr. Bianco believes that physicians spit on people. The sentence might more appropriately read, "Thus a person would be liable not only for contacts that cause physical harm, but also for those relatively trivial ones that are merely offensive and insulting, such as spitting in another's face, forcibly removing another's hat, or any contact brought about in a rude and insolent manner."

In "Combined dopamine and serotonin agonists: A synergistic approach to alcoholism and other addictive behaviors" (February 1993, Volume 42, No. 2), Dr. Hitzig wishes to clarify that in a study by Olds et al "fenfluramine in massive doses stopped lever pressing totally. The addition of amphetamine ameliorated this effect, but there was still suppression of lever pressing. The conclusions derived from this article are still in effect."

MARYLAND RESIDENTS:
TWO WAYS TO EARN TRIPLE-TAX-FREE INCOME

100% NO LOAD

T. ROWE PRICE MARYLAND TAX-FREE FUNDS—TWO TAX-SAVING STRATEGIES

As a Maryland resident, you could be losing over 37% of your earnings to income taxes. T. Rowe Price, the leader in Maryland tax-free investing, can help. We offer *two* Maryland funds whose earnings are *exempt from federal, state, and local taxes*—the income is *triple-tax-free*, so you keep everything you earn.* And, because tax-free yields are currently attractive versus comparable taxable yields, your income can be higher with tax-free funds, as the chart shows.

Your earnings can be higher with tax-frees

Annual income on an investment of $20,000 if you're in the 31% federal tax bracket, or 37.2% bracket including state and local taxes

	What you earn		What you pay in federal taxes		What you pay in state and local taxes		What you keep
Typical long-term bond fund							
Taxable fund yielding 6.6%	$1,320	–	$409	–	$82	=	**$829**
Tax-free fund yielding 5.1%	$1,020	–	$0	–	$0	=	**$1,020**
Typical short-term bond fund							
Taxable fund yielding 5.0%	$1,000	–	$310	–	$62	=	**$628**
Tax-free fund yielding 3.5%	$700	–	$0	–	$0	=	**$700**

While earnings from typical taxable investments initially appear to be higher, taxes can subtract a lot. With triple-tax-frees, you keep it all.*

Two no-load Funds let you choose your approach.

Whether you want to minimize risk or maximize potential returns, T. Rowe Price has a Fund to suit your needs.

Maryland Short-Term Tax-Free Bond Fund is the *only* no-load Maryland fund to give you the minimal risk of short-term tax-free bonds. With an average portfolio maturity of 1–3 years, it can be appropriate for those who prefer a more cautious investment approach. The Fund offers less risk and lower returns than a longer-term fund.

Maryland Tax-Free Bond Fund—*Maryland's largest tax-free fund*—offers greater income potential, with greater price volatility than our short-term fund. It invests in long-term Maryland securities and has an average portfolio maturity greater than 10 years. Of course, these are both bond funds, so yields and share prices will vary as interest rates change.

Our free report can help you make an informed decision. *The Basics Of Tax-Free Investing* can help you develop a tax-free strategy to meet your investment goals. Each Fund has a $2,500 minimum, offers free checkwriting, and has **no sales charges.**

When Is A Townhouse Not A Townhouse? When It's Built By Gosnell.

RIVER FALLS
Potomac's Family Community.

Almost four years in the planning, River Falls' Town Estates represent a new concept in luxury living. Here, residents can enjoy the elegance, space and comfort of the finest custom homes while enjoying the ultimate luxury of freedom.

These homes are unlike anything you have ever seen before. Starting from the 36 foot widths and attached garages to the NINE foot ceilings on BOTH first and second floors. Add the extensive architectural detailing from the interior three-piece moldings to the exterior molded bricks. And floor plans designed to make living easy and built with pride and quality that goes into every Gosnell home.

Town Estates offer homeowners the best of all worlds. A new standard of convenient living...the secluded natural charm and active community life of River Falls...quick access to fine stores, entertainment, transportation and workplaces ...plus all the space and elegance of a luxury home. If you want to enjoy a new carefree lifestyle without sacrificing comfort and quality, River Falls' Town Estates were designed for you. Come see it now.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities
- Highly regarded public and private schools

A GREAT WAY TO SERVE

Joseph Snyder, M.D. New Med Chi President

Joseph Snyder, M.D. was recently inaugurated as president of the Medical and Chirurgical Faculty of Maryland for 1993-1994.

As president, Dr. Snyder notes that, "reform of the health care system is the number one problem and the number one issue of the year." He adds that he would like to see an increase in physician participation in organized medicine.

A 1962 graduate of Jefferson Medical College, Dr. Snyder completed his internship and an internal medicine residency at Jefferson Medical College Hospital. Following a fellowship at the National Institutes of Health, National Cancer Institute, Dr. Snyder completed a residency in ophthalmology at the George Washington University Medical Center.

Dr. Snyder is actively involved in organized medicine. Past president of the Maryland Academy of Ophthalmology and Montgomery County Medical Society, Dr. Snyder has also served as a member of Med Chi Council, vice-chairperson of the Council, AMA delegate, and president-elect.

Dr. Snyder currently maintains a private practice in Silver Spring and Bowie in ophthalmology. He lives in Silver Spring with his wife Madrian. They have two daughters, Lori and Lee.

Federal Communications Commission Order — Office Telephones

A Federal Communications Commission (FCC) order requires that all telephones in workplaces with 20 or more employees must be hearing-aid compatible by May 1, 1993. Businesses with fewer than 20 employees have until May 1, 1994, to comply.

All telephones manufactured in the United States since August 1989 have been required to be hearing-aid compatible. Phones manufactured before that date must be retrofitted with a new handset in order to comply with the FCC order.

Child Wellness Legislation

Effective with dates of service on and after 10/1/92, House Bill 485 required that certain health insurers provide specified coverage for child wellness services. The law applies to group medical expense policies providing dependent coverage which are delivered or issued for delivery in Maryland on or after October 1, 1992. The law does not apply to a self-insured plan. The child wellness services include

1. All visits for and costs of childhood and adolescent immunizations recommended by the Advisory Committee on Immunization Practices of the Centers for Disease Control and Prevention;
2. One visit for the phenylketonuria (PKU) test between two and four weeks of age;

3. All visits for, and costs of, age-appropriate screening tests for tuberculosis, anemia, lead toxicity, hearing, and vision as determined by the American Academy of Pediatrics;
4. The following services at each of the visits required under items 1, 2 and 3:
    a. a physical examination;
    b. a developmental assessment; and
    c. parental anticipatory guidance; and
5. Laboratory tests considered necessary by the physician as indicated by the services provided under items 1 through 4.

Please check with the child's insurer to determine coverage and how to code for these services.

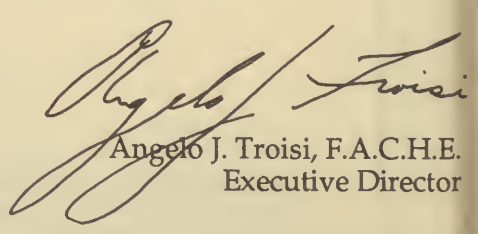
Laboratory HCPCS Codes — Maryland BCBS

The implementation date of the 1993 lab codes has been changed to May 1, 1993, with a grace period through July 31, 1993. Physicians, suppliers, and providers may submit claims for services rendered during this grace period with 1992 and 1993 lab codes. Claims for services provided prior to the grace period must reflect 1992 codes. Claims with dates of service on or after the grace period (after July 31, 1993) must reflect 1993 Health Care Financing Administration (HCFA) Common Procedure Coding System (HCPCS) codes.

Clinical Lab Fee Schedule Codes— PABS

Current clinical diagnostic laboratory codes should be reported until further notice. A 60-day grace period will proceed the effective date during which time both the 1992 and 1993 codes will be accepted.

New Medicare Policy



The most recent medical policy on concurrent care under Medicare follows this Executive Director's Newsletter.

1993 Med Chi Semiannual Meeting

Mark your calandars! The 1993 Med Chi Semiannual Meeting will be held Friday-Sunday, September 10-12, 1993, at the Sheraton Ocean City Resort and Conference Center.

Med Chi has obtained a special group rate of $110.00 per night for a single/double occupancy room* for this meeting. To reserve your room, call the Sheraton at 1-800-638-2100.

*Tax and incidentals not included.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

Medical Policy

SUBJECT: **Concurrent Care**

EFFECTIVE DATE: **4/1/93**

CPT/HCPCS Code(s): **99221 - 99223, 99231 - 99233, 99238**

Description of Service: Concurrent care occurs when more than one physician is involved in the regular care of the patient. The role of each physician must be clearly defined to determine correct coverage and if the issue is not clear, clarification will be developed.

Clinical Indications: Coverage can be allowed if the services provided by each physician are established as reasonable and necessary as the result of an active concurrent role in the patient's treatment. This requirement can also be fulfilled if the patient's condition warrants the services of more than one physician on an attending rather than a consulting basis and all are determined to be reasonable and necessary. In making this determination, the specialty of each physician will be considered since the presence of multiple medical condition may require diverse medical or surgical services (e.g., renal failure and G.I. bleeding; respiratory failure in a post-colectomy patient). Care performed by physicians in different specialties or in different subspecialties of the same specialty is generally considered reasonable and necessary (e.g., surgeon and internist or cardiologist and nephrologist, respectively). The need for care of more than one physician in the same specialty will be carefully considered, but can be justified only if medical necessity is established (e.g., PTCA provided by an interventional cardiologist, and the on-going care of the coronary artery disease and acute M.I. by a non-invasive cardiologist).

If it is determined that the service of one or more of the physicians is not warranted, payment may be made only for the attending physician's services. If concurrent services are allowed, frequency and duration will also be considered and must be reasonable for the special circumstances that require additional care. The level of involvement by each physician may also differ and will be reviewed for appropriateness and necessity.

Billing Instructions:

A physician service must be provided and documented for reimbursement purposes. Charges for more than one visit a day will be denied unless justification is presented for medical necessity (e.g., sudden, acute condition; deteriorating medical condition; emergency situation, etc.). Only one initial comprehensive exam will be allowed for the attending and/or the consulting physician per hospital admission. A regular subsequent hospital visit will not be reimbursed in addition to the hospital discharge service (CPT 99238). The levels of care chosen must meet medical necessity and be appropriate for the content of the service provided which primarily includes the extent of history obtained, the physical exam, and the complexity of medical decision making required (key components).

"People who care for people who need care"

LETTERS TO THE EDITOR

Quinacrine no longer available for giardiasis treatment

The paper by Malloy et al regarding giardiasis[1] was quite interesting, but requires an update as to therapy. Quinacrine (mepacrine, Atabrine) is no longer available in North America or in England or France to my knowledge. The manufacturer, Winthrop-Sanofi, lost its bulk supplier and has been unable to obtain another source that is acceptable to the US Food and Drug Administration (FDA).

Rheumatologists learned of this fairly quickly when lupus patients were unable to obtain the medication. I have called government agencies and foreign sources without resolving the problem. The FDA is willing to allow importation for personal use if one can find a foreign supplier. I am aware of the availability of chemical grade mepacrine and know that a few people are using that.

The use of a nonpharmaceutical grade of mepacrine is worrisome in light of the outbreak of eosinophilia myalgia syndrome. The latter has been shown to be due to a minor change in the manufacturing process, with formation of a different contaminant that seems responsible for the syndrome. That experience would lead me away from the use of anything but a well-tested pharmaceutical grade product.

Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:

- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

Joseph Snyder, M.D.: 1993-1994 Med Chi president

Vivian Smith

Ms. Smith is director of public relations, Medical and Chirurgical Faculty of Maryland, Baltimore, Maryland.

Change is the buzzword in health care all over America. With President Clinton in the Oval Office, and Hillary Rodham Clinton in charge of reforming the American health care system, state medical society leaders have a great challenge—to assist in bringing their state into the forefront of health care reform, while keeping the needs of physicians and patients in focus.

On Saturday, May 1, 1993, Joseph Snyder, M.D. will become the 146th president of the Medical and Chirurgical Faculty of Maryland, and he is fully aware of the challenge he faces: "Reform of the health care system is the number one problem and the number one issue this year."

Figure 1. Dr. Snyder, an ophthalmologist in Montgomery and Prince George's counties, with his wife, Madrian.

Health care reform

Dr. Snyder does not think most patients want to eliminate the present system in favor of an unknown. He is opposed to a national health insurance program based on a one-payer system, or a system financed by the government. "I just don't think that it will work from a physician or patient standpoint," he says. He is confident that this is not what President Clinton is pushing. "I think that his message to Congress was that patients will have the freedom of choice. That impressed me."

Dr. Snyder does, however, find a major problem with the present reform movement–lack of physician input. "I don't think that any kind of system is going to work without the doctors being involved. There has to be practical medical input from physicians because we are the ones who deal with patients; we are the ones who know what will work and what won't work. Our input is critical to any workable solution," he asserts.

The American Medical Association (AMA) has been in the forefront of health care reform for the past several years with programs such as Health Access America, reminds Dr. Snyder. "The AMA has been up-front with the need for health care reform, so those who say that doctors are not interested in health care reform

are wrong. We have been deeply involved with it and are willing to assist in ways that are good for our patients."

Dr. Snyder thinks everyone, physicians and patients alike, are curious and nervous about how things will develop. While admitting there is no easy answer, he would like to see insurance reform, elimination of pre-existing illness clauses in various insurance policies, a return to a community-based rating system, and insurance coverage for all employed people, including the transfer of insurance for people who change jobs.

Dr. Snyder goes further to say that he does not believe everyone needs to be covered in the same fashion, by one insurance system, without the freedom of choice. "Speaking as a patient and not as a physician, I would not be happy if someone came along and said I must use XYZ insurance company."

The uninsured and Health Access America

While admitting that no plan is perfect, Dr. Snyder believes the AMA Health Access America plan addresses the issues of the uninsured and underinsured. The AMA has been deeply involved and is willing to negotiate a plan to benefit all patients, stresses Dr. Snyder. He believes that everyone who works should be covered by his or her employer, and that people who are unemployed, chronically ill, or disabled need to be helped by the government with the cooperation of the medical community.

Government regulation and cost containment

Dr. Snyder believes that "once government gets involved, all the paperwork stifles physicians." Physicians need to be able to practice medicine without bureaucracy, stresses Dr. Snyder. He thinks there has to be a balance, adding, "One cannot go for cost containment alone and improve quality." Physicians need to be involved in issues concerning the quality of health care so that quality is not lost in trying to save money. He fears that the practice of medicine becomes more impersonal with government interference. He is also concerned that the present managed care situation (health maintenance organizations) sometimes forces patients to change physicians from year to year. "This doesn't bode well for having a good physician-patient relationship."

Human immunodeficiency virus

Every year, measures are introduced into the legislature on human immunodeficiency virus (HIV). It is a topic physicians must continuously follow. Problems that have developed in emergency situations lead Dr. Snyder to believe it is important for testing to be allowed without consent when a patient is unconscious or otherwise incapable of consent. It should not make that much of a difference, he adds, because physicians should follow universal precautions under all circumstances.

Self-referral

Med Chi physicians have had many discussions about the self-referral issue. Dr. Snyder agrees with the solutions proposed by the Ad Hoc Committee on Self-Referral, the major point being that legislation is not an appropriate way to solve this issue. He does not find it inherently unethical for physicians to have laboratories in their offices as long as they use them appropriately. Doing away with this option will cause tremendous inconvenience to patients, adds Dr. Snyder. He does, however, think patients need to know up-front that the facilities they are being referred to are owned by their physician.

Smoking

A strong supporter of the anti-tobacco movement, Dr. Snyder has taken an active role in the Med Chi anti-smoking campaign. A longtime advocate of the two dollar a pack cigarette tax, he is glad to see it is beginning to gain momentum in the legislature.

Figure 2. L to R: Lori, the Snyders' older daughter, is in medical school at Dr. Snyder's alma mater. Lee attends the Wharton School of Business at the University of Pennsylvania.

Figure 3: Mrs. Snyder, the state auxiliary vice president, poses with Dr. Snyder outside their home.

He believes this tax will raise revenues and discourage people from smoking.

Membership

Dr. Snyder thinks there are too many Med Chi physicians who are not AMA members. He does not believe they realize or understand what the benefits of AMA membership are. There has been a major change in the AMA over the past several years, and it is "in the best interest of every physician to unite and join the AMA," notes Dr. Snyder.

As for Med Chi membership, Dr. Snyder intends to continue Dr. Yosuico's efforts to increase membership. "We need to find out from the components how many practicing physicians are not members and deal with them the same way as the AMA, by having every member recruit a member," says Dr. Snyder.

Med Chi goals

Dr. Snyder would like to see the present strides in legislative efforts intensified. He thinks that Med Chi strength comes from its diverse membership and sees the recent reorganization as a factor, referring specifically to the increased size of the Executive Committee. Med Chi will only continue to be strong by obtaining input from its members and changing with the times, he adds.

He does, however, think that the lack of unity among Med Chi members has been a problem and aspires to see this resolved. Once decisions are made by the Council and the House of Delegates, he stresses, members need to stand united, speak with one voice in public, and put differences aside. Dr. Snyder hopes that the dialogue between component and specialty societies and Med Chi leadership can increase.

Speaking with enthusiasm about the reorganization at Med Chi, Dr. Snyder commends the efforts of the Med Chi staff, stating that "growth and change are always needed to ensure that Med Chi can continue to provide quality services to its members."

Future of medicine

Medicine will see some significant changes over the next 10 years, declares Dr. Snyder. But he does not believe the changes will be radical; they will come by way of insurance reform and changes in the delivery of medical care. Dr. Snyder strongly believes that states need to be given the opportunity to do things within their own communities to see what works and what does not. He believes that nothing significant will happen in Maryland without Med Chi involvement. Dr. Snyder thinks Med Chi will continue to have a strong relationship with the executive and legislative branches of government and will be able to provide the information necessary for legislators to make informed decisions. "I see Med Chi as extremely important in any changes that take place."

Personal background

The early years. Dr. Snyder wanted to become a physician as early as tenth grade. Always interested in science, he thought medicine seemed like an interesting and gratifying profession. A Phi Beta Kappa, he received his B.A. from the University of Pennsylvania with honors in zoology.

Medical school, internship, and residency years. Dr. Snyder attended Jefferson Medical College where he completed his internship and first year of residency in internal medicine. "From the first day of medical school, I really felt that I was doing something that I enjoyed." He graduated at the top of his class. His talent is evidenced by his Anatomy Prize, Hoffman LaRoche Award, Surgery Prize, and Hobart Hare Honorary Medical Society designations on his curriculum vitae. In addition, he was elected to the Alpha Omega Alpha Honor Society.

He became involved in research with one of his professors while at Jefferson, which led him to the National Institutes of Health (NIH). "NIH was very exciting. We were doing the first combined chemotherapy for leukemia, and we were starting to

get some good results with patients going into long-term remissions. We were on the edge of really exciting things." While at NIH, Dr. Snyder began working with one of the ophthalmologists at the eye institute. Realizing he enjoyed ophthalmology, but having no formal training in it, he applied for a residency at George Washington University Hospital and was accepted.

Dr. Snyder finds ophthalmology to be "a fascinating field because it combines medicine, surgery, and neurology. It is satisfying because we can help most of our patients. It's a happy specialty."

Organized medicine. Many of Dr. Snyder's medical contributions have been in organized medicine. He first became interested in organized medicine in the 1970s. A member and later, president, of the Maryland Academy of Ophthalmology, he also served as chairperson of its legislative committee, and founded the academy's Political Action Committee (PAC). He was deeply involved with the Maryland legislature, primarily on ophthalmology issues. This led to his becoming actively involved in the Montgomery County Medical Society for which he also served as president. Dr. Snyder became a member of the Med Chi Council in the early 1980s and served as vice chairperson in 1985. When he became an AMA delegate in 1986, he got to see what the state of medicine as a whole was like. On a national basis, he found organized medicine very interesting.

Family life. Dr. Snyder has long been an active supporter of the auxiliary. His wife, Madrian, is a past president of the Auxiliary to Montgomery County Medical Society and has held many state auxiliary offices. Currently, she is first vice president.

Dr. and Mrs. Snyder enjoy traveling to different parts of the state and meeting new people. In addition, they regularly attend the theater and the National Symphony Orchestra. Dr. Snyder admits, "I like to play golf when I find the time, which isn't too often. I just enjoy getting away from the telephone for a while."

Seeing his two daughters through their college experiences is included in his personal goals. His older daughter, Lori, is a second-year medical student at Jefferson Medical College. Following in her father's footsteps, she is committed to organized medicine. She is president of the Jefferson Chapter of the Medical Student Section of the AMA. The AMA has recognized Lori with a plaque for outstanding membership recruitment. His younger daughter, Lee, is a second-year student at the Wharton School of Business at the University of Pennsylvania. She is the founding member of the Physicians' Children Volunteer Corps, which has the dual purpose of presenting a positive image of the medical family and assisting the community through volunteer efforts. Dr. Snyder notes that Lee may be interested in attending medical school, also. ■

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

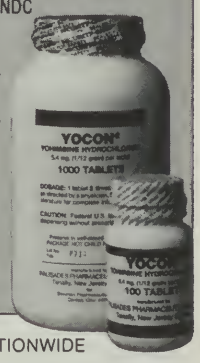
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

A memorial to Joseph J. Harrison III

DeWitt E. DeLawter, M.D.; Constance Townsend; and Joseph Harrison IV

Dr. DeLawter is a diabetologist and an internist from Bethesda, Maryland. Ms. Townsend was assistant to the executive director under Jack Sargeant. Mr. Harrison is Joe Harrison's oldest son.

Figure 1. Joe Harrison

Joseph John Harrison III died suddenly on January 16, 1993, at the age of 63. There are no words to express the sadness this untimely passing brought to the members of the Medical and Chirurgical Faculty of Maryland, his family, and his friends. Joe was the associate executive director and comptroller at Med Chi, and had worked at Med Chi for nearly 30 years.

Joe was born in Baltimore, graduated from Polytechnic High School, and served for four years in the US Navy (1950-1954) as an aviation electronics technician. He attended the McCoy College of Business at the Johns Hopkins University, graduating in 1960. He became a certified public accountant in 1970.

He met his future wife, Marie Rowles, at the Cahill Recreation Center in Baltimore in February 1950; they were married in August 1952 during his naval assignment at Norfolk, Virginia. Joe and Marie had a wonderful marriage and were blessed with five children: Teresa Malinsky is a children's reading specialist who lives in Michigan, Joseph IV is a computer scientist at the Johns Hopkins Applied Physics Lab, Joan McDade is a nurse at Sinai Hospital, Thomas is a line technician for the Baltimore Gas and Electric Company, and Mary is a linguist--specializing in Japanese--currently on the faculty of the Keio University in Japan. Joe and Marie have also been blessed with six grandchildren.

"You are honestly the best father I've ever seen . . . . I can't believe how I've been blessed." Mary Harrison, Joe's youngest daughter, in a letter she wrote when she started college.

January 25, 1993

Dear Mrs. Harrison:

We wish to express our deepest sympathy at the sudden loss of your husband.

Joe Harrison will be truly missed by the medical profession of Maryland. He was respected and appreciated by innumerable physicians with whom he was associated during his distinguished career with the Medical and Chirurgical Faculty of Maryland. His effective management of the finances of the Faculty serves as a model of integrity and indeed contributed to the Faculty's efforts toward upholding the highest standards of medical care for the citizens of Maryland.

All of us here at the American Medical Association offer our heartfelt sympathy and we hope that the precious memories you have of Joe will sustain you and bring you strength and peace.

Sincerely,

James S. Todd, MD
Executive Vice President, American Medical Association

Joe's many accomplishments include his professional affiliations and volunteer activities. He served on the Board of Directors of the Med Chi Insurance Fund and was instrumental in the development of legislation enabling the creation of the Med Chi Agency, for which he served as secretary and treasurer. He was active in, and served as the treasurer of, the Maryland (MMPAC) Political Action Committee from its inception. He served as fund-raiser and treasurer of the Maryland Eye Bank for ten years. A member of the American Institute of Certified Public Accountants, the American Society of Association Executives, the Maryland Society of Association

Mrs. Marie Harrison. Joan McDade (her husband Jim is missing). Joe. Mike Malinsky, Terry's husband. Bottom row: Laura, Tom's and Suzanne's oldest daughter. Joe's parents. Terry Malinsky, with two of her and Mike's children, Rachel and Jonathan (Matthew, their youngest child is missing).

Figure 3: Joe Harrison with his wife, Marie. *(Picture used with permission of Olan Mills.)*

Figure 4: Joe relaxing for a few minutes in his Med Chi office.

Executives, and the Professional Insurance Agents Association, he also found time to volunteer his services on committees of several local churches and served as vestryman and treasurer of St. Timothy's Episcopal Church in Catonsville, Maryland.

"He was a considerate and caring man . . . . His laugh was a good laugh and will be missed." His secretary Karen, whom he called Shirley.

Those whose paths met with Joe's, liked his vivacious personality, warmth, and the integrity and competence that he exuded. Staff who worked directly with Joe will remember him as easy-going, never giving direct orders, but always obtaining results through loyalty and respect. He helped when help was needed, coached when coaching was necessary, and counseled when counseling was required.

Physicians who entrusted Joe with their dues always felt a sense of security, knowing that he would handle and protect their money as if it were his own. He actively managed Med Chi funds to make the most from the investments, and increased Med Chi wealth over his years of stewardship.

Joe's commitment to saving money for Med Chi extended to a personal level. It was not unusual to spot him coming to the office in work clothes, with tools under his arm, to repair some plumbing or air conditioning problem. He personally oversaw many of the details of the expansion into the new building, down to insuring that the marble tiles were of top quality. He took paperwork home with him every night, often more than would fit into a briefcase, using a box instead. His staff fondly called him the "box man."

"At five o'clock we would all go home.... I really don't know what time he left to head home each day." Karen Buckmaster, Joe's secretary

Outside of work, Joe enjoyed participating in sports activities, including volleyball and especially tennis. Although he did not start playing tennis until he was in his forties, Joe became an

accomplished player, winning several tournaments and prizes. At home, Joe always welcomed friends and guests with his big warm smile, and was happy to have people stay as long as they liked. Even when daughter Mary brought home visitors from Japan, who did not speak English very well, Joe soon put them at ease and helped them in every way. Joe and Marie hosted a twice-monthly Bible study, and his insights were always sought and respected.

Joe will be sorely missed at Med Chi, for he was a major source of large and small bits of information about the building, the property within it, and the activities of the Faculty. Much of this information was contained in his office, in the many piles of papers and cartons saved there. Joe always told his staff not to disturb it, that "it's all good stuff"; he could always locate any particular information that was needed.

The sympathy and love of Med Chi members and staff are extended to his wife, Marie, and all his family and friends. Our prayers are for them and with them." ■

Breast cancer: A common concern for patients and physicians

Robert E. Martin, M.D.

Dr. Martin is a general surgeon in Baltimore, Maryland.

ABSTRACT: *Some critics suggest that far too many surgical breast biopsies are performed in the United States. Meanwhile, malpractice suits are on the rise for physicians' failure to detect breast cancer. This creates a paradoxical situation for many physicians. Should the incidence of performing an invasive procedure that may prove inconclusive outweigh the risk to women's health and the possibility of a lawsuit?*

In the past five years, claims against physicians for failure to diagnose breast cancer have risen so sharply that today such suits are common in malpractice litigation.[1] Tens of thousands of surgical breast biopsies are done in this country each year. Some are done because of suspicious mammogram findings, but many are done because of equivocal or inconclusive mammograhic findings. The incidence of positive cancer diagnosis from such biopsies in this country is about one in five. This means four of five operations to confirm the nature of inconclusive mammogram findings result in a nonmalignant diagnosis.[2] Some critics of US statistics suggest we should be more discriminating, and that our rate of positive diagnosis should be one in three or even one in two.

Unfortunately, a better degree of accuracy is not possible given the current state of the art of physical diagnosis and breast imaging. A high degree of suspicion and liberal use of breast biopsy techniques are mandated by the risk to American women and the litigious nature of today's society.

The number of US breast cancer cases diagnosed last year was projected to be 180,000. Malignancy is often hidden from the examining hand and mammographic detection because of the relatively dense character of some breast tissue and the common lumpiness associated with fibroglandular breast disease. Often, dense breast tissue is associated with scattered microcalcification. Although many areas of microcalcifications are compatible with benign breast disease, such as adenosis and papillomatosis, some hide the presence of intraductal carcinoma or small invasive cancers. The

relationship between various patterns of calcification and the underlying pathologic process was addressed recently by Symonds.[3] Current literature indicates that once an invasive breast cancer grows to a diameter of 1 cm, incidence of metastatic disease to the axillary lymph nodes may rise to more than 20%. This disease may compromise the patient's life expectancy.[4] Recognizing and treating breast cancer when a lesion is small directly relates to the patient's long-term survival. Although an occasional cancer of 0.5 to 1 cm is recognized by palpation, mammographic imaging is currently the best method for detecting very small cancers. Some breast densities or scattered calcifications that look and feel benign may hide occult cancer. Therefore, a high index of suspicion and liberal attitude toward biopsy are imperative.

Just as calcification patterns can overlap the benign and malignant spectrum, physical findings of dense focal fibroglandular thickening can obscure or hide even relatively advanced breast cancer. Lobular invasive carcinoma often presents as an indiscreet focal region of tissue density with no clear mammographically suspect image. Such regional or focal physical findings, although compatible with benign fibroglandular breast disease, often require biopsy for critical interpretation. This defensive attitude leads to an increasing number of biopsies for benign breast disease. Such concern also causes radiologists to read mammograms defensively, recommending biopsy even for findings that meet radiographic criteria for benign breast disease with a remote possibility of carcinoma. Follow-up examinations alone, even over long periods, do not offer complete reassurance that one is not dealing with a malignancy.

Some minimally invasive biopsy techniques are of considerable value in many situations. These techniques include fine-needle aspiration cytologic biopsy, core-needle biopsy of palpable lesions, and stereoscopic biopsy of radiographic lesions. Stereotactic biopsy is done almost exclusively by radiologists, but fine-needle aspiration biopsy and cyst aspirations can be done by any examining physician. It is hoped that in the future, radiologists will be more comfortable doing guided cyst aspiration and fine-needle aspiration biopsies on suspicious radiographic shadows, advancing diagnostic accuracy by imaging.

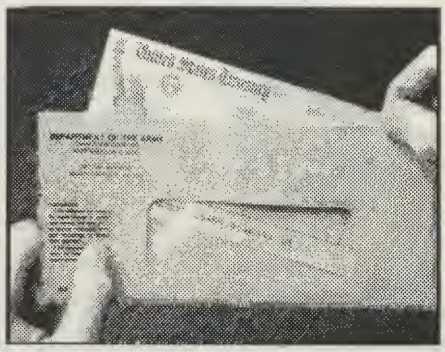
As a surgeon attempting to evaluate many of these situations, I recognize a distinct tendency on the part of many radiologists to state their concern about the most minimal x-ray changes by using gratuitous phrases such as, "I cannot rule out the possibility of a breast carcinoma," or "Biopsy may be advisable if clinically indicated." Such phrases heighten the concern of the physician and patient. The radiologist does not make a specific recommendation, shifting the discussions of risk and the final decision regarding biopsy to someone else. Unfortunately, radiographic changes are often so minimal or ambiguous that only cautionary statements can be made. For maximum benefit to the physician and patient, some relative degree of concern should be clearly stated.

A 1% possibility of a shadow representing malignancy is quite different than a shadow projecting a 10% likelihood of cancer. A 2 mm or 3 mm faint collection of calcification usually defies an attempt at interpretation, but the very presence of calcium deposit often elicits an ominous phrase. Such minimal findings do not require urgent or definitive evaluation. Furthermore, soft tissue density with sharply circumscribed margins and homogenous characteristics do not represent radiographic characteristics of cancer. The fact that perhaps 1% of such soft tissue shadows may constitute medullary carcinoma does not mandate removal of all such lesions. Fine-needle aspiration and core-needle biopsy of palpable findings are simple economical methods of pathologic evaluation.[5–8]

Unfortunately, many surgeons dealing with breast disease do not yet have the necessary experience to evaluate subtle mammographic shadows and may depend entirely on radiologic opinion. Some surgical biopsies are done without the surgeon ever reviewing the radiographic findings. Clearly, optimum patient care mandates that the surgeon involved have some degree of expertise in radiologic evaluation, carefully reviewing mammograms before recommending surgery.

Some centers have increased the rate of positive biopsy by having more than one experienced radiologist or surgeon review such films and concur with the need for biopsy. Second opinions may have real merit in this area. Any physician or surgeon who advises against biopsy after another practitioner recommended it, however, is in a position of increased risk. Differences in opinion are common, and only a thorough discussion with the patient regarding relative risks may protect the physician from subsequent legal action if the dissenting opinion is incorrect. Clear, explicit documentation of such discussions should appear in the physician's record along with the options being offered. This way, the patient can take an active role in the decision-making process.

Some recent malpractice suits focused on the physician's failure to biopsy persistent palpable breast densities having the character of benign fibrous mastopathy in situations in which well-done mammograms showed no evidence of neoplasm. With about 8% of clinical cancers presenting with normal mammographic findings, a careful surgeon should freely use office techniques of biopsy including fine-needle aspiration or core-needle biopsy. Simple office techniques can offer considerable assurance to the patient and physician that a benign process is present. Biopsy, however, is the only means to confirm the nature of many breast thickenings. Radiologists evaluating patients for palpable breast lumps or densities with imaging techniques should include a statement indicating the limitations of imaging studies. Many patients, and sadly many physicians, still deem a negative mammogram as a definitive study.



Extreme anxiety experienced by many women who are made aware of an undiagnosed breast abnormality may often only be alleviated by open tissue biopsy. Other women, aware of the uncertainty, can be managed with options such as careful observation or needle biopsy. The physician, however, must be certain that the patient's welfare is not jeopardized by prolonged observation. Physicians, radiologists, and surgeons should attempt to quantify for the patient the degree of risk associated with any palpable or imaged abnormality. The patient can then participate in decisions regarding observation or biopsy. It is only prudent to view the patient's concern as part of the physician's concern, and deal with the situation accordingly. A negative biopsy becomes a truly therapeutic procedure.

The increasing numbers of surgical biopsies associated with a low rate of malignancy and the necessary biopsies of vague breast thickenings that may represent occult carcinoma are not going to go away. Well-directed needle biopsies are part of the answer to this problem and should reduce the numbers of malpractice cases associated with failure to diagnose breast cancer.

Chronic fatigue cured by nasal surgery

Alexander C. Chester, M.D.

ABSTRACT: *Two cases of severe unexplained fatigue with mid-facial pain and rhinitis are presented. Sinus computerized tomography (CT) findings were minor, but both responded to functional endoscopic nasal surgery with resolution (Case 1) or near resolution (Case 2) of chronic fatigue. Possible mechanisms linking nasal disease and chronic fatigue include reflex etiology and sleep disturbance associated with abnormal nasal airflow. Often not considered by the primary care physician in differential diagnosis of fatigue, chronic sinusitis should be explored as a cause in unexplained cases.*

Alexander C. Chester, M.D., is clinical professor of medicine at Georgetown University Medical Center in Washington, DC. ***Reprints:*** *Alexander C. Chester, M.D., 3301 New Mexico Ave., N.W., Washington, DC 20016.*

Chronic fatigue is a major symptom in 25% of patients seeking primary care.[1] Except for the fewer than half that are physical in cause, a psychological basis is often suggested.[2,3] Although chronic sinusitis is mentioned in rhinologic texts[4] and popular press[5] as a cause of chronic fatigue, it is absent in the standard internal medicine differential diagnosis.[6] Reviews of chronic fatigue fail to consider possible nasal causes.[1,7] The following two cases document resolution of chronic fatigue after functional endoscopic nasal surgery.

Case 1. An 18-year-old woman reported a sudden onset of fatigue, unrelieved by 12 to 18 hours of sleep per day. Symptoms included persistently drooping eyelids, nasal congestion, and weak extremities. One month after onset, she noted a mid-facial headache. Except for occasional allergic rhinitis, past medical history was unremarkable.

Five weeks after the fatigue began, physical examination and routine laboratory tests were normal. An initial monospot test was positive, but negative on three rechecks. IgG and IgM antibody titers to the Epstein-Barr viral capsid antigen were 1:160 and <1:10, respectively, confirming the initial monospot to be a false positive. Serum thyroxine, thyroid stimulating hormone, serum magnesium level, and erythrocyte sedimentation rates were normal. No symptoms suggested sleep apnea, primary sleep disorder, or depression as the cause.

Mid-facial headaches prompted an otolaryngological consultation, disclosing findings consistent with vasomotor rhinitis. Intradermal allergy skin testing was negative. Decongestants, antibiotics, local nasal steroid spray, and systemic steroids provided no relief. Computerized tomography (CT) examination of the sinuses demonstrated only mild right middle and inferior turbinate mucosal thickening.

Five months after onset, bilateral functional endoscopic nasal surgery was performed, including partial anterior ethmoidectomy and removal of a small amount of polypoid tissue in the left infundibular region not evident on CT examination. Fatigue resolved immediately and did not recur in the ensuing six months.

Case 2. A 34-year-old man reported a 10-year history of fatigue that began suddenly. Since its onset, it was associated with new frontal, mid-facial, and perinasal pain. Although able to work, he slept 12 hours a day, required frequent naps, and restricted his elective activities to less than half of those desired. Additional symptoms included rhinitis, decreased concentration, aches, sweats, photophobia, and occasional sore throats. Repeated extensive medical evaluations were unrevealing. Citing the sudden and unexpected onset, he repeatedly and pointedly rejected depression as a possible etiology. Evidence of primary sleep disorder or sleep apnea was absent.

Because of mid-facial pain suggesting sinusitis, he underwent nasal septum reconstruction, bilateral inferior turbinate submucous resections, and submucous resection of the right middle turbinate. Mid-facial pain and fatigue improved. Prompted by the response, however partial, a CT scan of the sinuses six months later demonstrated chronic bilateral ethmoidal sinusitis. One year after the initial procedure, he had functional endoscopic nasal surgery, including bilateral endoethmoidectomy, sphenoidectomy, and maxillary meatoplasty with polypectomy. His fatigue is almost entirely gone, and associated symptoms have resolved.

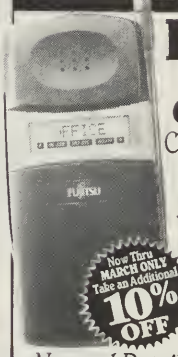
Discussion

In both cases, sinusitis and associated nasal problems manifested primarily with mid-facial pain. Such problems cause fatigue, according to rhinologic texts and popular press, but are usually not mentioned as causes in internal medicine literature.[6] Clearly, nasal stimulation or occlusion can result in profound respiratory and cardiovascular changes.[8–10] Experimental nasal obstruction causes fatigue, dyspnea, and other physical complaints.[11] Cottle believed abnormal nasal airflow alone may produce ill health. Nasal valve movements, he also maintained, are largely responsible for rest obtained during sleep.[8] Many years ago, reports described the resolution of fatigue and other illnesses with nasal surgery.[12,13]

Nasal symptoms are common in unexplained chronic fatigue syndrome, as well as sick-building syndrome which is also associated with fatigue.[14–16] Some criteria for chronic fatigue syndrome might be nasal in origin (e.g., sore throat and tender anterior cervical lymph nodes).[17] A possible evolutionary significance to this relationship has been postulated.[18]

Lavie documented sleep disorders in many patients with even mild nasal obstruction.[19] Micro-arousals and brief periods of awakening occur through the night, causing nonrestorative sleep. Moldofsky describes a similar sleep pattern in postviral fatigue syndrome.[20] Surgical correction or medical therapy of allergic swelling usually reverses sleep disorder and associated fatigue.

Absence of radiographic findings is common. In only 62% of those with clinical diagnosis of sinusitis are abnormalities noted on CT examination.[21] One study noted maxillary fluid on aspiration in 24% of those with normal radiographs.[22]



Sinus disease can cause fatigue through a number of possible mechanisms. As a treatable cause of otherwise unexplained chronic fatigue, it should be carefully considered in all cases.

Health Access America

The AMA proposal to improve access to affordable, quality health care.

"I can't afford to go to the doctor."

We hear that a lot from our patients these days. For the 33 million people who have no health insurance, it's a particularly acute problem.

That's why the AMA has launched a proposal to improve access to affordable, quality health care. It's called *Health Access America.* The message is being sent to Congress, the media, labor and management organizations, concerned groups like AARP, and your fellow physicians.

Simply, *Health Access America* proposes health insurance coverage for all Americans, regardless of income or health status. It calls for expanded publicly-funded health care for the needy; a stronger Medicare system; employer-provided coverage for all workers and their families with tax incentives for small businesses.

America's physicians are leading the way to reforming the health care system by speaking out on these critical issues.

To get a copy of the *Health Access America* proposal, please call our Member Service Center at 1-800-AMA-3211.

The American Medical Association

on behalf of member physicians and their patients.

Maryland physicians on a humanitarian mission to war-torn Croatia

Bernhard Laukenmann, M.D.

Dr. Laukenmann is a staff anesthesiologist at Memorial Hospital at Easton, MD, Inc., Easton, Maryland.

ABSTRACT: *Six physicians from Maryland, California, and Utah participated in a 10-day humantarian mission to Croatia. They spent long hours in antiquated operating rooms performing maxillofacial and extremity reconstructive procedures; most patients were young or war-injured males. Though not a third world country, Croatia urgently needs finances to acquire drugs, supplies, textbooks, and equipment.*

The situation in Croatia is dramatic and chaotic: high inflation, unemployment, overall loss of buying power, and ethnic and religious strife. The fear of war again is great. There is, on the other hand, hope for peace and an association with the Common Market, although no authorized proposals have yet been made.

Economic conditions are chaotic. One year ago, the first wholly free elections since 1945 were held in Slovenia and Croatia. Nothing is settled in the previous Yugoslavian regions. Stalin told Tito that in "this war [World War II]... whoever occupies a territory also imposes on it his own social system." But recent historical events decided otherwise. The civilization of central and eastern Europe, which includes Croatia, is integrally linked to the civilization of western Europe.

Problems are enormous following the politically obsolescent, economically unworkable structure, and intellectually discredited Communist-Socialist system disintegration. Croatia's health care delivery system depends almost completely on support from the United Nations, International Red Cross, and private or corporate donations from the Common Market and United States.

I participated in a 10-day humanitarian mission to Croatia with a group of five other physicians from California, Maryland, and Utah. Prior to departure, each physician participant collected and packed drugs, supplies, medical instruments, and loan monitors donated from various pharmaceutical companies, medical suppliers, and hospitals. The group was headed by

Sonja Hagel, who was accompanied by camera operator Dominic Vlasic; Mr. Vlasic speaks fluent Croatian and German.

We left the United States the night of January 8, 1993, from the east and west coasts, respectively, and met collectively for the first time the following morning in Frankfurt, Germany, where we were briefed about our itinerary and work schedule for Croatia.

Delta Airlines and Croatian Airlines graciously shipped the voluminous freight gratis to the Clinical Hospital Center, Split, Republic of Croatia.

Sunday morning (January 10) we made rounds with Croatian colleagues at the Institute of Mother and Child Health (Institut za Zastitu Majki I Djece) under the guidance of pediatric surgeon Ivan Fattorini. The following day, patients were selected for surgery. Because our group consisted of two anesthesiologists and four plastic and reconstructive surgery specialists, trauma patients and those with congenital deformities headed the list. Supplies were sufficient, and monitoring equipment and anesthesia delivery systems were adequately functional but antiquated.

In late afternoon, group members presented lectures followed by question and answer periods. English and German permitted easy communication.

Since the group's purpose, dubbed "Second Chance," was to assist or perform selected complicated reconstructive procedures primarily on war-injured patients, we flew late at night to Split, a historical ancient port city on the Adriatic in southern Croatia. Two hospitals—Clinic A, a civilian hospital, and Clinic B, the previous Yugoslav Navy Hospital—held many combat casualties who were transferred there after initial care in the field in Croatia and Bosnia.

Long hours were spent in the operating rooms performing maxillofacial and extremity reconstructive procedures, as well as elective cases of syndactyly corrections and cleft palate repairs. Most patients were young or middle-age war-injured males in various stages of recovery and in otherwise good general physical condition. Surgical supplies, though scarce, were adequate with improvisations and flexible techniques. Drugs, especially for anesthesia, were very limited. One basic anesthesia routine was used: total intravenous technique with sodium pentothal, fentanyl, and Innovar (fentanyl citrate/droperidol), which is very popular because of its availability. Muscle relaxants were succinylcholine and Pavulon (pancuronium bromide).

Old anesthesia machines delivered centrally piped oxygen and nitrous oxide. I have practiced anesthesiology for 30 years and never operated machines such as these. Only halothane vaporizers were available. Except for old cardioscopes, which often malfunctioned, monitoring equipment was absent. Blood pressures by oscillometric observation and pulse palpation were basic monitoring. Use of the precordial stethoscope was not routine.

Because of inflation and economic depression, lack of hard stable currency is the primary commodity contributing to the shortage of things needed for patient care. The medical library is also in dire need of updating and expansion.

The Croatian doctors are very dedicated, well informed, and well trained. Many have hands-on experience from Switzerland, England, France, Austria, and Germany. Very few have US training, although some were visiting observers in the United States prior to Croatia's independence. Several young anesthesiology and surgery residents inquired about US training opportunities. The major stumbling block appears twofold: financing the journey and the Education Commission for Foreign Medical Graduates passing score requirement.

The nursing staff is very pleasant, cooperative, and dedicated—and poorly paid at about the equivalent of $75 a month. Physicians are salaried at approximately $200 a month.

Health care is free and of equal standard for every patient. The future structure of the health care system, however, is undecided. We were honored with a reception given by the Croatian Minister of Health in Zagreb, a combat-experienced surgeon. He told us work is in progress by the present government under President Tudsman to develop a definitive health care system, probably modeled after the German system.

On January 18, our hosts drove us to Mostar on the Neveret, a city in Bosnia that suffered heavy damage and casualties in the war. (Fighting erupted again the next day and four days later.) Guarded steel roadblocks were evident at the mountain pass before entry into the city. Both hospitals were targets of artillery and suffered structural damage. With armed personnel everywhere, an air of uneasiness was pervasive.

The administrator and chief surgeon of both hospitals led us on rounds through the institutes. One hospital is located in the city center, the other in a suburb. The damage caused by previous shelling was very apparent. Little reconstruction had been done due to lack of money and materials. The doctor had not been paid salary for nearly two years. He lives on hospital food and works under very adverse conditions. During the siege of Mostar, nothing could move in or out of the city for 90 days. Two surgeons, an anesthesiologist, and a nurse were killed during an ambush against their ambulance. Ambulances are now camouflaged.

The hospitals are solely dependent on United Nations and Red Cross supplies. Many patients are warded in the boiler room and subterranean cellar corridors. The whole city was cut off from electrical power, and when the diesel fuel supply for the hospital generators was expended, car batteries provided some power and then candles. The destruction of parts of the city resembles central Europe at the end of World War II. All bridges across the Nevetra River, except one 500-year-old pedestrian crossing, have been destroyed.

En route to Mostar, we briefly visited a refugee camp. Men huddled or walked about quietly. Women washed belongings at a cold water tank in the outside courtyard of the gymnasium, where refugees were housed. Children sat quietly with their parents or moped about. A local doctor treated minor urgent health problems and made referrals to outlying operative hospitals.

Basic foods were supplied and cooked in a makeshift community kitchen courtesy of the Italian government. The faces of many of the homeless expressed deep pain and sorrow. The number of refugees in Croatia would be equivalent to 40 million refugees in the United States based on the respective population ratio.

When we returned to Split, we had another long, productive day in the operating rooms. Lectures were part of our obligation and were well received in Zagreb and Split.

The day before our departure from Croatia, the mayor of Split and city health authorities accompanied us on a long excursion by helicopter over islands in the Adriatic Sea to Vela Luka on Korcula Island. We visited the local hospital and rehabilitation center, seeing state-of-the-art procedures in rehabilitation and orthopaedic surgery.

This landscape and sea resort is breathtaking, and its inhabitants are extremely hospitable. Homer, over 2,000 years ago, included Korcula's beauty in rhyme in *The Odyssey*. The surroundings completely veiled the aura of a war in progress less than an hour's flight away.

The most impressive part of the journey was a visit to Toplice Rehabilitation Center approximately 75 miles northeast of Zagreb. Nearly 900 beds were occupied, mostly by war-injured of all kinds. Brief clinical presentations showed the fury and misery of hapless victims of war: a 3-year-old girl clasping her floppy-eared stuffed animal with her right arm because she was a left-sided hemiplegic with total cortical blindness from a shrapnel head injury; a 23-year-old above-knee amputee soldier with multiple shrapnel scars suffered during an attack in which his wife and infant son were killed; a 21-year-old male paraplegic from a sniper bullet lodged in his spine; a young boy who lost both arms. The victims needed prosthetic devices unavailable because of lack of funds in the economically ravaged new republic. The younger patients would need frequent replacement devices to adjust to growth. But the Toplice institute is unsurpassed in its delivery of care due to the dedication and expertise of its staff.

The journey drove home to me what the human will can perform against overwhelming odds and strengthened my sense of purpose in the craft with which I earn my living, bringing to it even more enthusiasm and compassion. The medical community in Croatia performs at the highest standard of care in the fields in which I have been involved: anesthesiology, reconstructive surgery, and rehabilitation.

There is an urgent need for finances to acquire drugs, supplies, instruments, monitors, updated textbooks, medical periodicals, and to upgrade postgraduate continuing education, replace antiquated equipment, and step forward into computer-facilitated medical technology.

Croatia is not a third world entity; there are good road systems, telecommunications including fax systems, mass transit transportation, and modern housing. For Croatia, the word "Europe" not only represents a phenomenon of geography but a spiritual notion synonymous with the word "west."

Our mission benefited Croatian colleagues and patients. It could be a success if we in the "west" are financially supportive. The necessary legal paper work is in progress for charitable donations.

Participants of "Second Chance" were Brian Kinney, M.D.; Bernhard Laukenmann, M.D.; Burr Von Mauer, M.D.; Roger Orsini, M.D.; John Walker, M.D.; Sonja Hagel, R.N.; and Dominic Vlasic of Video Productions. ■

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

The first American medical school

Joseph M. Miller, M.D.

ABSTRACT: *John Archer, a physician from Harford County, was one of the graduates of the first medical school on American soil–Philadelphia College–in 1768. The names of the initial instructors, including John Morgan, William Shippen, and Thomas Bond, and of the first graduates, including John Archer and Jonathon Potts, are well known to most medical historians. Many of these early American physicians had a deep sense of political commitment, and placed conscience and love of country above their medical practices.*

Dr. Miller is a retired surgeon from Timonium, Maryland.

John Archer, B.M., of Harford County, is moderately well known to many doctors in Maryland because his biography was presented previously in this journal.[1] Of major interest, because of the approaching bicentennial celebration of the Medical and Chirurgical Faculty of Maryland, is the fact that, in 1799, the General Assembly of Maryland permitted the incorporation of the Faculty; Archer and his son, Thomas, were among the incorporators.[2,3]

Archer's preliminary education was obtained at the West Nottingham Academy where one of his classmates was Benjamin Rush.[4,5] Obtaining an A.B. and an M.S. at Princeton, Archer embarked upon the study of theology under Presbyterian auspices in 1762. In August, and again in December of 1764, however, the Presbytery of New Castle denied him the privilege of pursuing a theological career. Rebuffed at this point, Archer turned to medicine and "read" with Dr. Thomas Morgan in the spring of 1765 in Philadelphia. In the fall of that year, a successful effort to create a medical school was consummated in that city, and Archer continued his education in the initiatory course of medical lectures at the Philadelphia College.

Some American physicians of the eighteenth century, trained in the great European medical schools, realized that medical education in the colonies was sorely lacking in many respects. Apprenticeships offered a poor, meaningless form of instruction because students could not properly

visualize and understand the diseases and trauma they were expected to treat. In addition, education given in a nonsystematic manner can be self-defeating. The concept of medical teaching with practical experience in a well-defined curriculum is the foundation of the method by which good doctors are made, but such is not possible unless three factors are joined: a university to provide the academic stimulus and environment; a hospital to ensure that patients with a wide spectrum of diseases are available for study; and a medical school. All institutions should be under one system of guidance.

These thoughts must have been in the minds of certain individuals in Philadelphia at that time.[6-8] The capital of the Penn domain and the largest colonial city with a population of 25,000, however, did not even possess an institution of higher learning, but the necessary steps to produce a satisfactory medical school were taken here serially.

Benjamin Franklin wrote at that time, "The first drudgery of settling new colonies is now pretty well over, and there are many in every province in circumstances that set them at ease and afford leisure to cultivate the finer arts and improve the common stock of knowledge."[9] In 1743, Franklin asked the colonists to start a Philosophical Society for the promotion of useful knowledge among British plantations in America. The proposal was well received and was accomplished most successfully.

The next step was the creation of an institution of higher learning in which, again, Franklin had a great part. The formal opening of an academy occurred in 1751, and the undertaking was so outstanding that the trustees obtained a charter from the proprietors in 1753. The beneficial achievements of the "Academy and Charitable School in the Province of Pennsylvania" led to a second petition to permit the conferring of collegiate degrees. The "College and Academy of Philadelphia" granted its first baccalaureate degrees in 1757.

In his autobiography, Franklin related that Dr. Thomas Bond conceived the idea of creating a hospital for the "sick, injured, and lunatics" in the city. Chartered in 1751, it opened a year later. The founders of the institution thought that it would also provide instruction for young individuals aspiring to become doctors. Most of them would be apprentices of the attending physicians, although others without such formal attachment could attend.

This teaching, however, could not furnish the systematic framework so necessary for a good medical education. Some students, aided financially by their parents, went to one of the professional schools in Europe to complete the education afforded by an apprenticeship.

The earliest mention of a medical school in Philadelphia occurred in a letter from Dr. John Fothergill of London to James Pemberton of Philadelphia recommending that Dr. William Shippen, Jr. give a course in anatomy. Fothergill also noted that Dr. John Morgan would soon return to the city to help Shippen start such a school.

The great physicians of London in the period of 1750 included Fothergill, a devout Quaker, whose father and brother were eminent preachers who traveled extensively in the colonies. Familiar with the plans of Morgan and Shippen, Fothergill told Pemberton that these individuals would be able to "erect a school for physic." Pemberton, a Quaker merchant and philanthropist, was an ideal person to further this scheme. He became a member of the first Board of Managers of the Pennsylvania Hospital and served on the board for 22 years.

In 1762, Shippen returned from London to teach at his private school of anatomy, but awaited the homecoming of Morgan and others to form a medical faculty. Morgan came back in 1765 with a well-conceived plan for a medical school in mind. A brilliant student at Edinburgh, where he received his doctorate in 1763, he was well qualified to father an institution to train physicians. He formulated a proposal to introduce new professorships into the college for the instruction of those individuals inclined toward the study and practice of physic and surgery. The trustees of the college were greatly impressed and appointed him professor of the theory and practice of physic.

Aware of the importance of the establishment of medical education in the colonies, the authorities invited the new professor to address the graduates at the next commencement. Fully conscious of his responsibility in this innovative procedure, Morgan sketched a plan to include the branches of medicine that should be offered at the new institution: anatomy, materia medica, botany, chemistry, and the theory of medicine and practice.

Shippen was, of course, disappointed that he did not have the leading role in the new enterprise inasmuch as he had plans of his own for a school. He did, however, apply to the trustees for a professorship in anatomy and surgery, which was immediately granted.

The courses given by Morgan (materia medica) and Shippen (anatomy and surgery) did not constitute a complete medical curriculum, and the institution may have been poor in comparison with its European counterparts. It was, however, infinitely better than the training provided by an apprenticeship. The medical teaching at the college was buttressed by clinical lectures given by Thomas Bond at the hospital, who, strangely, was never made a professor. He taught well and continuously, and had a deep interest in pathology as a method of obtaining disease information that was otherwise not available.

Among those who had instruction in the first three sessions were the 10 individuals who received a degree in 1768. In addition, other experienced apprentices undoubtedly were classmates, although they did not bother with the examinations or degrees.

On June 21, 1768, the students who had completed the plan of studies in a satisfactory manner were awarded a bachelor of medicine degree. The trustees, conscious of the incompleteness of their academic curriculum, decided not to award the doctorate as they thought they might be presumptuous to claim equality for

their three-person school with those older and better-staffed European institutions. Three years later, four members of the first class (Elmer, Potts, Tilton, and Way) returned to present their theses and receive the doctor of medicine degree. In 1789, the college abandoned the experiment of offering two degrees. This step may have been taken in retrograde fashion; for a century, schools without university connections offered the doctorate, which meant that the degree became meaningless as evidence of professional qualifications. Firm standards against which to measure the quality and depth of medical preparation did not exist, and medical schools were free to graduate and endow whom they pleased. Proprietary medical colleges were chartered by state legislatures in defiance of any attempt at control. Certainly this was not a state which Morgan and Shippen would have desired.

A few years after their graduation from the college, most of these men became part of a great revolutionary process by which a democracy, an example to the rest of the world, would be born. They, along with their older medical colleagues who were involved with the formation of the Declaration of Independence and the Constitution, had a deep sense of political commitment that is rarely seen in medical circles today.

The earlier group, being older and more mature, courageously pledged their lives and fortunes to create a new country. They acted as if they had heard the voices of Plato, Adlai E. Stevenson, and John F. Kennedy talking about citizenship and its responsibilities. They were not compromising politicians well versed in the service of government, but were, instead, extraordinary people for their times who saw their duty and did it.

The newly graduated group **(Table 1)**, whose average age was a little over 25, nevertheless, strongly resembled their older colleagues.[10] They sought and accepted armed service as necessary to engender their new country. They were well-educated, native-born Americans who, in a historically critical moment, placed conscience and love of country above their medical practices.

Three members of the group had received a bachelor of arts degree and one, a master of arts degree, from Princeton before attending the medical school. Having previously been given the bachelor of medicine, four men returned in three years with a Latin thesis and qualified for the doctorate degree.

These men were astute, patriotic, and willing to serve their country. Eight of these men were surgeons in the armed forces, and two of them died as a result of a service-connected illness. Two were members of a Provincial Congress, and three of a Continental Congress. One was later elected to the House of Representatives, and one to the Senate. Some were prominent in their state legislatures, and five became members of the American Philosophical Society. Franklin, Morgan, Shippen, and Bond could well be proud of this exemplary group whom they aided at the start of their medical careers.

John F. Kennedy might have had these men in mind when he pronounced his well-known philosophical charge: "Ask not what your country can do for you. Ask what you can do for your country." These early physicians were an incomparable group, able to approach and treat the problems of war and then return to an excellent civilian existence. The class of 1768 could serve well as a model to future generations of doctors.

Table 1. The ten graduates of the first American medical school

Name	State	Previous degree(s)	Degree in 1768	Degree in 1771
John Archer	Maryland	A.B.,M.S.	B.M.	-
David Cowell	Pennsylvania	A.B.	B.M.	-
Samuel Duffield	Pennsylvania	-	B.M.	-
Jonathon Elmer	New Jersey	-	B.M.	M.D.
Humphrey Fullerton	Pennsylvania	-	B.M.	-
David Jackson	Pennsylvania	-	B.M.	-
John Lawrence	New Jersey	A.B.	B.M.	-
Jonathon Potts	New Jersey	-	B.M.	M.D.
James Tilton	Delaware	-	B.M.	M.D.
Nicholas Way	Delaware	-	B.M.	M.D.

Patients' rights in a nursing home

Henry E. Schwartz, Esq.

Mr. Schwartz is a partner in the Health Care Department of the Baltimore law firm of Gordon, Feinblatt, Rothman, Hoffberger & Hollander

ABSTRACT: *Under state and federal law, nursing home residents have many rights, including the right to be treated with respect, to receive reasonable accommodation to individual needs, to not be abused, to be free from unwarranted restraints, to refuse treatment, and to participate in treatment planning. Physicians need a working knowledge of certain fundamental legal concepts in order to help patients, particularly with regard to withholding or withdrawal of life-sustaining treatment.*

Many physicians are called upon to provide advice to patients in, or considering placement in, nursing facilities. In both situations, physician advice and counseling are critical to the physical and emotional well-being of both the patient and the patient's family.

Although physicians are, of course, comfortable giving medical advice in such situations, they are also often called upon to give legal advice or, at least, have some working knowledge of certain legal principles. Accordingly, physicians need some familiarity with the rules that apply to long-term care.

Residents' rights

Under state[1] and federal[2] law, residents in nursing facilities have the following rights, among others:

- The right to be treated with consideration, respect, and full recognition of human dignity and individuality
- The right to reasonable accommodation to individual needs and preferences
- The right to be free from mental and physical abuse
- The right to be free from physical and chemical restraints, except those ordered by a physician for clearly indicated medical needs
- The right to participate in the planning of medical treatment
- The right to refuse medication or treatment

An important right is the right to be informed about, and participate in, the care and treatment provided at the long-term care facility. This applies not only to initial admission and the medical care provided, but to other aspects of daily life in the facility, such as meal times, bed times, food, entertainment activities, and even the resident's attire.

A physician who is sensitive to these issues can assist the resident or resident's family in making sure that the resident's rights are respected, and that the resident retains, to the fullest extent possible, dignity and maximum control over the living environment. Such issues can be critical in the successful adaptation of the resident to the nursing facility.

Health care decision making

A competent resident's right to make decisions regarding care includes the right to refuse medication or treatment. Difficulties arise, however, when the resident is not competent to make these decisions. In such circumstances, the physician can play a key role in assisting the resident and resident's family in preparing for such decision making, and in making such decisions when the need arises.

Substitute decision making for patients who are not competent is a complicated legal, medical, and ethical issue. Much has been written about this subject, and the attorney general of Maryland has tackled the issue in two lengthy opinions.[3] The attorney general has also issued a short memorandum on the subject, which is to be provided to all residents of Maryland nursing facilities. The memorandum outlines the three methods under Maryland law by which a competent person can designate, in advance, how medical decisions should be made once that person is no longer competent to make those decisions:

- A living will can provide for the withholding of life-sustaining treatment for a patient with a terminal condition.
- A durable power of attorney for health care can allow a designated person as much decision-making authority as the patient wishes to delegate.
- A patient may describe to the physician those decisions he or she has made with regard to the providing or withholding of life-sustaining treatment. If this information is provided, it should be documented in the patient's medical record at the time that it is provided.

If none of these avenues are taken in advance of incompetency, there are circumstances in which family members may be in a position to exercise decision-making authority short of a court-ordered guardianship. While the law clearly provides this type of authority for **consent** to medical care, there is some question as to the right of family members to **withhold** care without other specific legal authority.

Although a lawyer should ideally be involved in substitute decision making, the physician can and should play a major role on such occasions. Patients are in need of medical advice concerning their options for advanced decision making, and family members required to make such decisions need counseling with regard to medical options, quality of life expectations, and determination of what the desires of the patient would be if the patient were able to express those desires.

Physicians are increasingly called upon to assist patients and families in dealing with nursing home placement, care provided in such facilities, and thorny questions regarding the withholding or withdrawal of life-sustaining treatment. As a result, a working knowledge of certain fundamental legal concepts is a necessity for physicians to help patients with these difficult problems.

)FFICE AUTOMATION FROM KEYSTONE

ystems and realize we can't grow—
)ur computer from Keystone."

arol Matthews, President
ebanon Medical Management, Inc.
ebanon, PA

"We've been with Keystone for ver eight years. They've always rovided us with options as we've rown and done whatever it takes o keep the system up and running. **heir support is worth every enny."** **Carol Matthews**

Keystone has designed a system hat allows you to start with the asics (Accounts Receivable, illing, Practice Analysis and lectronic Claims) and add on other apabilities as you need them. KMS ives you a total picture of your nvolvement with the patient—and rovides you with all pertinent information easily and instantaneously. Among the KMS modules receiving praise from the industry and our clients are Patient Scheduling, Intelligent Payment Posting, and Credit and Collections.

"We were searching for a company sophisticated enough to support the growing demands of our company, and we found that in Keystone. **The KMS Credit and Collections module saves us 25% in manhours.** *It allowed us to convert from a manual collections system that took forever to a computerized system—without having to change our collections style one bit."* **Cindy Groux**

"Their system ties all of our offices together, *letting us keep track of everything that goes on—every facet of the practice—electronically. We feel secure that the business end is running expertly and efficiently. When I think how inaccurate we might have been before KMS, I know we couldn't survive now without it."*

Choose Riverview

When evaluating nursing homes, there are many factors to consider. So, you should consider the following about Riverview Nursing Centre.

✦ Newly remodeled Riverview is ideally planned for eldercare, and offers a tasteful blend of antique and traditional furnishings.

✦ Riverview offers two pay plans - standard and deluxe. And unlike many other nursing homes, there are no hidden charges.

✦ Low staff turnover. Riverview has an experienced and stable nursing and care staff. In fact, Riverview is so well respected, it has been chosen as an on-site teaching facility for nursing students at Essex Community College.

It makes Riverview the ideal choice to provide loving care for your loved ones. For more information call Amy Bauer at 574-1400.

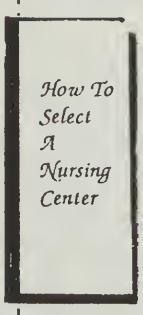
Are families in your practice struggling with the demands of caregiving? Where will they turn for guidance?



As your practice ages, you may be faced with more and more requests for information about caregiving and long term care. Many families are just not prepared—and feel uneasy about making a long term care decision. Perhaps you've had families ask: *"What should we look for in a nursing center?" "How do we decide which center is best?" "How many centers should we visit?"*

Manor Care Nursing and Rehabilitation Centers would like to help by offering you a free brochure designed to help your patients and families evaluate nursing center services. It's called "How to Select a Nursing Center." And, as part of our continuing public service effort, we are offering this brochure free of charge to physicians in the Washington/Baltimore area.

Call one of the centers listed below, or mail in the coupon and we'll send you a package of 25 copies of "How to Select a Nursing Center." Or, if you'd like more information about specific services we offer, call and ask to speak with an Admission Director or Medical Director.

THREE GOOD REASONS TO CHOOSE KESWICK

CAREY HOUSE: "Carey House is the perfect setting for independent seniors. I should know – I'm independent and this is just what I need." -- MS. MARY CAFFEE

LONG-TERM CARE: "I like the privacy of having my own room and no roommate. Keswick is a nursing home in a nice neighborhood, close to my friends." -- MRS. ELIZABETH PLUMMER

ADULT DAY CARE: "My father has Alzheimer's Disease and Keswick's Adult Day Care program is perfect for him. My father now attends full time and I've returned to work with the peace of mind I need." -- MRS. SHARON FRANK, DAUGHTER OF "WES" TACE

These are just a few reasons why you should choose one of Keswick's three programs for your loved one. When you consider how content others are with Keswick, it's easy to see how all of these reasons really add up.

Keswick	CAREY HOUSE	Keswick

JOHNS HOPKINS HEALTH SYSTEM

What your patient can remember is remarkable. What she's forgotten is heartbreaking.

As Alzheimer's Disease Progresses, it is not unusual for its victims to have clear memories of childhood, yet not recognize those dearest to them. It is this tragic symptom and others that make Alzheimer's as devastating to a victim's family as it is to the victim.

In conjunction with consultants from the Dementia Research Clinic at the Johns Hopkins University School of Medicine, Meridian Healthcare has supported a series of studies aimed at innovating new and better ways of caring for the memory impaired.

Meridian's leadership role in supporting dementia research resulted in the first Alzheimer's care unit modeled on principles of modern psychiatry. Today that research is embodied in a program called Focus, now in place at three Meridian Healthcare centers in Maryland.

The goal of Focus is to prolong the independence of the memory impaired by sharpening their remaining abilities. Focus offers an individual program of care for each patient, provided by a specially trained staff in a secure and structured residential environment. For families struggling to cope with the consequences of their loved one's illness, Focus offers education, counseling and support.

If you have a patient who has Alzheimer's Disease, ask for our free Focus brochure. While there is no cure, Focus offers the care your patient – and your patient's family – needs.

Mental illness has warning signs, too.

Withdrawal from social activities. Excessive anger. These could be the first warning signs of a mental illness. Unfortunately, most of us don't recognize the signs. Which is tragic. Because mental illness can be treated. In fact, 2 out of 3 people who get help, get better.

For a free booklet about mental illness, call the National Mental Health Association:

Imaging Case of the Month

A 25-year-old male presented with progressively worsening acromioclavicular joint pain following a fall onto the shoulder while skiing. Initial radiographs revealed no evidence of fracture or other osseous abnormality. A radiograph (**Figure 1**) was obtained approximately three months following the injury. A magnetic resonance imaging (MRI) examination performed at this time included T_1 weighted (**Figure 2**) and T_2 weighted (**Figure 3**) oblique coronal images of the shoulder.

Figure 1.

Figure 2.

Figure 3.

Post-traumatic distal clavicular osteolysis

Osteolysis of the distal clavicle represents a relatively rare complication of direct trauma to the acromioclavicular joint. Although the inciting injury often involves acute separation of the acromioclavicular joint, repetitive minor trauma has also been implicated as a potential cause. Clinically, the patient presents with pain and weakness that progressively worsens as the osteolysis progresses. Treatment consists of immobilization or, in more severe cases, surgical resection of the distal clavicle. Without treatment, the lytic phase usually persists for 12 to 18 months and may involve up to 3 cm of distal clavicle. A reparative process follows the lytic phase, but chronic pain and disability often persist. Minor trauma, years later, may reactivate the process.

The pathogenesis of this disorder remains uncertain, but several potential mechanisms have been proposed. Osteoclastic reaction and resultant bone resorption may be triggered by hyperemia, angiomatosis, and synovial hyperplasia—a nonspecific soft tissue response to trauma. Autonomic nervous system activation may also play a role in mediating increased blood flow and subsequent osteoclastic and synovial stimulation.

Conventional radiographic evidence of osteolysis typically develops within one month of injury, but delayed onset has also been reported. MRI findings of marrow infiltration and synovial reaction may precede conventional radiographic evidence of osteolysis, potentially permitting earlier diagnosis and therapeutic intervention.

A Clinical Moment with Diabetes

Diabetes and thyroid disease

It is vital that physicians caring for patients with diabetes mellitus appreciate the importance of potential interactions with thyroid diseases. First, the two disorders occur in the same patient relatively often due to their common autoimmune pathogeneses. Second, thyroid dysfunction can have a significant impact on glycemic control, particularly in hyperthyroidism. Third, clinical and laboratory diagnosis of thyroid dysfunction in patients with poorly controlled diabetes may be challenging. Finally, there are certain special considerations in the treatment of hyperthyroidism and hypothyroidism when there is co-existing diabetes mellitus.

Patients with either diabetes or autoimmune thyroid disease are reciprocally predisposed to develop the other disorder (**Table 1**). Both hypothyroidism and hyperthyroidism are more common in patients with diabetes, as is the transient thyroid dysfunction that occurs in women during the postpartum period. Furthermore, other subtle evidence of thyroid disease that may later blossom into overt hypothyroidism is quite common. Subclinical hypothyroidism is a state in which the serum thyroid stimulating hormone (TSH) is elevated despite a serum T4 concentration that remains within the normal range. Despite its name, subclinical hypothyroidism, in some patients, may be associated with reversible symptoms attributable to mild thyroid hormone deficiency. Many physicians choose to treat patients with subclinical hypothyroidism if (1) they have symptoms; (2) if they have detectable serum antithyroid antibodies, which predict a relatively high rate of subsequent frank hypothyroidism; or (3) if they have an elevated serum low-density lipoprotein (LDL) cholesterol concentration, to which hypothyroidism may be contributing.

Table 1. Diabetes and thyroid diseases: Reciprocal predispositions

Thyroid disease in diabetes

- Hypothyroidism: 3%
- Subclinical hypothyroidism: 13%
- Hyperthyroidism: 1%
- Postpartum thyroiditis: 11%

Diabetes in thyroid disease: 2-3%

Conversely, patients with thyroid dysfunction due to either Graves' disease or autoimmune (Hashimoto's) thyroiditis are more likely to develop diabetes mellitus, particularly insulin-dependent diabetes. Such patients have been shown to have a higher prevalence of anti-pancreatic islet cell antibodies, just as individuals with diabetes are more likely to have antithyroid antibodies. The fundamental pathogenesis of these autoimmune endocrine diseases is not understood, although there is clearly a familial predisposition, and genetic characteristics of the immune response (e.g., certain histocompatibility antigen types) have been implicated.

Thyroid dysfunction may have an impact on glycemic control in the patient with diabetes. Hyperthyroidism is typically associated with worsening of glucose intolerance, whereas hypothyroidism has little effect on glucose tolerance in most patients, but may occasionally decrease a diabetic patient's insulin requirement. Although a number of factors may contribute to impaired glucose tolerance in hyperthyroidism, the literature is contradictory. It is clear, however, that there is more rapid gastrointestinal glucose absorption in thyrotoxicosis.

Practically speaking, there are several implications for patients who have both diabetes and hyperthyroidism. First, one must be cautious about diagnosing glucose intolerance in thyrotoxic patients, since glycemic control may improve with treatment of hyperthyroidism. Second, hyperthyroidism should be considered in the differential diagnosis of unexplained worsening of diabetic control. Third, one should anticipate possible worsening of glycemic control in diabetic patients who develop hyperthyroidism and lower blood glucose levels with restoration of euthyroidism.

The diagnosis of thyroid disease in patients can be challenging. The common clinical manifestations of poor diabetic control and hyperthyroidism (i.e., fatigue, weight loss despite good appetite, and irritability) may delay the recognition of thyrotoxicosis. Furthermore, in patients with poor glycemic control or other illnesses complicating diabetes, modest hyperthyroxinemia (serum T4 12-14 μg/dl) may be present. At the other end of the spectrum, hypothyroidism may be mistakenly diagnosed in patients with advanced diabetic nephropathy who may have fatigue, pallor, edema, and weight gain suggesting thyroid hormone deficiency. Matters may be confused further by the low serum thyroxine concentration that typically accompanies chronic renal failure. Indeed, diabetes itself or other secondary systemic complications may cause all of the typical constellation of changes in thyroid function tests that occur in patients with nonthyroidal illnesses: a low serum T3 due to impaired extrathyroidal T4-to-T3 conversion, a low serum T4 due to impaired T4-plasma

Table 2. Potential side effects of beta-blockers in patients with diabetes

- Impaired glucose intolerance in noninsulin-dependent diabetes mellitus
- Blunted perception of hypoglycemia
- Delayed recovery from hypoglycemia
- Hyperkalemia with co-existing hyporeninemic hypoaldosteronism

protein binding, and an inappropriately low serum TSH concentration.

In practice, physicians must maintain a high index of suspicion for thyroid dysfunction in patients with diabetes. The serum TSH measurement in a highly sensitive immunoassay (i.e., one with a detection limit less than 0.1 mU/L) is generally the most reliable single screening test for thyroid disease in patients with diabetes. All common forms of hypothyroidism and hyperthyroidism can be detected with this test. In addition, patients with subclinical hypothyroidism and hyperthyroidism, who have serum T4 and T3 concentrations within the normal range, can only be diagnosed with this approach.

There are certain special considerations in the treatment of thyroid disease in patients with co-existing diabetes. Beta-adrenergic blocking agents, which are often used for symptomatic relief in the management of hyperthyroidism, have certain potential side effects in the patient with diabetes (**Table 2**). In general, it is desirable to pursue a definitive cure of hyperthyroidism due to Graves' disease or a toxic nodular goiter with radioactive iodine therapy.

When treating hypothyroidism in a patient with diabetes, the physician should remember the potential for silent underlying coronary artery disease that might be exacerbated by thyroid hormone replacement. Diabetes and associated hypertension and hyperlipidemia are, of course, potent risk factors for atherosclerosis. The introduction of L-thyroxine replacement may, in a small minority of patients, worsen angina or even provoke myocardial infarction due to the increase in heart rate and myocardial contractility affected by thyroid hormones. Consequently, it is best to "start low and go slow" in this setting—prescribing an initial 0.025 mg per day dose and increasing it at monthly intervals in 0.025 mg increments while monitoring the patient's clinical status and serum TSH concentration.

WORD ROUNDS

Bart Gershen, M.D.

Rose red and Prussian blue

Botanists have gathered an assortment of ornamental plants and consigned them to the order of Roses (Rosales). Among them are flowering cherries, mountain ash, hawthorn, roses, and spirea.

The family Spirea contains over 100 shrubs indigenous to the temperate zone. The leaves of one of them, Spirea Ulmaria, yields an extract which has an unpleasant, tart flavor. Researchers for the Bayer company in Germany named it *spiroylige saure*. In the late 19th century, they discovered its principal ingredient was **salicylic acid**.

In 1899, Felix Hoffman and Hermann Dreser produced an acetylated derivative of **salicylic acid** from coal tar. They found it was analgesic (Greek *an* 'without' + *algesis* 'sense of pain') and antipyretic (Greek *anti* 'against' + *pyretos* 'fever'). Searching for an appropriate name for this product, they borrowed an "**A**" from acetyl, "**spir**" from *spiroylige saure*, and terminated the word with "**in**." They named it **aspirin**. The Bayer Corporation began marketing the stuff in 1905, and it soon became the world's largest selling over-the-counter remedy.

Shortly thereafter, the Bayer Company was purchased by the huge German cartel, I.G. Farben Industries, which established an American subsidiary. After World War I, however, the American Bayer Company was condemned as spoils of war. It was then sold to the Sterling Drug Company of New York City, which continues to market Bayer Aspirin to this day.

The Sterling Drug Company is also noted for its manufacture of D-Con, a mouse and rat poison containing **warfarin**. **Warfarin** is the proprietary name for **coumarin**, an anticoagulant that depresses clotting factors II, VII, IX, and X by interfering with gamma carboxylation of precursor proteins. **Coumarin** is found in the tonka bean, a fragrant, almond-shaped bean used in many perfumes and obtained from several leguminous trees of South America. The Tupi Indians of Brazil call the tonka bean *cumuru*, from which their Portuguese conquerors derived *coumarou*—and thus **coumarin**.

In 1924, a hemorrhagic disorder was reported in cattle that had ingested spoiled sweet clover. Investigation revealed that bishydroxy**coumarin**—or **dicumarol**—was responsible. In 1948, Karl Paul Link, a biochemist at the University of Wisconsin, synthesized **coumarin**, a more potent congener. He secured a patent on the drug and named it **warfarin**, an acronym for the **W**isconsin **A**lumni **R**esearch **F**oundation plus coum**arin**.

The age of anticoagulants had dawned for man—and rats.

The I.G. Farben Company of Germany is distinguished for other accomplishments. Its name derives from *Interessen Gemeinschaft **Farben**industrie Aktiengeselschaft*—Community of Interests of Dye Industries, Incorporated. One of the world's largest syndicates, it has embraced more than just dye and chemical enterprises. At one time, it controlled more than 500 companies in 92 countries and was a signatory to over 2,000 cartel agreements. During World War II, Farben controlled

over 900 chemical factories in Germany. It supplied 85 percent of the explosives and virtually all of the tires used by the Nazi army—presenting Hitler's government with a yearly bill for over one billion dollars. (**Nazi**: an acronym for *Nationalsozialistiche Deutsche Arbeitpartei*—the National Socialist German Workers' Party.)

There was another, less well-known, aspect to I.G. Farben's diverse operations. They developed a gas called **Zyklon-B**.

The chemical technique required to produce the gas was actually old and quite well known. It had been developed much earlier in Prussia. There, in 1704, a stunning blue chemical pigment was first produced. The world called it **Prussian blue**, and it continues to be one of the major tints used in the dye and printing industries today.

Prussian blue is ferric ferrocyanide. Using a similar production method, I.G. Farben patented a process for manufacturing solid crystals of hydrogen cyanide. They called this product **Zyklon-B**. It was extensively used as a rodenticide and pesticide. Hitler considered that an appropriate irony. It became the decisive instrument for his *endlosung*—the Final Solution.

Between 1941 and 1945, the Nazis undertook a massive, systematic, state-sponsored effort to kill every Jew in Germany and within the German-occupied territories. The program was run by the **SS** under the direction of Heinrich Himmler, Reinhard Heydrich, and Adolph Eichmann. (**SS**: abbreviation for *schutzstaffel*. These men were Hitler's black-shirted guards. The term means "protective ranks." They were distinct from the **Gestapo**, which was the secret state police—an acronym derived from *Geheime Staatspolizei*.)

Seven concentration camps were chosen to conduct methodical genocide: Auschwitz-Birkenau, Treblinka, Belzec, Sobibor, Chelmno, and Stutthof. The method was quite precise. Prisoners were led to *brausebader*—showerbaths. They were stripped naked and escorted into a communal chamber. The doors were then closed and bolted from the outside.

Next, amethyst-blue crystals of **Zyklon-B** were dumped into the air shaft. Almost immediately, hydrogen cyanide (HCN) gas was released by sublimation. **Prussic acid**, as it had been formerly called, drifted into the closed room. (**Prussic acid**, the original term for HCN, was originally obtained from **Prussian blue**.) At a lethal dose of one milligram per kilogram, death comes quickly. The trivalent iron within cytochrome oxidase binds tightly to the cyanide ion. Intracellular oxidation is completely incapacitated. A few grand mal seizures are soon followed by apnea and death.

The arterialized venous blood often gave the dead a grotesquely robust facial color, as they were dumped into mass graves.

After the war, 24 I.G. Farben executives, who had knowingly participated in these obscenities, were charged with enslavement and mass murder of foreign workers. Their trial represented the first such indictment of business executives in history. Because of mounting anxiety that destruction of Farben Industries might worsen Germany's post-war economy, the case was allowed to lapse. The executives were released.

On December 9, 1946, 23 Nazi doctors were brought before American Military Tribunal Number 1 in Nuremberg. They were charged with war crimes and crimes against humanity. Among them were university professors, the chief administrative (medical) officer of the Reich Chancellery, chief of medical services for the armed forces, chief of the institute for military research, and Hitler's personal physician, Karl Brandt. Seven physicians were executed, five received life terms.

Physicians, it seems, are really not much different from other citizens. We are heroes or villains—or both—depending on your perspective.

Let me illustrate. There were two men whose names I'm certain you remember. One was a Frenchman named Jules, the other a German named Hans. They were contemporaries during the Second World War.

Hans was born in Leipzig, where he received his medical degree. After post-graduate training in bacteriology in Paris and London, he became a lecturer at the Institute of Hygiene in Konigsberg. For a while, he worked directly with August Paul von **Wasserman**, famous for having developed the test that bears his name.

In 1914, Hans discovered the leptospiral organism that causes **Weil's** disease—*L. icterohaemorrhagicae*. (H. Adolph **Weil**, 1848-1916, described the clinical manifestations of the disease in *Deitscjes arcjov für Klinische medizin* 1886; 39:209–32. Today, we refer to it simply as **leptospirosis**.)

During World War I, Hans was stationed on the Balkan front with the First Hungarian Army. There he observed a unique disorder in a young lieutenant, which he soon reported in *Deutsche Medizinische Wochenschrift* 1916; 42:1535–36. He referred to it as spirochetal arthritis.

Hans was mesmerized by Adolph Hitler. In 1932, he signed an oath of allegiance and became a member of the Nazi party. He received several appointments to Hitler's government and was

finally chosen to be the director of the Health Department for the State of Mecklenburg.

Following the Allied victory in 1945, he was briefly imprisoned in an American prisoner-of-war (POW) camp. When it was ascertained that he had not been associated with the Nazi extermination camps or any of the human experiments, he was released. In 1969, at age 88, Hans died peacefully at his country home in Hesse.

Jules, on the other hand, was a fifth-generation physician born in Rouen, France, where his father had been professor of anatomy. After medical school, he began postgraduate work in neurology, studying with **Landouzy** and **Dejerine**. (In 1884, Louis Theophile Joseph **Landouzy** and Joseph **Dejerine** described the facio-scapulo-humeral form of progressive muscular dystrophy known by their mutual eponym.) Several years later, Jules became chief of the clinic and chief of the laboratory at the famous Saltpetriere Hospital. In 1922, he was first to describe a pheochromocytoma of the adrenal medulla.

During World War II, he became active in the French underground. He and his son Jacques rescued and concealed Allied fliers, then smuggled them across the border to Spain and freedom.

One night Jacques did not return home. The following day, the SS arrested Jules, his wife, and his youngest son. After three months in prison, the three were released on insufficient evidence.

Jacques, however, had been taken to concentration camp Dora (Mittlebau), where he was tortured and executed.

Jules never quite recovered from the loss of his courageous son. In 1952, after several transient ischemic attacks (TIAs), he died of congestive cardiac failure.

You may recall that **Jules Tinel** described two signs identified with his name. One is distal tingling on percussion over sectioned nerves, indicating regeneration. The second, percussion over the carpal tunnel with resultant tingling in the distribution of the median nerve, in patients with the carpal tunnel syndrome. Each is referred to as **Tinel's sign**.

And **Hans Reiter** described the urethritis, arthritis, and conjunctivitis of the syndrome bearing his eponym—**Reiter's syndrome**. He is also known for the **Reiter complement fixation test** for syphilis.

Two respected physicians on two sides of a geographic border. On two sides of a military contest. On two sides of a moral issue.

It appears that principles are not always black or white.

Or rose red and Prussian blue. ■

Consultation, a weekly radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on WBAL to discuss the lastest developments in medicine and to answer questions about health issues. Med Chi currently airs the following program of Consultation weekly:

Sunday Morning Consultation
A half-hour program
Interview format: one-on-one talk with John Stupak
Pretaped Wednesday evenings from 7:30 p.m. - 8:00 p.m.
Play back is on WBAL-AM radio Sunday mornings at 9:30 a.m.

To speak out, fill in the form below.

Speak Out on Consultation

When the Doctor is Out

Andrew E. Mance, M.D.—Poet

"The best thing about being a physician is having a life of service to my fellow man, a most interesting species."

Dr. Andrew Mance appeared in person just as he looks in the frontispiece photograph in his book of verse, *Thoughts of a Country Doctor, an Immigrant's Son in Poetry.* He rose to greet me in the lobby of Sacred Heart Hospital in Cumberland, and we found a quiet corner in the hospital library to discuss how his 54-year medical practice inspired him to write three volumes of verse.

He began with a story from early in his medical career to illustrate his philosophy of practice. "Medicine, as my mother taught me, was based on the principle that people need me. One night when I had office hours, my waiting room was full, and people were still coming in at 9:30. Back then, some people would go to the movies and then come into the office after the movies at 11 o'clock; I wouldn't finish till 2:30 in the morning. So on this night, my two secretaries were fussing at me, saying why don't we lock the door. I locked the door. Well, my mother found out; the next day, she came to my office. She said, 'You! Do you remember how hard we worked in order to get you through school so that you could help people? So now you're going to lock the door so people can't see you!' That was all she needed to say."

Figure 1.
Dr. Mance examining a child in 1939 during his internship at Chester Hospital in Chester, Pennsylvania. He earned $2 per week as a medical student and $15 per week as an intern.

He summarized his philosophy in these words: "Real medicine is exactly where it was years ago. In real medicine, you think of the patient. You think of yourself as a servant. If you are a good servant, you get paid." The 78-year-old general practitioner from Oakland has drawn inspiration for his poetry from his long experience as a good servant in medicine.

Dr. Mance expressed some doubt that what he writes is actually poetry. He started writing when an office nurse told him that he should write down the wise and original sayings that he often shared with his staff. She called them "profundities." Dr. Mance protested that he did not think he had said anything profound; he thought his expressions were plain common sense.

When he decided to act on the nurse's advice, he discovered that by the time he had time to write it down, he could not remember what he had said exactly as he had said it. So, he began to keep an index card handy in his shirt pocket for when inspiration hit. Since then, he has filled 10 or 12 notebooks with his common sense sayings, his apothegms.

How the notebooks full of apothegms evolved into verse was another story. One day, when his eldest daughter "gave him some grief about something," he wrote down in one of his notebooks what he was thinking. He looked at what he had written and thought, "I can make a poem out of this." In "Potter's Wheel," his first poem, he described the frustration of a potter struggling with clay that has a mind of its own, much as a father struggles with his daughter. Despite the potter's repeated effort to

mold the clay, to work out its imperfections, it becomes what it wants to become.

Potter's Wheel

Lovingly, J caress
Knead
Mold
Pat and
Press
That piece of clay
Place it on the potter's wheel
Work the treadle
Slowly
Then with more vigor
To shape
Into what J deem
A beautiful chalice
A vase
A bowl
A cup.

It flows
Slowly
But surely
Into another shape
J take it
Knead
Smack it;
Again,
To shape it.
The wheel slowly turns
Now more rapidly
Water J add
To smooth
A rough spot here
Another there,
Gently.

From fatigue
My foot is aching
But J turn on
Adding
Subtracting
A work of art
J plan
The proper shape
The proper sheen
To get that fine finish
That beauty
That perfection.

J turn around
To find
That beautiful cup
Refuses to be
A cup
That beautiful vase
Has changed its shape.
The clay flows,
To my like or dislike,
A life its own
It wants to be
A pitcher.

My foot on the treadle
Weary
The hands blistered
Better than anyone
The imperfections
J see.

The fire of life
Has fixed
The clay
Proud of the pitcher
Yet wonder J
How much more beautiful
Might
The chalice
Have been.

From *Thoughts of a Country Doctor, an Immigrant's Son in Poetry,* Volume 1

"That is where the poetry started, such as it is," Dr. Mance concluded. "I decided prose uses a lot of words, and after awhile people get tired of reading it. I thought if I put down the least amount of words to get my thought across, I could build it into a poem, and maybe someone will read it." With that in mind, the lean, clean form, the few

Figure 2.
Dr. Mance stands in front of his first office--a converted restaurant.

Figure 3
Dr. Mance entered the service as a first lieutenant at Fort Meade, Maryland. He was promoted to captain and, ultimately, to major.

words in short lines that characterize all his poems evolved.

"When I forget to think of each person as an individual—I am in Trouble—People are not patterns"
"Empathy—The beginning of understanding"

From *Thoughts of a Country Doctor*

Figure 4
As Eleanor Callis looks on, Dr. Mance holds Andrew Clark, the last of approximately 2,000 babies he delivered at the hospital or at home.

Dr. Mance declared that his specialty has always been people. He could never look at a patient as a cold or a sore toe. He looked at the entire patient.

"When a patient comes to me, I begin to evaluate that person immediately. I see how he walks, how he appears, how he is dressed. I need to know his religious affiliation. I need to know the financial condition. I need to know all this, but it isn't that I am going to treat him any differently. I treat to the best of my ability."

Dr. Mance observed that he is now in the sunset of his practice, but he still sees 40 to 50 patients in a four-day week. Most of his current patients are old friends. He reminisced about past times in his practice, which he opened in 1939. Oakland, the county seat of Garrett County on the western-most edge of Maryland, had four other doctors at that time, and one of these told him there was no room for a fifth. About 24 physicians practice in the town now, he observed, and Oakland has room for all of them.

Just 16 months after beginning his practice, he built his own office building, but only a few months later, in April 1941, the army reserve called him into service. Fifty-four months later, on November 5, 1945, he reopened his office at the end of World War II; his waiting room filled with as many patients as he had on the day he had left.

"I hope I never retire—I can't imagine being without work"
"Sleep in a hurry"

From *Thoughts of a Country Doctor*

"The least amount of time I spent between people was the best," Dr. Mance stated. "I could run from patient to patient, but when I sat down with a patient, it was different. Then I had time. In my office, each patient got 10 to 15 minutes of my undivided attention."

He recalled often having an office full of patients, as many as 20 people sitting in his waiting room, causing waits as long as an hour and a half. He remembered the patient who came in one time and said, "The last time I was here I was sick, and I had to wait. I'm better now. I don't have to wait this time." So he went back home. He also remembered the three ladies who came prepared with their knitting for a long wait. As they knitted and chatted on that warm spring day, another patient, "one of these country boys still wearing three heavy shirts for wintertime, came out of the office." One of the ladies looked up and said, "Gee, he's been here since last winter."

In his prime, Dr. Mance saw from 60 to 70 patients in a day. "You say I couldn't do it?" he challenged, "I couldn't if I only worked an eight-hour day. But if I figured the minimum of time I could give a patient was 10 minutes, I would see five to six patients in an hour. If I saw 70 patients, that figures out to a lot of hours. I remember day

after day, week after week, month after month, working 20-hour days or even longer. I remember working 24 hours straight, right into the next day, but that was not often; that was a rare occasion. But it was nothing to work 16, 18, 20 hours a day, and that was six days a week. I used to make as many as 10, 12, 15 house calls. I remember one time delivering three babies on one circuit, and I remember almost meeting myself out in the county from where I started to where I ended up. It's been fun in the sense that I learned to work as a youth," Dr. Mance observed, "and I cannot imagine wasting time."

"Poverty when tempered with honesty creates vision"
"My father and mother left me stepping stones so that I may walk in the present with my feet more dry...."

From *Thoughts of a Country Doctor*

Dr. Mance thought back to his boyhood to describe his parents, Croatian immigrants, who gave him his strong work ethic. Having no more than grade school educations themselves, they strove to provide him with an education.

His father worked in the coal mines of western Pennsylvania for about 20 years before he went into sawmilling. "I worked in my father's sawmill beginning at age 11, firing the steam boiler. At age 12, I drove a team of horses logging in the woods, and I worked every summer vacation at the sawmill until my last year in school. We worked 10 hours a day in all weather." "My father was a brilliant man," Dr. Mance stated. "I am but little, if at all, smarter; see what he did with so very little and how little I do with so-so much."

Dr. Mance described his mother as "illiterate but brilliant in many ways." "Mother kept boarders practically all her life. Around 1908, she had 32 boarders plus my father, my brother, and herself. It was nothing to have 6, 8, or 10 boarders, people who worked in the mines or at the sawmill. She took care of them all, feeding them and doing their laundry. When we got another boarder, we built on additional rooms if necessary. We didn't have the amenities, but we had food."

Figure 5
Dr. Mance in his living room, holding his writing board, which he moves from place to place.

Another story came to mind. "During the Depression in 1932, when I came home after graduating from high school, my parents looked gaunt. We had fat back (three inches fat and a quarter inch lean), cornmeal, barley, and potatoes. We were managing. A man came down the road one day and called out to my father, 'Hey Mr. Mance, they're giving out canned foods and hams down at the Stony River bridge for people who don't have food.' My father said, 'We have food. That's for people who don't have food.' That tells what kind of background I came from," Dr. Mance concluded.

He credited his father as the source of the Croatian folk tales that he has preserved in the collection of poems, "Tales by Lamplight," in *Thoughts of a Country Doctor, An Immigrant's Son in Poetry*, Volume II. As a boy, his father heard the stories from his father, who heard them from his father, and so on back for many generations. Some of these folk tales Dr. Mance related to experiences in his medical practice. In

"The Pear Tree," an ancient farmer forestalls Death by tricking him into climbing his unusual pear tree. Once in the tree, Death could not climb down without the farmer's consent. No one could die, resulting in hardship and agony for humankind. Dr. Mance related this story to circumstances he often sees in nursing homes and with patients suffering from terminal conditions; modern medicine sometimes tries to keep Death in the pear tree.

At the close of our interview, Dr. Mance pondered what he would like to accomplish through his writing. He hopes to help his audience, mostly his patients, his family and friends, to stop and reflect, and perhaps even learn from his poetry. By saying much in few words, he tries to leave room for his reader to think. He would like to leave for future generations some of his thoughts, some evidence that he lived.

His poem, "Worth," summarizes well this gentle physician-poet's attitude and demeanor.

Worth

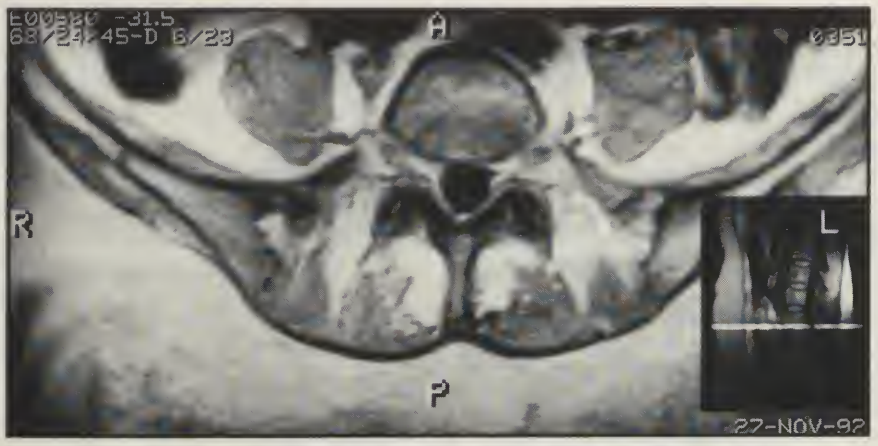
Beware of praise,
Lest it turn your head,
Lead you to stumble and fall.
Know your own worth,
Use it to your fullest —
In humility —
For yourself and
Your fellow man.

From *Thoughts of a Country Doctor, an Immigrant's Son in Poetry,* Volume 1

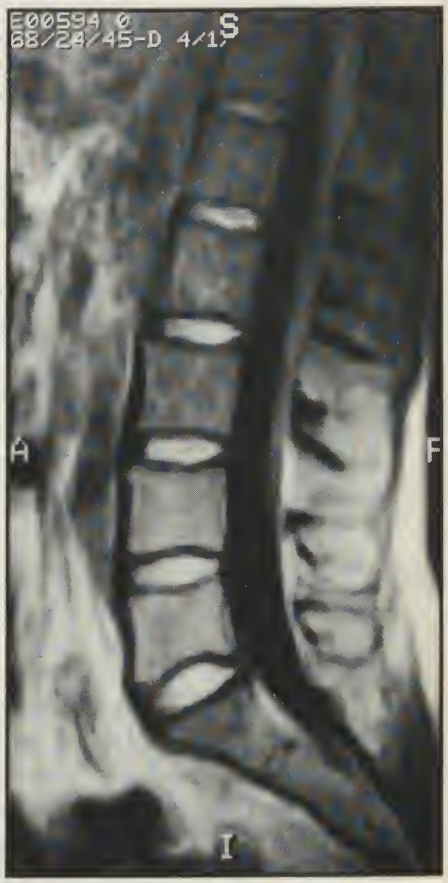
CORA TETER, M.S.
Ms. Teter is project coordinator of Focused Professional Education at Med Chi. ■

When the Doctor is Out

This column focuses on Med Chi members who, in addition to practicing medicine, have novel hobbies, unconventional interests, or other occupations. If you fit in this category or know of a colleague whom we should feature, please contact Janet Campbell at 410-539-0872 or 1-800-492-1056.



Two Reasons Why You Should Refer Your Patients To Accessible MRI:



1. A Medical Test Should **NOT** Scare People Half to Death!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 450 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At Accessible MRI we make it easier for you to diagnose your patient's problems.

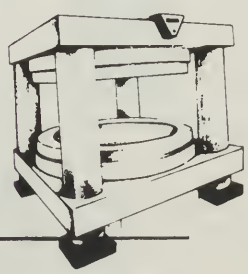
T-1 Axial MRI image through the L-5 S-1 disc level. Notice the sagital insert showing exactly where this slice is taken.

T-1 Midline Sagital Lumbar Spine MRI of a normal spine.

2. Our Images Speak for Themselves

You don't have to compromise the quality of your images for the comfort of your patients. At Accessible MRI, your images receive the highest quality and latest state-of-the-art technology.

Our Board certified radiologists have read over 11,000 scans and are available for consultation at any time. Our professional, highly-trained staff provides the expertise and experience you demand. We are able to handle all your patients' schedule needs at either our Baltimore or Washington location.



We provide quick turnaround on all films and transcriptions. We participate with most insurance plans. Please contact our representative for further information.

Book Reviews

The Heart of a Child. What Families Need to Know about Heart Disorders in Children. Catherine A. Neill, Eugene B. Clark, and Carleen Clark. Baltimore: The Johns Hopkins University Press. 1992. 331 pages. $24.95

In 1676, Isaac Newton wrote John Hooke: "If I have seen further, it is by standing on the shoulders of giants." In the presentation of this book, the authors also stand on their predecessors with their multitude of contributions in this exciting field.

The past 50 years have witnessed the creation of a new branch of medical specialization – pediatric cardiology and related surgery. Society still thinks that heart attacks occur only in the older population and does not know that about 8 of every 1,000 children have congenital heart defects (25,000 per year in the United States). During childhood, 2 in 1,000 will acquire a new problem producing a myopathy, valvular disorder, or serious conduction disturbance.

The prime desire of current pediatric cardiologists is the provision of the best possible therapy for the affected child, so that the disordered heart may function well. Because many of the difficulties surrounding intracardiac surgery have been circumvented, the authors can present an excellent game plan to treat affected children.

In this book, written for anxious parents whose children have one or a combination of birth abnormalities, the authors state *"cor ad cor loquitur"* – the heart speaks to the heart. Their comments and advice are consistent with the quotation.

The book has been prepared with a complete grasp of cardiac medicine and pathology. Numerous simple but explicit illustrations help tremendously in an analysis of the problem of immediate concern. An old Chinese proverb reads: "One picture is worth more than ten thousand words." Although the material, at first glance, would seem to be beyond the ken of most lay people, the concurrent explanations of the health care team members involved help to bridge this difficulty.

After reviewing the embryologic formation of the normal heart and how it works, the authors guide the parents into an analysis of the risk factors that may cause the heart to be abnormal. The factors may be of genetic, radiation, virus infection, diabetes mellitus, chemical, medication, alcohol, or "hard" drug origin. These determinants may be discussed in retrospective or prospective fashion.

Cardiac medicine and surgery have made tremendous strides since the patent ductus arteriosus was first tied by Robert Gross and Clarence Craaford. The invention of the heart-lung machine for cardiopulmonary bypass, ultrasound and magnetic resonance imaging (MRI) for more precise viewing, and catheterization for greater definition of the defects have each added quantum jumps to diagnosis methods. Just prior to these developments, thoracic surgeons were only just learning how to operate in the thoracic cavity safely.

For ease in orientation, the book divides all cardiac defects into categories:

- Not requiring treatment, such as innocent murmurs and benign mitral prolapse
- Needing emergency surgery after birth, such as cyanotic heart defects
- Requiring treatment with medications or catheterization, but not surgery
- Treated surgically in infancy or childhood as coarctation of the aorta, patent ductus arteriosus, atrial septal defect, ventricular septal defect, aortic valve stenosis, or tetralogy of Fallot

A short case report about each of the many defects provides easy reading for

parents who may, with proper help, visualize the difficulty their child has. The book also attempts to care for the day-to-day needs of the parents as they await the outcome of their child's operation.

Treatment, of course, does not stop when the operation is completed, as these children need prolonged follow-up. Indeed, the efforts of the health team are required more than ever if the treatment fails or does not produce a completely favorable result. The results of therapy today are most encouraging, for in the late 1930s, only a few people with the tetralogy of Fallot reached middle age. Now there are hundreds or perhaps thousands.

Despite the successes, death still occurs in these children, with the most hazardous period being in the first year, particularly the first month. When the death of such a child occurs, parents often feel abandoned in their grief. The book suggests that the health care team may alleviate the mental trauma by attending the funeral, remaining available if new questions arise, and keeping a member of the support group accessible. Grieving is long, slow, and exhausting. For some parents, help may also be available from community support groups; sharing sadness can be a form of holistic healing.

The book states that although children should not be overloaded with complex information, they should know the name of their exact defect and know that a follow-up examination, like automobile maintenance, is needed periodically. Here again, the health care team may be of unqualified assistance.

After their consideration of damaged hearts, the authors conclude with suggestions to maintain a healthy heart. This problem actually is of far greater significance than the correction of mechanical defects. Eliminating the malignant effects of smoking, eating a proper diet, and having blood pressure measured annually are facets in keeping the heart healthy. Family, teachers, and school nurses may be part of an effective cardiology prevention team.

All cardiac abnormalities begin in childhood, many before birth, although they may not be recognized until adulthood. Coronary artery disease occasions the loss of 8 to 10 times more productive years of life than congenital heart defects. Any protective effort exerted in the early years should prove most beneficial later.

The Heart of a Child is an excellent medical book because it provides a reference to a specific defect for interested parents. A much greater audience will be presented by medical students and medical practitioners who are not cardiologists. In addition, all public libraries should add it to their collection of medical books. Truly, this book about hearts is written in a heart-to-heart manner.

Planning for a Healthy Baby. A Guide to Genetic and Environmental Risks. Richard M. Goodman. New York: Oxford University Press. 1986. 169 pages. $16.95

With this book, Goodman, an internationally known geneticist, makes a significant contribution to perinatology, a branch of medicine now experiencing vigorous growth. In a question-and-answer format, he presents specific information about the leading problems associated with pregnancy.

Many of the diseases of childhood that previously entailed a considerable mortality have now been abolished or markedly ameliorated. Until recently, however, the field of genetic errors remained relatively untouched. Now, medications, drugs, smoking, alcohol, and age are being explored as etiologic agents for untoward fetal changes.

The author believes that all couples should plan for a pregnancy before the fact and seek medical advice, particularly if a familial problem has appeared previously; anyone may be the parent of an abnormal child. Over 3,000 human genetic disorders have been recognized and cataloged. The collected statistics emphasize why increasing attention must be given to the preventive aspects of obstetrics and pediatrics. In the United States, 1 in every 100 pregnancies is associated with a disorder of the single-gene type, and 1 in 160 fetuses has a chromosomal abnormality.

The author presents in-depth information about the most common birth defects. The subjects of environmental and genetic factors, maternal illness, diagnostic and therapeutic procedures, and ethical issues are considered in detail, with particular attention being given to chromosomal abnormalities. The effects of increased parental age, nondisjunction, exposure to radiation and infection, and inherent structural defects are reviewed. Specific regard is given to Down's syndrome, cystic fibrosis, phenylketonuria, muscular dystrophy, hemophilia, sickle cell disease, and Tay-Sachs disease.

New examinations devised during the last 20 years help decipher some of the puzzles of pregnancy. Ultrasound, which avoids the use of x-ray, has offered a tremendous aid in imaging the fetus. The modus operandi and measurement of alphafetoprotein have been helpful in the diagnosis of neurologic defects. Amniocentesis and chorionic villus sampling are further examples of perinatal investigational technology.

Pearls of knowledge are plentiful. Two are related for illustration.

1. Neural tube defects occur in 1-2 per 1,000 newborns in the United States. Specific causes for the appearance of these defects are unknown, but strong suspicion exists that certain environmental factors, a folic acid

deficiency, or some anticonvulsant drugs may be involved. If the malformation has been present in the family previously, the risk is between 1:20 and 1:200, depending on the nearness of the kin involved. At the moment, such defects may be recognized prenatally by determination of alphafetoprotein in the amnionic fluid at a specific period (15 to 18 weeks of gestation) in the maternal blood serum. An elevation should lead to an ultrasound examination for confirmation.

2. Estimated rates of having a child with Down's syndrome rise remarkably with maternal age. At age 20, the risk is 1:365, but at 40, it is 1:12. This rate carries a distinct warning to older people who contemplate having a child.

The contents of the book are drawn from the personal experiences of a specialist in clinical genetics. The publication concludes with a check list of factors that may influence fetal growth, a suggestion for basic examinations in planning for a child, addresses from which additional information may be obtained, selected book references, a glossary of medical terms, and a good index.

Ostensibly written for actual or prospective parents, the book will find greater use by medical students and general practitioners. Individual couples will only be interested in a particular segment of this encyclopedic volume. Every medical library should include the volume in its collection.

JOSEPH M. MILLER, M.D.
Timonium, Maryland ■

HEALTH CARE RESEARCH INSTITUTE, INC.

The Health Care Research Institute, Inc., a not-for-profit corporation will accept proposals for research related to the assessment of health care.

The Health Care Research Institute recognizes that the environment in which medicine is practiced has changed and that there is a need for obtaining information or data on how quality medical care can be provided on a cost-effective basis. Funds will be provided for grants in research and for training in such health care issues as the following: Decision analysis; the better understanding, interpretation, and application of clinical trials and their use in reaching appropriate decisions; proper cost-effective interventions in health care; appropriate decision making with regard to elderly patients; health care policy including reimbursement methods and the effect of such reimbursement mechanisms on proper decisions on diagnostic and therapeutic approaches to the care of patients; on approaches to containing the escalation of health care costs; on studies relating to the use of outcome analysis on the evaluation of health care; and on innovative approaches to evaluate the quality of health care.

Examples of areas of potential research include studies related to the assessment of the quality of care, cost-effectiveness of health care decision analysis, and guidelines for appropriate care.

Since the funds are limited, the total support for each grant or fellowship cannot exceed $20,000. No funds can be provided for overhead or for the purchase of capital equipment. Because of the limited funds available, priority will be given to the support of research fellows involved with preliminary innovative studies and to original studies by experienced investigators. Applications will only be accepted from not-for-profit institutions.

Applications are to be submitted by July 1, 1993 for support to begin September 1, 1993. Initial and interim review, and progress reports will be performed by the Board of the Health Care Research Institute which will also be responsible for the selection of all projects to be supported.

Applications are to be mailed to the following address:

HEALTH CARE RESEARCH INSTITUTE, INC.
P. O. BOX 4703
TIMONIUM, MARYLAND 21094

Applications should include the protocols for study, and relevant experience and bibliography of the investigator.

A Look Back

MMJ: 25 years ago

Bart Gershen, M.D.

Dr. Gershen is a cardiologist in Rockville, Maryland.

It was 1968. Lyndon Baines Johnson was in the White House, Spiro Agnew was the honorable governor of our fair state, and Richard D. Bauer, M.D. was president of the Med Chi Faculty.

It was the year of the Tet offensive, the capture of an American ship named Pueblo, and the finale of a small Vietnamese village called My Lai.

On March 31, Lyndon Johnson stunned the nation by announcing his decision not to run again for the presidency. Four days later, Martin Luther King, Jr. was shot to death in Memphis, and three months later, Robert Kennedy was killed in Los Angeles.

The Apollo VIII astronauts became the first men to orbit our moon. On Christmas Eve, they read from the book of Genesis and sent their prayers for peace to an earth staggered by these maniacal circumstances.

That year, the *MMJ* carried advertisements for Thorazine (chlorpromazine) to prevent senile anxiety, Vistaril (hydroxyzine pamoate) for alcoholism, Tuinal (sodium secobarbital) for sleep, Geroniazol TT (pentylenetetrazol and niacin) for geriatric patients, Bamadex Sequels (dextro-amphetamine sulfate) for appetite control, TAO (troleandomycin) for respiratory infections, Solfoton (phenobarbital and bensulfoid) for sedation, BSP disposable units (sulfobromophthalein sodium) for liver function studies, Tybatran (tybamate) for tranquilization, Mellaril (thioridazine) for the agitated business executive, and deserpidine and pargyline for the hypertensive patient.

A psychiatric text, *The Neuroses*, was published that year by Henry Laughlin, M.D. and received a favorable review in the *Maryland State Medical Journal.*

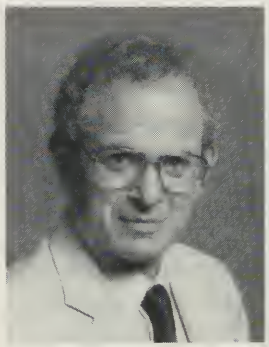
The Council voted to support legislation that would remove abortions from the Maryland criminal code, declared the use of bank credit cards for medical payment to be unethical, and voted a maximum of $2,000 for actuarial assistance to be used—if needed—in discussion with the state legislators.

The annual Med Chi meeting was held at the Sheraton-Belvedere Hotel in Baltimore. The rates were $17.50 for a twin-bedded room per night. Suites were $40.00.

Among the featured speakers was the famous cardiovascular surgeon Arthur M. Vineberg of Montreal who detailed his innovative, world famous technique for correcting coronary artery disease—the Vineberg procedure.

1968 was also the year Queen Elizabeth II bestowed the Order of the Garter upon her eldest son Prince Charles. It was also the year of Paul Simon's famous "Mrs. Robinson."

How appropriate. ■



Members in the News

BRUCE W. BERGER, M.D. has been re-elected vice president of Sinai Hospital's medical staff. Dr. Berger, a urologist, is a former president of the medical staff and has participated on many medical committees managing the health care of patients. He is an assistant professor of surgery in urology at the University of Maryland Hospital, and has authored numerous papers and presentations.

GERARD A. GARGUILO, M.D. has been elected chairperson of the Medical Executive Committee (MEC) of Sinai Hospital. MEC comprises departmental chiefs and attending physicians whose subcommittees oversee every phase of patient care at the hospital. Dr. Garguilo, a surgeon, was on the MEC President's Advisory Committee last year, advising on policy issues requiring discussion with the hospital administrators. With a keen interest in severe injury, Dr. Garguilo served as director of the Trauma Service, and chaired the hospital trauma and disaster committees. The latter group closely supervises the efficiency of medical and support teams responding to major accidents in Sinai's region. Dr. Garguilo was assistant surgeon-in-chief until last year, when he went into private practice. He specializes in breast disease and breast cancer surgery. He is a clinical instructor in surgery at Johns Hopkins University School of Medicine, and a fellow of the American College of Surgeons.

GERALD A. HOFKIN, M.D. has been re-elected president of the medical staff at Sinai Hospital. In this capacity, Dr. Hofkin represents almost 1,000 physicians when conferring with the hospital administrators and the board of directors. A gastroenterologist, Dr. Hofkin has been associated with Sinai since 1963, when he served part of his residency. He has served Sinai and the medical staff in many volunteer capacities. He is an assistant professor of medicine at Johns Hopkins University School of Medicine, and clinical assistant professor of medicine at University of Maryland Hospital. He is a diplomate of the American Board of Internal Medicine, and fellow of the American College of Gastroenterology and American College of Physicians. He instructs medical residents in gastroenterology at Sinai.

MELVIN L. KELLER, M.D. has been re-elected to serve his second year as vice chairperson of the Sinai Hospital Medical Executive Committee (MEC), which oversees all phases of patient care at the hospital. Dr. Keller has been anesthesiologist-in-chief at Sinai since 1976, and is medical director of the intensive care unit and respiratory care division. He is also chairperson of the Cardiopulmonary Resuscitation Committee and serves on the Patient Care Committee. Dr. Keller is a fellow of the American College of Anesthesiologists and diplomate of the American Board of Anesthesiology. He is an assistant professor in anesthesiology/critical care medicine at Johns Hopkins University School of Medicine, and an associate clinical professor of anesthesiology at the University of Maryland School of Medicine. Dr. Keller is one of the earliest members of the Society of Critical Care Medicine. He is a past chairperson of the hospital consultation subcommittee and education committee of the American Lung Association of Maryland.

WILLIAM R. LEAHY, M.D., on a volunteer basis, is instructing a Home Health Aide Program that he developed in cooperation with the Prince George's County Medical Society for students at Bladensburg High School. The first of its kind in the United States, the program prepares students for placement with regional home care agencies. Upon completion of the course, students become eligible to take a state certification exam, which they must pass to obtain employment as home health aides. Dr. Leahy, a practicing neurologist in Maryland for over 15 years, identified a growing need for skilled home health care providers in his community, particularly for Alzheimer's patients. He also saw a critical need for career training for high school students who lacked skills for productive employment. As founder and moderator of the Greenbelt Alzheimer's Support Group, Dr. Leahy has done extensive research on the effects of Alzheimer's disease on the family unit. He recently completed a year and a half of investigative research on effects of a trial medicine on Alzheimer's patients. Dr. Leahy is a fellow of the American Academy of Psychiatry and Neurology and the American Board of Pediatrics. He has also served as the president of the Maryland Neurologic Society. He is an examiner for the American Academy of Psychiatry and Neurology and serves on the professional board of the National Capital Epilepsy Foundation. He is an assistant professor of neurology at Johns Hopkins Hospital and an attending neurologist at Doctors' Community, Greater Laurel-Beltsville, and Washington Adventist hospitals. ■

EASTERN SHORE, MARYLAND:

New hospital opening late Spring of 1993 on Maryland's Eastern Shore, serving a dynamic community on the Atlantic Ocean. We have opportunity for BC/BP, residency trained physicians in Emergency Medicine. Excellent salary and benefit package. Qualified candidates send C.V. to James A. D'Orta, M.D., 199 Lionhead Court, Baltimore, MD 21237. Fax or Tel: (410) 686-2124.

PHYSICIAN PLACEMENT SERVICE

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral Street
Baltimore, MD 21201
410-539-0872
1-800-492-1056

Physicians wishing to locate in Maryland are invited to submit a résumé to be kept on file with the Physician Placement Service. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ **announcements for physician placements in the classifed advertisements are charged at the regular classified advertising rate.**

Auxiliary

Georgia Chaconas Lizas: 1993-1994 auxiliary president

Georgia Chaconas Lizas is taking over the reins as president of the Auxiliary to the Medical and Chirurgical Faculty of Maryland for the 1993-1994 year. It is the first time there has been a state president from Frederick County.

Mrs. Lizas was born and raised in Washington, DC. She received her bachelor of science degree from the University of Maryland. After graduation, she taught secondary school in Prince George's County. She then ran her very successful family business in Washington, DC until she moved to Frederick in 1970. Georgia remains a member of St. Sophia Greek Orthodox Cathedral in Washington.

Her husband, Dr. Peter C. Lizas, a native of Athens, Greece, graduated from the University of Athens Medical School. After serving as a doctor in the Greek army, he spent two years in England completing a residency in orthopaedics. In 1964, he visited his brothers in Washington, DC, and they convinced him to stay. He retrained at the George Washington University, completing a surgical internship and two-year residency in anesthesiology. Since moving to Frederick in 1970, Dr. Lizas has been in private practice, working out of Frederick Memorial Hospital. Dr. Lizas is an active member in the Frederick County Medical Society, where he is currently serving as treasurer.

Dr. and Mrs. Lizas have three children, "plus one." In May 1993, their daughter Rania will receive her masters of public administration degree from the George Washington University. Their son Constantine and daughter Eleni attend Gettysburg College. Constantine, a chemistry major, will also graduate in May. He plans to pursue a graduate degree as well. Eleni starts her junior year this fall; her interests are in archaeology and classical studies. Their "other son" is Angelos Manganiotis, a medical student at the University of Maryland. Angelo has been staying with the Lizas family since 1988 because his family lives in Greece.

Mrs. Lizas has always been a very active community member. A lifetime member of the Frederick Memorial Hospital Auxiliary, she has helped with its Christmas bazaars for years. When her daughters were young, she was a Girl Scout leader of troop 11395 for 10 years. While her children attended St. John Grade School in Frederick and St. Marie Goretti High School in Hagerstown, she volunteered her time in various school projects, including setting up mini-courses to supplement the academic curriculum and organizing sports banquets to honor school athletes. She often visits elderly people in nursing homes and has organized several groups of individuals to also visit the elderly. These activities are just a small sampling of the many positive things Mrs. Lizas has done for her community.

Figure 1. Mrs. Georgia Chaconas Lizas, 1993-1994 auxiliary president

Mrs. Lizas has been active with the Frederick County Medical Society Auxiliary since 1984 when she hosted a coffee hour that led to the formation of the auxiliary. She was one of the charter members and was the first president, serving two years (1985-1987). In 1988-1989, she became second vice president of the Maryland auxiliary. She became first vice president in 1989-1990, state treasurer in 1990-1991, and president-elect in 1992-1993.

The theme for Mrs. Lizas's presidency is "Get Involved!" She hopes the auxiliary can grow and do much more important work than ever before. She also hopes everyone will contribute as much as they are able. It is important to her that many people put in a little effort, rather than having a few people do most of the work.

While president, Mrs. Lizas has several interests she would like to promote. First, she would like to continue the auxiliary's work in raising awareness about breast cancer; the more people the auxiliary can reach, the more lives can be saved. Second, Mrs. Lizas wants to continue the programs aimed at preventing family violence, especially violence against women. Third, she plans to actively address the upcoming legislation concerning health care and doctors. The auxiliary must lobby for legislation that not only protects doctors, but provides the best possible health care for all. Finally, she would like to continue the many programs the auxiliary now sponsors. ■

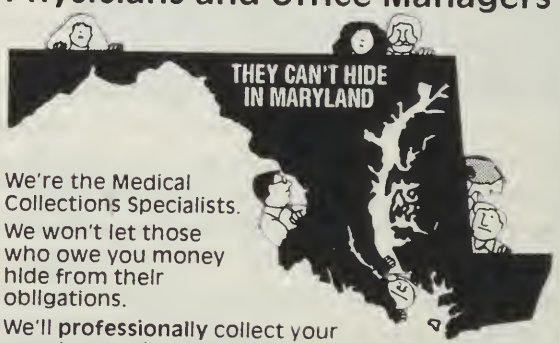
In Memoriam

Anthony Lewandowski, M.D.

ANTHONY LEWANDOWSKI, M.D., a retired physician and Baltimore native, died of pancreatic cancer on February 21 at the age of 63. After graduating from Loyola College and the University of Maryland Medical School in the 1950s, he attained the rank of captain in the Army Medical Corps in Europe. From 1962 until his 1990 retirement, he was in private practice specializing in internal medicine and kidney disease. In the 1970s, he was assistant professor of medicine at the University of Maryland Medical School. He was a staff member of Maryland General, South Baltimore General, St. Joseph, Union Memorial, and University hospitals, and the Greater Baltimore Medical Center. Dr. Lewandowski was also a member of the American College of Physicians and the American Society of Nephrology.

Stephen Mackowiak, M.D.

STEPHEN MACKOWIAK, M.D., a general practitioner, died of Parkinson's disease complications on February 20 at the age of 81. A Baltimore native, Dr. Mackowiak graduated from City College, the University of Maryland Pharmacy School, and the University of Maryland Medical School in the 1930s. During medical school, he worked as a pharmacist. He served his internship and residency at the Emergency Hospital in Washington, DC. He served in the Army Medical Corps during World War II in the Pacific, where he attained the rank of captain and received a Purple Heart. In 1984, Dr. Mackowiak retired from his Dundalk practice after almost 40 years. He was a staff member of South Baltimore General Hospital and former president of the Maryland Academy of Family Physicians.



Albert I. Mendeloff, M.D.

ALBERT I. MENDELOFF, M.D., physician-in-chief at Sinai Hospital from 1955 to 1980, died of leukemia on March 15 at the age of 75. Originally from West Virginia, Dr. Mendeloff graduated from Princeton and Harvard universities. He acted as nutrition consultant to the surgeon general of the army during World War II. In St. Louis, he was an associate professor of medicine and preventive medicine at Washington University and a gastroenterologist at Barnes Hospital. In 1955, Dr. Mendeloff came to Baltimore and became Sinai's first full-time physician-in-chief and full professor of medicine at Johns Hopkins University. Dr. Mendeloff created the biochemistry research laboratory at Sinai in 1958. At Hopkins, he started the division of gastroenterology, serving as its co-director from 1957 to 1970. After his retirement as physician-in-chief in 1980, he headed the Sinai Department of Research Medicine. He also remained a professor at the medical school and senior associate in epidemiology at the Johns Hopkins School of Hygiene and Public Health. He also served as a consultant to the Loch Raven Veterans Hospital and held several posts at the National Institutes of Health. In addition, he served as president of the American Association for Clinical Research and of the American Gastroenterological Association. He served the past 12 years as president of the Shriver Hall Concert Series at Johns Hopkins University.

Gilbert Rudman, M.D.

GILBERT RUDMAN, M.D., 80, died of Parkinson's disease complications on March 7. Born in Baltimore, Dr. Rudman graduated from City College, Johns Hopkins University, and the University of Maryland Medical School. He was a general practitioner in private practice in Baltimore from 1939 until he retired in 1981. He was a staff member of Bon Secours Hospital. He was also a member of the Baltimore City Medical Society. ■

Medical Miscellany

MSMSA holds first annual meeting on nontraditional medicine

On Saturday, February 13, 1993, the Maryland State Medical Student Association (MSMSA) held its first annual meeting. Representatives from the University of Maryland, Uniformed Services University of the Health Sciences, and Johns Hopkins University medical schools attended. Registration activities were conducted by Student Component officers and Council members, who also acted as greeters to all the students who attended.

While registration activities were underway, Med Chi staff escorted student members and guests on a tour of the Med Chi building. Students were shown the various departments within Med Chi and were provided with a brief explanation of department functions.

Figure 1. MSMSA President Susan Boyd and Vice President G. Andrew Clarke listen intently as Brian Berman, M.D. answers students' questions about nontraditional medicine.

A detour up the marble staircase leading to the roof provided students with a tale of the Med Chi ghost, Marsha, who allegedly ambles through the building at night. (Marsha was the name of the Med Chi librarian who lived on the top floor of the Med Chi building, and who probably had one of the very first condominiums in Baltimore.)

With registration activities completed, the educational program began. The theme of this first annual meeting—nontraditional medicine—was chosen because the subject interested many student members.

The first presenter, Brian Berman, M.D., assistant professor of anesthesiology at the University of Maryland, spoke on the "Integration of Traditional and Nontraditional Medicine." Dr. Berman is a family physician who practices acupuncture and homeopathy at the University of Maryland Chronic Pain Center. He is a graduate of the Royal College of Surgeons in Ireland and completed his residency at the University of Maryland. Currently, Dr. Berman is performing research into physicians' attitudes toward nontraditional medicine as part of a large collaborative project between the University of Maryland and the Sir Maurice Laing Foundation of Great Britain. The program mission is to "introduce complementary medicine into academic research, clinical service, and teaching." (Complementary medicine is the term used in Great Britain for treatment options termed nontraditional in the United States, including homeopathy, acupuncture, behavioral medicine, biofeedback, and relaxation techniques.)

In his talk, Dr. Berman explained that while allopathic medicine provides effective treatments for acute pain and acute disease states, many chronic conditions may be more effectively treated with components of complementary medicine. Using pain as an example, he stated that while traditional treatments for acute pain (e.g., high potency narcotics) are effective for short-term pain management, problems of tolerance and dependence limit their effectiveness for chronic pain. At the University of Maryland Chronic Pain Center, a combination of allopathic and complementary treatments are able to alleviate chronic pain in the vast majority of patients—most of whom enter the program having failed several other treatments.

Students questioned Dr. Berman about combining traditional and nontraditional medicine as part of the practitioner's everyday practice. Most students were curious about Dr. Berman's experiences with nontraditional therapies and expressed interest in having Dr. Berman make another presentation to the MSMSA.

After a short recess, which allowed the students to meet Dr. Berman personally, Jerry Toporovsky, Ms.T., director of the Baltimore Holistic Health Center, spoke on "The Bridge Between Alternative and Orthodox Medicine." Mr.

Figure 2. Jerry Toporovsky, Ms.T. presents "The Bridge between Alternative and Orthodox Medicine" at the MSMSA annual meeting.

Toporovsky shared his extensive experience studying alternative medicine worldwide and illustrated some of the theoretical differences between allopathic medicine and, for example, homeopathy. Although such views as reflected in homeopathy—that successive dilutions "potentize" a medicine—seem foreign in western medicine, Mr. Toporovsky emphasized that all of the many successful healers he has known—alternative and traditional—have shared a genuine concern and interest in their patients. This genuine concern for the patient's well-being, Mr. Toporovsky said, is what he believes is the essence of healing.

Mr. Toporovsky's presentation generated questions about holistic medicine and treatments. His extensive knowledge of nontraditional medicine and therapies peaked student interest and stimulated further discussion.

At the conclusion of the educational program, MSMSA officers reported on association activities. Susan Boyd, MSMSA president (University of Maryland), provided the students with an overview of Student Component activities during the last year. She also reported on upcoming initiatives and encouraged students to become active in the Student Component and on Med Chi committees. Robert L. Ferris, MSMSA secretary/treasurer and AMA alternate delegate (Johns Hopkins University), spoke about the AMA initiatives and his activities as AMA alternate delegate. G. Andrew Clarke, MSMSA vice president (Uniformed Services University of the Health Sciences), provided a legislative update for the students.

The brief business meeting was followed by dinner, which included a lively discussion on nontraditional medicine and provided the students with an opportunity to get to know one another. Social activities capped the evening when the entire group left Med Chi and went dancing at Fells Point until fatigue and the specter of upcoming exams sent everyone home.

The first annual meeting was hailed as a success. The three medical schools are anxiously looking forward to the activities for this year and to another interesting annual meeting.

SUSAN J. BOYD, MSII
President, MSMSA ■

Unique opportunity to join premier emergency group newly staffing St. Agnes Hospital, a teaching hospital with 52,000 ED visits; partnership opportunities available; excellent salary and comprehensive benefits. Contact Kevin Scruggs, M.D., Dept. EM, St. Agnes Hospital, 900 Caton Avenue, Baltimore, MD 21229-5299; (410) 368-2012.

WELCOME!

The Medical and Chirurgical Faculty of Maryland welcomes the new members listed below. They join an organization with a 194-year history of dedicated service to improving the health and welfare of the people of Maryland. With the help and expertise of longtime members and the participation and input of new members, Med Chi can continue its proud tradition of ensuring quality health care.

Miscellaneous meetings

Thrombolysis: Its role in peripheral, arterial, and venous disorders, at the Omni International Hotel, Norfolk, Virginia. Info: 804-446-6140. — **Apr. 23**

New trends in gastroenterology and liver disease II, sponsored by the Greater Baltimore Medical Center. 9.5 Cat 1 AMA/PRA credits. Info: 410-828-2688. — **Apr. 23-24**

Healing through loss I, sponsored by the Steven Daniel Jeffreys Foundation, Howard Community College, and Howard County General Hospital. 10 Cat 1 AMA/PRA credits. Fee: $150. Info: Dr. J. Shep Jeffreys, 410-992-4166. — **Apr. 23 and 30**

Professional practice in clinical chemistry: A review, sponsored by the George Washington University, at the Westpark Hotel, Arlington, Virginia. 29 Cat 1 AMA/PRA credits. Fee: $375 AACC members; $475 nonmembers. Info: Maria Gorrick, 202-994-4285. — **Apr. 25-29**

195th annual meeting of the Medical and Chirurgical Faculty of Maryland, at the University of Maryland, University College Conference Center, College Park, Maryland. Info: Betsy Newman, 410-539-0872 or 1-800-492-1056. — **Apr. 29-May 1**

Comprehensive oral radiographic diagnosis: The scanora integrated imaging system, sponsored by the Greater Baltimore Medical Center, at the Physician Pavilion Conference Center, Baltimore, Maryland. 4 Cat 1 AMA/PRA credits. Info: Bonnie Heneson, 410-356-8868. — **May 5**

Practical aspects of forensic medicine, sponsored by the Baltimore City Medical Society, at the Montebello Rehabilitation Hospital, Baltimore, Maryland. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. — **May 6**

9th national conference on prescription medicine: Information and education, sponsored by the National Council on Patient Information and Education, at the Washington Hilton and Towers, Washington, DC. Info: Rachael Carter, 202-347-6711. — **May 6-7**

Practical dermatology for the primary care physician, at the Ritz-Carlton Hotel, Pentagon City, Virginia. Info: 804-446-6140. — **May 6-9**

Virginia Society of Otolaryngology-HNS annual meeting, at the Tides Inn Resort, Irvington, Virginia. Info: Donna Scott, 804-353-2721. — **May 7-8**

Acoustic neuroma: Advances in diagnosis and management, at George Washington University, Washington, DC. 7 Cat 1 AMA/PRA credits. Fee: $100 physicians; $25 residents. Info: John F. Vargo, 202-994-4285. — **May 8**

Clinical auscultation of the heart, sponsored by the American College of Cardiology, at the Georgetown University Medical Center, Washington, DC. 18 Cat 1 AMA/PRA credits. Info: 800-257-4739. — **May 12-14**

Central Atlantic seminar in anesthesiology, sponsored by the George Washington University, at the Grand Hyatt, Washington, DC. 12 Cat 1 AMA/PRA credits. Fee: $150 members; $200 nonmembers. Info: John F. Vargo, 202-994-4285. — **May 13-16**

Maryland Academy of Family Physicians 45th annual meeting and scientific session, at the Princess Royale Oceanfront Hotel and Conference Center, Ocean City, Maryland. 41.25 Cat 1 AMA/PRA credits; 41.25 AAFP prescribed hours. Fee: $240 members; $275 nonmembers; $135 paramedicals; No charge for residents, medical students, MAFP retired and life members. Info: Francis C. Bruno, M.D., 410-747-1980. — **May 18-23**

6th annual trauma anesthesia and critical care symposium, sponsored by the International Trauma Anesthesia and Critical Care Society (ITACCS) and Multinational Academic Consortium, at the Hyatt Regency, Baltimore, Maryland. Info: Kimberly C.A. Unitas, 410-328-2399. — **May 20-22**

Virginia Society of Ophthalmology annual meeting, at the Norfolk Marriott Waterside, Norfolk, Virginia. Info: Donna Scott, 804-353-2721. **May 21-22**

Death and dying: The physician's trials and tribulations, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **June 3**

Systemic lupus erythematosus update for primary care physicians, sponsored by the Maryland Lupus Foundation and the University of Maryland School of Medicine. 5 Cat 1 AMA/PRA credits; 5 AAFP prescribed hours. Fee: $75.00. Info: 410-337-9000. **June 5**

9th annual Eastern Virginia Medical School family medicine review course, at the Cavalier Hotel, Virginia Beach, Virginia. Info: 804-446-6140. **June 6-11**

Substance abuse education for primary care physicians: An overview of treating the substance abusing patient, sponsored by the Medical and Chirurgical Faculty of Maryland, at the Mercy Medical Center, Baltimore, Maryland. 1 Cat 1 AMA/PRA credit; 1 AAFP prescribed hour. Fee: none. Info: Carmine M. Valente, Ph.D., 410-539-0872 or 1-800-492-1056. **June 9**

Board review in family practice, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 41 Cat 1 AMA/PRA credits. Fee: $625 physician; $495 residents and fellows; $395 allied health professionals. Info: John F. Vargo, 202-994-4285. **June 12-16**

INMEDs fourth annual millennium conference, sponsored by the International Medical Services for Health (INMED) and the Tulane University School of Public Health and Tropical Medicine, Sheraton City Centre Hotel, Washington, DC. Info: 703-444-4477. **June 15-18**

11th summer symposium in internal medicine, at the Fort Magruder Inn & Conference Center, Williamsburg, Virginia. Info: 804-446-6140. **June 25-27**

16th annual flap dissection workshop, at the Virginia Beach Conference Center, Virginia Beach, Virginia. Info: 804-446-6140. **July 6-10**

Imaging the augmented breast, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **Sept. 2**

The decade of the brain: An international conference, sponsored by the George Washington University, at the Omni-Shoreham, Washington, DC. 28 Cat 1 AMA/PRA credits. Info: John F. Vargo, 202-994-4285. **Sept. 11-14**

14th international congress of lymphology, sponsored by the International Society of Lymphology (ISL). Part 1: "Frontiers in Lymphology" at the Hyatt Regency, Baltimore, Maryland. Part 2: "Lymphology in 1993" at the Ramada Renaissance Techworld, Washington, DC. Info: Grace Wagner, Program Coordinator, 602-626-6118. **Sept. 20-26**

International liver symposium, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. Info: Daniel E. Reichard, 202-994-4285. **Oct. 1-3**

Causes of the medical malpractice crisis, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **Oct. 7**

Gastroenterology board review course, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 42 Cat 1 AMA/PRA credits. Fee: $625 physicians; $500 residents and fellows. Info: Daniel E. Reichard, 202-994-4285. **Oct. 9-13**

Medical oncology board review course, sponsored by the George Washington University, at the Ritz-Carlton, Pentagon City, Virginia. Info: John F. Vargo, 202-994-4285. **Oct. 9-13**

Continuously throughout the year

Fluorescein angiography conference, sponsored by the Retina Center, St. Joseph Hospital, Baltimore, Maryland, first and third Mondays of each month; 8:00-9:00 am. Fee: none. Info: R. Classon, 410-337-4500.

Shady Grove Adventist Hospital,

9901 Medical Center Drive, Rockville, Maryland. Info: 301-279-6115.

The Johns Hopkins Medical Institutions

All courses at the Thomas B. Turner Building unless otherwise indicated. For information on continuing medical education activities, contact the Office of Continuing Education, 720 Rutland Ave., Baltimore, Maryland 21205 (410-955-2959).

Diagnosis and treatment of neoplastic disorders, medical surgical, and radiotherapeutic aspects. 14.5 Cat 1 AMA/PRA credits. **Apr. 1-2**

Current concepts in thyroid disease: Update 1993. Cat 1 AMA/PRA credits available. Fee: $150 physicians; $40 residents and fellows. **Apr. 16**

20th annual pediatric trends. 45 Cat 1 AMA/PRA credits. Fee: $625 physicians; $375 residents and fellows. **Apr. 19-24**

34th annual postgraduate institute for pathologists in clinical cytopathology. Course A: Home study, March-April 1993. Course B: Lecture series with laboratory studies. 140 Cat 1 AMA/PRA credits. **Apr. 19-30**

Clinical care of the patient with HIV infection, at the Stouffer Harborplace Hotel, Baltimore, Maryland. 13 Cat 1 AMA/PRA credits; 12.75 AAFP credits. Fee: $325 physicians; $165 residents, fellows, and allied health professionals. **Apr. 22-23**

Principles and practice of clinical MRI, at the Stouffer Harborplace Hotel, Baltimore, Maryland. Cat 1 AMA/PRA credits available. **Apr. 22-25**

XII international papillomavirus workshop, at the Hyatt Regency Hotel, Baltimore, Maryland. 30 Cat 1 AMA/PRA credits. Fee: $400 prior to June 30, 1993; $450 after June 30, 1993. Info: Gretchen Shelton, 410-931-8108. **Apr. 22-25**

Pediatric allergy and immunology for the practitioner. Cat 1 AMA/PRA credits available. **May 6-7**

New frontiers in atherosclerosis and lipoprotein metabolism. Cat 1 AMA/PRA credits available. Fee: $200. **May 13-14**

6th summer institute in environmental health studies. Info: Dr. Jacqueline Corn or Linda Lamb, 410-955-2609. **June 7-18**

Basic endoscopic sinus surgery. 19 Cat 1 AMA/PRA credits: lab and lectures; 14.5 Cat 1 AMA/PRA credits: lectures only. Fee: $1,250 laboratory and lectures; $295 lectures only. **June 17-18**

Tuberculosis in the 90s: Epidemiology, treatment, and control. Cat 1 AMA/PRA credits available. Fee: $165 physicians; $85 residents, fellows, and allied health professionals. **June 21**

Control of biohazards in the research laboratory, at the Hampton House Auditorium. Info: Dr. Jacqueline Corn or Linda Lamb, 410-955-2609. **June 21-25**

Coordination and monitoring of clinical trials. Cat 1 AMA/PRA credits available. **July 8-9**

Symposium on bone marrow transplantation–Current concepts and future directions. 7 Cat 1 AMA/PRA credits. Fee: $40. **July 16**

22nd annual diagnostic ultrasound in gynecology and obstetrics and abdomen, at the Stouffer Harborplace Hotel, Baltimore, Maryland. 16.5 Cat 1 AMA/PRA credits. Fee: Physicians: 3 days, $400; 2 days, $300; 1 day, $150. **Sept. 17-19**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

University of Maryland

For each course, additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, Maryland 21201 (410-328-3956) or by calling the phone number listed after a specific program. FAX 410-328-3103.

Infectious diseases in everyday medicine–3rd annual symposium, at the Baltimore Convention Center, Baltimore, Maryland. 12.75 Cat 1 AMA/PRA credits. Info: Eunice Katz, 410-706-7560. **Apr. 19-20**

Continuously throughout the year

Visiting professor program. A directory of speakers and their topics is available to area hospitals and other health care organizations. NO administrative fees are charged for this service. Info: 410-328-3956.

Visiting fellowship in interventional radiology. Five-day practicum for radiologists, including conferences, patient rounds, and laboratory observations. By appointment only. 40 Cat 1 AMA/PRA credits. Fee: $1,200.

Ultrasound: Preceptorships. For physicians or sonographers with six-months of experience in practicing ultrasound. By appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Departmental rounds and conferences. Weekly, hands-on, and lecture presentations hosted by the university's clinical departments. Hour-for-hour Cat 1 AMA/PRA credits available. Brochure available.

Pediatric grand rounds. Every Thursday from September to June, except third Thursday, in the R. Adams Cowley Shock Trauma Auditorium. Info: Bonnie Winters, 410-328-6777.

PHYSICIAN'S RECOGNITION AWARD

During December 1992, the physicians listed below received the American Medical Association (AMA) Physician's Recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

Treatment of Lyme Disease

The following article is from the Medical Letter, Volume 34 (Issue 881), October 16, 1992. It is reprinted by permission of the publisher of The Medical Letter.

Lyme disease, a multisystem infection transmitted by ixodid ticks and caused by the spirochete *Borrelia burgdorferi*, is the most common vector-borne illness in the USA. It occurs mainly in the Northeast, upper Midwest, and California, but cases have been reported in 48 states, and also in Canada and many countries in Europe.

STAGES OF DISEASE - Early localized Lyme disease is characterized by erythema migrans, a pathognomonic skin lesion; some patients may not be aware of the lesion, which can occur in a hard-to-see area such as the buttocks or scalp. Fever, malaise, arthralgias, myalgias, and multiple skin lesions can also occur, possibly as a result of hematogenous dissemination. A minority of patients develop cardiac involvement (usually atrioventricular block), arthritis, or neurologic disease (Bell's palsy or other cranial or peripheral neuropathy, lymphocytic meningitis, or more rarely, encephalitis). Late manifestations include persistent arthritis, typically of the knee, and a variety of neurologic conditions, including encephalopathy and polyneuropathies.

DIAGNOSIS - Serologic testing can help confirm the diagnosis, but specific anti-*Borrelia burgdorferi* antibodies are usually not detectable until four to six weeks after initial infection. Enzyme-linked immunosorbent assay (ELISA) is the usual method of testing; interpretation of results may be complicated by false positives, poor standardization, and asymptomatic seropositivity (LL Bakken et al, JAMA, 268:891, 1992). A Western Blot may help identify false-positive ELISA results. Skin biopsies are positive for *B. burgdorferi* in up to 86% of untreated patients with erythema migrans; aspirate cultures may also be useful (BW Berger et al, J Clin Microbiol, 30:359, Sept 9, 1992; G Wormser et al, JAMA, 268:1311, 1992).

PROPHYLAXIS - The risk of acquiring Lyme disease can be decreased by avoiding heavily tick-infested areas, wearing proper clothing, using insect repellents, and promptly removing ticks. Data from animal studies suggest that transmission of infection is unlikely unless tick attachment persists more than 48 hours (J Piesman et al, J Infect Dis, 163:895, 1991). One controlled trial of antimicrobial treatment after deer tick bites in an endemic area found that only two of 173 patients treated with placebo developed erythema migrans, and none of 193 treated with amoxicillin. One of the two patients with erythema migrans and none of the asymptomatic patients seroconverted (ED Shapiro et al, N Engl J Med, in press). A cost-effectiveness analysis supported empirical treatment of tick bites (D Magid et al, N Engl J Med, 327:534, Aug 20, 1992), but Medical Letter consultants found the study unconvincing.

ERYTHEMA MIGRANS - Oral antibiotic therapy shortens the duration of the rash and, in most patients, prevents development of late sequelae. Doxycycline (100 mg b.i.d.) or tetracycline (250 to 500 mg q.i.d.) has been effective but should not be used in pregnant women or children less than eight years old. Amoxicillin (250-500 mg t.i.d. for adults; 25 to 50 mg/kg/day for children) is also effective and is preferred for children and pregnant or lactating women. One trial in 123 patients with early Lyme disease found cefuroxime axetil (Ceftin), 500 mg b.i.d., as effective as doxycycline (RB Nadelman et al, Ann Intern Med, 117:273, Aug 15, 1992). Treatment failures or relapses have been reported with all regimens.

NEUROLOGIC DISEASE - For patients with Bell's palsy alone, oral doxycycline or amoxicillin is generally used. Patients with other neurologic involvement, including meningitis, other cranial or peripheral

neuropathies, or encephalitis, have been treated effectively with intravenous (IV) penicillin G (20 to 24 million units per day), ceftriaxone (2 grams per day), or cefotaxime (2 grams q8h) (HW Pfister et al, J Infect Dis, 163:311, 1991). The same drugs may be effective for late neurologic complications, including cognitive deficits and polyneuropathies (EL Logigian et al, N Engl J Med, 323:1438, 1990).

CARDIAC DISEASE - Cardiac conduction abnormalities associated with Lyme disease are generally self-limited, but a temporary pacemaker may be necessary (HF McAlister et al, Ann Intern Med, 110:339, 1989). Patients with minor cardiac involvement (first degree atrioventricular block but PR interval less than 0.30 seconds) can usually be treated with doxycycline or amoxicillin. Those with more severe cardiac involvement (including first degree atrioventricular block with PR interval greater than 0.30 seconds) should receive IV ceftriaxone 2 grams per day or penicillin G 20 to 24 million units per day.

ARTHRITIS - Oral therapy with doxycycline or amoxicillin for one month has been effective for Lyme arthritis in many patients (NY Liu et al, Arthritis Rheum, 32:S46, 1989). Patients who have not responded to oral treatment may respond to intravenous therapy; penicillin G (20 to 24 million units per day) or ceftriaxone (2 grams per day) is often successful. For patients who develop refractory arthritis of the knee, arthroscopic synovectomy may be helpful (RT Schoen et al, Arthritis Rheum, 34:1056, 1991). In one study, patients with HLA-haplotype DR4 or DR2 were more likely to have prolonged arthritis, and those with HLA-DR4 had a poor response to antibiotic therapy (AC Steere et al, N Engl J Med, 323:219, 1990).

CONCLUSION - Lyme disease at any stage usually responds to antibiotic therapy, but few controlled trials comparing different regimens have been published. Since the incidence of infection after a tick bite is low, and treatment of early disease is effective and generally prevents late sequelae, prophylactic treatment of tick bites is not recommended.

TREATMENT OF LYME DISEASE[1]

		Drug	Adult Dosage	Pediatric Dosage[2]
ERYTHEMA MIGRANS		Doxycycline[3] (*Vibramycin*, and others)	100 mg PO b.i.d.	
	OR	Amoxicillin (*Amoxil*, and others)	250-500 mg PO t.i.d.	25-50 mg/kg/day divided t.i.d.
Alternative:		Cefuroxime axetil *(Ceftin)*	500 mg b.i.d.	250 mg b.i.d.
NEUROLOGIC DISEASE				
Bell's palsy		Doxycycline[3]	100 mg PO b.i.d.	
	OR	Amoxicillin	250-500 mg PO t.i.d.	25-50 mg/kg/day divided t.i.d.
More serious CNS disease[4]		Ceftriaxone *(Rocephin)*	2 grams/day IV	75-100 mg/kg/day IV
	OR	Penicillin G	20-24 million units/day IV	300,000 units/kg/day IV
CARDIAC DISEASE				
Mild		Doxycycline[3]	100 mg PO b.i.d.	
	OR	Amoxicillin	250-500 mg PO t.i.d.	25-50 mg/kg/day divided t.i.d.
More serious[5]		Ceftriaxone	2 grams/day IV	75-100 mg/kg/day IV
	OR	Penicillin G	20-24 million units/day IV	300,000 units/kg/day IV
ARTHRITIS[4]				
Oral		Doxycycline[3]	100 mg PO b.i.d.	
	OR	Amoxicillin	500 mg PO t.i.d.	50 mg/kg/day divided t.i.d.
Parenteral		Ceftriaxone	2 grams/day IV	75-100 mg/kg/day IV
	OR	Penicillin G	20-24 million units/day IV	300,000 units/kg/day IV

1. Recommendations are based on limited data and should be considered tentative. The duration of treatment is not well established for any indication; it is usually based on severity of disease and rapidity of response. Clinicians generally recommend 10 to 30 days for oral drugs and 14 to 21 days for intravenous treatment.
2. Should not exceed adult dosage
3. Or tetracycline HCl (*Achromycin*, and others), 250-500 mg q.i.d. Neither doxycycline nor any other tetracycline should be used for children less than eight years old or for pregnant or lactating women.
4. In late disease, the response to treatment may be delayed for several weeks or months.
5. A temporary pacemaker may be necessary.

Lyme Disease in Maryland in 1992

The trend of Lyme disease in Maryland from 1987 to 1992 is shown in Figure 1. In 1992 every jurisdiction, except Allegany, Frederick and Garrett, reported cases. The number of cases and incidence rates per 100,000 population by jurisdiction in 1989, 1990, 1991, and 1992 are shown in Table 1.

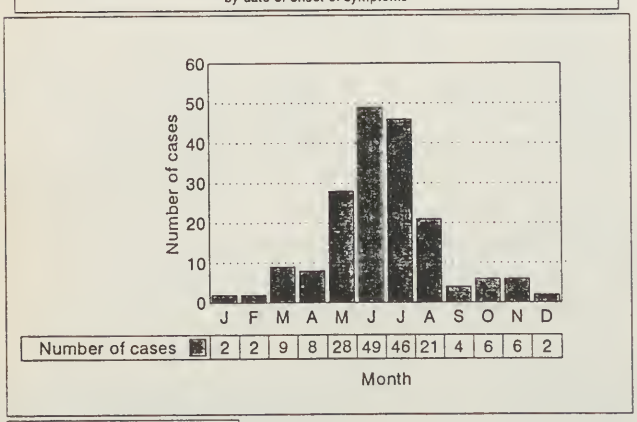

Figure 1. Lyme Disease Confirmed Cases*
1987-1992

* Cases meeting CDC definition

Eighty-one percent of the 192 cases had onset of illness in April through September; the peak incidence was in June (49 cases) and July (46 cases). See Figure 2.

Figure 2. 1992 Lyme Disease Confirmed Cases*
by date of onset of symptoms

* Cases meeting CDC definition

The male to female ratio was 1.5:1.0. Among the cases with known race (182), 164 (90.1%) were white, 13 (7.1%) black, and 5 (2.8%) other race. Ages ranged from 1 to 81 years (mean, median 32 years).

Of the 192 cases, 133 (69.3%) had erythema migrans, 54 (28.1%) had arthritis, 16 (8.3%) had Bell's palsy, 12 (6.3%) had erythema migrans and arthritis, 6 (3.1%) had radiculoneuropathy, 4 (2.1%) had cardiologic symptoms, and 3 (1.6%) had encephalitis. Thirty-two (16.7%) cases required hospitalization.

A definite tick bite prior to onset of illness was reported by 66 (34.4%) cases; 88 (45.8%) had no tick exposure and for 38 (19.8%), there was no available exposure information.

LYME DISEASE STUDY

The Maryland State Health Department and the University of Maryland School of Medicine have received federal funds to study patient outcomes after antibiotic therapy for Lyme disease. This study should provide useful data to assist the practicing physician in managing Lyme disease. Therefore, we urge you to report all suspected cases of Lyme disease to your local health department immediately.

Travelers Alert: Inactivated Japanese Encephalitis Virus Vaccine

Japenese encephalitis (JE) vaccine was available in the United States from 1983 through 1987 on an investigational basis, through travel clinics in collaboration with CDC (1). JE vaccine manufactured by Biken and distributed by Connaught Laboratories, Inc. (Japenese encephalitis virus vaccine, inactivated, JE-VAX), was licensed on December 10, 1992, to meet the needs of increasing numbers of U.S. residents traveling to Asia and to accommodate the needs of the U.S. military.

JAPANESE ENCEPHALITIS (JE) VACCINE IS NOT RECOMMENDED FOR ALL TRAVELERS TO ASIA. In general, vaccine should be offered to persons spending a month or longer in endemic areas during the transmission season, especially if travel will include rural areas. Under specific circumstances, vaccine should be considered for persons spending <30 days in endemic areas, e.g., travelers to areas experiencing epidemic transmission and persons whose activities, such as extensive outdoor activities in rural areas, place them at high risk for exposure. In all instances, travelers should be advised to take personal precautions; e.g., to reduce exposure to mosquito bites.

The decision to use JE vaccine should balance the risks for exposure to the virus and for developing illness, the availability and acceptability of repellents and other alternative protective measures, and the side effects of vaccination. Risk assessments should be interpreted cautiously since risk can vary within areas and from year to year and available data are incomplete. Estimates suggest that risk of JE in highly endemic areas during the transmission season can reach 1 per 5,000 per month of exposure; risk for most short-term travelers may be ≤ 1 per million. Although JE vaccine is reactogenic, rates of serious allergic reactions (generalized urticaria or angioedema) are low (1 to 104 per 10,000). Advanced age may be a risk factor for developing symptomatic illness after infection. JE acquired during pregnancy carries the potential for intrauterine infection and fetal death. These special factors should be considered when advising elderly persons and pregnant women who plan visits to areas where JE is endemic.

Primary Immunization Schedule

The recommended primary immunization series is three doses of 1.0 mL each, administered subcutaneously on days 0, 7, and 30. An abbreviated schedule of days 0, 7, and 14 can be used when the longer schedule is impractical or inconvenient because of time constraints. Two doses administered a week apart will confer short-term immunity among 80% of vaccinees. However, the schedule should be used only under unusual circumstances and is not routinely recommended. The last dose should be administered at least 10 days before the commencement of travel to ensure an adequate immune response and access to medical care in the event of delayed adverse reactions.

The immunization schedule for children 1-3 years of age is identical except that the manufacturer recommends 0.5 mL administered subcutaneously. No data are available on vaccine safety and efficacy in infants <1 year of age.

Protective levels of neutralizing antibody persist for at least 2 years in vaccinees who have completed a three-dose primary series. The full duration of protection is unknown, therefore, definitive recommendations cannot be given on the timing of booster doses. Booster doses of 1.0 mL (0.5 mL for children <3 years of age) may be administered after 2 years.

INTERNIST/FAMILY PRACTITIONER

Board Certified/Board Eligible, full-time for HMO facility in Catonsville, MD area. Challenging environment with excellent salary and benefits. Send CV to Richard Walsh, M.D. at Wilkens Ave. Medical Center, 4660 Wilkens Ave., Baltimore, MD 21229.

G.P. PHYSICIAN

Full-time position. BC/BE, FP - Baltimore area. No nights or weekends. Experience in P.I. a plus. Excellent salary and benefits. Send CV to P.O. Box 522, Timonium, MD 21093.

INTERNAL MEDICINE

Be ready to compete in the future of medicine. Baltimore-based multispecialty internal medicine group seeks BC/BE internist to join 5 established internists in a fee-for-service and managed care practice. Competitive salary with many benefits. Eventual full partnership in low overhead practice. Please send CV to *MMJ*, Box 13.

FAMILY PRACTITIONER

An excellent position is available for a BC/BE family practice physician in a new community health center in Sioux City, Iowa. A full range of family practice medicine is needed in a community that is very supportive of the center. Sioux City is a great place to raise a family and has excellent public and parochial school systems, a community college, two liberal arts colleges, a graduate center, two excellent medical centers, a Residency Training Program (Family Practice), etc. The center offers a competitive compensation and benefit package, paid malpractice, etc. For more information, write Jeff Hackett, Executive Director, Siouxland Community Health Center, 1709 Pierce St., Sioux City, IA 51105 or call 712-252-2477.

PHYSICIANS WANTED

Semi-retired or retired OK/physicians for pleasant office practice part-time. Call 547-2686.

INTERNIST OR FAMILY PRACTITIONER

BC/BE to join growing multispecialty practice in Howard County. Modern facility with laboratory and x-ray on premises. Competitive salary and full benefit package. Send CV to Flowers, Levine, Prada, Diener, Jackson, Conger and Associates, MD, PA, 1055 Little Patuxent Parkway, Suite 104, Columbia, MD 21044.

INTERNIST/FAMILY PRACTITIONER

Board Certified/Board Eligible, full- or part-time for HMO facility in Timonium, MD area. Challenging environment. Excellent salary and benefits. Send CV to Bruce Blumenthal, M.D. at Timonium Medical Center, 2205 York Rd., Timonium, MD 21093.

MMJ Classified Advertising

Effective with the 1993 April issue prepayment is required for all for all classified advertising.

- Cost for Med Chi members is $5.00 per 35 characters or portion thereof (each letter, number, symbol, punctuation mark, or space counts as one character).
- Cost for nonmembers is $8.00 per 35 characters or portion thereof with a minimum cost of $50.00 per advertisement.
- Advertisements placed for the benefit of an HMO or a hospital are charged the nonmember rate.
- Advertisements for services (e.g., collection agencies) or for items not related to the practice of medicine (e.g., real estate sales) are limited to a maximum of three placements per calendar year.
- Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physicians's practice or equipment.
- Box numbers are provided free of charge.
- Advertising copy and payment (checks should be made out to *Maryland Medical Journal*) should be sent seven weeks prior to the first of the month in which the advertisement is to appear.

Box replies and advertising copy should be sent to:

INVESTOR INFORMATION FROM T. ROWE PRICE

TO RETIRE COMFORTABLY, PLAN SERIOUSLY

T. Rowe Price offers two planning kits to help you build a secure retirement. Whether you choose the original *Retirement Planning Kit*, or the PC version, T. Rowe Price can help you build the retirement savings you need.

How much money will you need to retire comfortably? Where will it come from?

As the graphic below shows, today's retirees have to provide fully 60% of their income from savings and earnings.* Clearly, a secure financial future takes informed planning.

The T. Rowe Price *Retirement Planning Kits* can help you manage what may be your largest financial challenge.

FREE—the original *Retirement Planning Kit.* Nationally acclaimed by financial experts and requested by over 400,000 individuals, the kit helps you determine *how much* you will need to save for retirement and *how to invest* to reach that goal. Contents include a detailed overview of the planning process, a comprehensive workbook, and a guide to investing for retirement.

For greater ease, get the $15 PC version. The *Retirement Planning Kit* is also available in an easy-to-install software version. Now available in Release 1.1, the software does the "number crunching" for you, so you can devote more time to exploring different strategies—and see the results instantly. A special "What If" feature enables you to adjust key assumptions.

3.5" also available

Put T. Rowe Price expertise to work for you. A comfortable retirement calls for serious planning. Begin now by requesting your kit from T. Rowe Price, a leading authority on retirement investing.

Rowe Price, P.O. Box 15098, Worcester, MA 01615-9885. (CA residents add 7.25% sales tax, MA and MD add 5%.) Be sure to include your name, address, and phone number and specify disk size: 5.25" or 3.5". Please allow four weeks for delivery. Specifications: Requires IBM®-compatible computer with minimum 512K RAM and DOS/MS-DOS 2.1 or higher (with CGA or CGA-compatible graphics card). If using DOS 4.01, 640K RAM required. T. Rowe Price Investment Services, Inc., Distributor, 100 East Pratt Street, Baltimore, MD 21202.

Inpatient Treatment For Dissociative Disorders

Under the direction of Dr. Richard J. Loewenstein, Sheppard Pratt's treatment program is based on the view that dissociative disorders are readily diagnosed and treated. Utilizing the Armstrong-Loewenstein Dissociative Disorders Assessment Protocol as a baseline, individual treatment planning is determined and the master treatment plan can include:

- intensive therapy specifically designed for people with histories of trauma and abuse;
- psychopharmacology;
- cognitive therapy;
- adjunctive hypnotherapy;
- stress management;
- managed milieu that teaches safe coping skills for symptoms such as: switching, dissociation, amnesia, and flashbacks;
- and a full range of expressive therapies.
- The staff of the DDU also provides education and therapy for the patient's present day family with assessments available for children.

Sheppard Pratt's DDU is available to adult patients with dissociative disorders or other chronic childhood onset, post-traumatic conditions who are:

- newly diagnosed and are unstable or;
- in acute crisis or are decompensating or;
- involved in working through difficult therapy material requiring a safe, secure setting or;
- dangerous to self or others and/or self mutilatory.

For more information or to make a referral, call: Dr. Susan Wait, coordinator for the inpatient DDU at (410) 938-5070.

On May 1, 1993, the Med Chi House of Delegates elected the following officers who will serve through May 1, 1994:

Joseph Snyder, M.D. President
Donald H. Dembo, M.D. President-elect
Paul A. Stagg, M.D. Secretary
Carol W. Garvey, M.D. Treasurer
Alex Azar, M.D. First Vice President
J. Ramsay Farah, M.D. Second Vice President
Thomas E. Allen, M.D. Third Vice President
Allan D. Jensen, M.D. Council Chairperson
J. Richard Lilly, M.D. Council Vice Chairperson

The Med Chi House of Delegates also elected the following physicians to the Board of Physician Quality Assurance:

Frederick Alpern, M.D.
Ira N. Brecher, M.D.
Irvin Cohen, M.D.
Lawrence C. Jones, M.D.

Awards Presented During 1993 Annual Meeting

John O. Meyerhoff, M.D. was the recipient of the Wyeth Ayerst Laboratories Physician Award for Community Service. Dr. Meyerhoff received the award for his work with Parents Anonymous of Maryland.

The 1992-1993 Med Chi president, Jose M. Yosuico, M.D., presented certificates of recognition to the following physicians for their outstanding service and dedication as chairpersons of Med Chi committees:

Paul A. Stagg, M.D., Ad Hoc Committee on Self-Referral
Harrold T. Elberfeld, M.D., Maternal Welfare Subcommittee
Ronald Fishbein, M.D., Ad Hoc Bicentennial Committee
John G. Bartlett, M.D., Ad Hoc Review Committee on Physicians with Bloodborne Pathogens

Dr. Yosuico also announced the winners of the 13th Annual Med Chi Photo Contest:

Jerrold M. Post, M.D. - First Place
Mrs. Morrell L. Williams - Second Place

Jeffrey Jonathan Wise, M.D., a 1993 University of Maryland School of Medicine graduate and member of Med Chi, was presented with the Award for Excellence in Organized Medicine in recognition of his outstanding accomplishments.

Workers' Compensation Survey

On page 482 of this issue, there is an article by Neil A. Robinson, M.D., medical examiner for the Maryland Workers' Compensation Commission. Dr. Robinson provides answers to the most commonly asked questions about Workers' Compensation regulations. Following the article is a survey prepared by the Med Chi Committee on Managed Care and Third-Party Liaison in order to monitor and resolve problems associated with Workers' Compensation. Please take a few minutes of your time to complete the survey. Your responses can help Med Chi address your needs.

Free Training on Blood Collection for Lead Screening

The Department of Health and Mental Hygiene, Office of Child Health, offers free training on the fingerstick method of blood collection for lead screening. A new eight-minute training video has been developed. Call 410-225-6748.

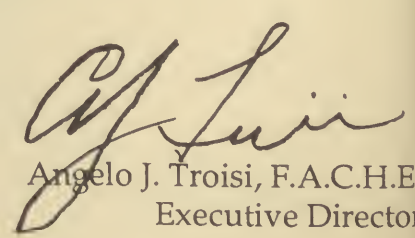
New Medicare Policy

The most recent policy on Mohs Micrographic Surgery under Medicare follows this Executive Director's Newsletter.

1993 Med Chi Semiannual Meeting

The 1993 Med Chi Semiannual Meeting will be held Friday-Sunday, September 10-12, 1993, at the Sheraton Ocean City Resort and Conference Center.

Med Chi has reserved a block of rooms at a special group rate of $110.00 per night for a single/double occupancy room (tax and incidentals not included). To reserve a room, call the Sheraton at 1-800-638-2100 and tell them you will be attending the Med Chi meeting.



Registration form and tentative agenda are on pages 468 and 469 of this issue.

Substance Abuse Education

"Substance Abuse Education for the Primary Care Physician" is a Med Chi-sponsored program that can be delivered in a 1-3 hour format. This program, which can be held at the Med Chi Building or your place of work, is offered at no charge through August 1993. This program is made possible by a special grant and is limited to locations in Baltimore City. The next program is being held at the Baltimore City Health Department on Monday, June 28, 1993, from 1:00 p.m. - 4:00 p.m. For more information, contact Sandy Heim at 410-539-0872 or 1-800-492-1056.

Med Chi Bicentennial Celebration

Med Chi will celebrate its 200th birthday in 1999, and plans for this bicentennial celebration have begun. Anyone interested in providing input, please call Margaret Burri at 410-539-0872 or 1-800-492-1056.

Angelo J. Troisi, F.A.C.H.E.
Executive Director

Medical Policy

SUBJECT: Mohs Micrographic Surgery

EFFECTIVE DATE: 1990

REVISED DATE: Retroactive to 1/1/92

CPT/HCPCS Code(s): 17304, 17305, 17306, 17307, 17310

Description of Service: Mohs micrographic surgery is a microscopically controlled excision of skin cancer usually performed in stages (layers). Each layer-by-layer excision of cancerous tissue is removed and pathologic examination of each stage (layer) is performed by frozen section. All margins are microscopically examined until a tumor-free plane is achieved.

Coverage is available for each stage. Each stage includes removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens and microscopic examination of specimens by the surgeon, up to 5 specimens. Additional coverage is available when more than 5 specimens, any stage, are indicated.

Mohs micrographic surgery requires a single physician to act in two integrated, but separate and distinct capacities: surgeon and pathologist. If either of these responsibilities are delegated to another physician who reports his services separately, these codes are not appropriate.

Clinical Indications: Indications for microscopic controlled excision of skin cancer include recurrent basal cell epitheliomas and squamous cell carcinomas; tumors with indistinct margins, such as sclerosing basal cell epitheliomas; and lesions in such areas as the inner and outer canthus of the eye and tip of the nose, where maximal preservation of normal skin is desirable.

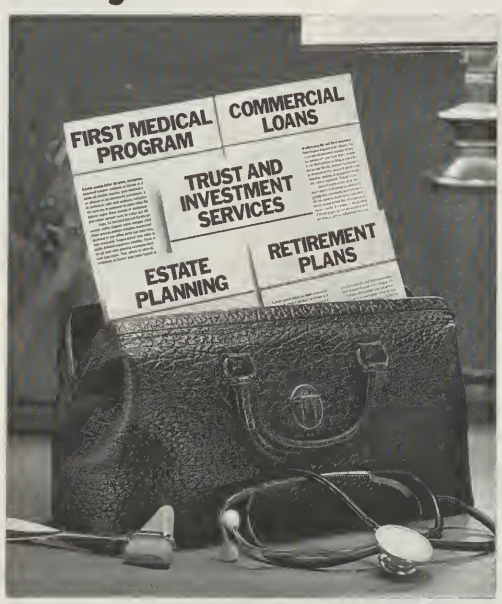
Billing Instructions:

Only 1 initial stage code (CPT 17304) should be paid per surgical site. CPT 17305 and CPT 17306 are reported for the second and third stages respectively. Additional stage(s), up to 5 specimens, should be reported for each stage using CPT 17307. Additional coverage is available when more than 5 specimens, any stage, are indicated (CPT 17310).

Effective for services performed on or after January 1, 1992, each code for Mohs micrographic surgery is paid separately and is not subject to multiple surgery guidelines.

If more than one initial stage is reported because of multiple sites, payment should be made in accordance with multiple surgery guidelines (100%, 50%).

The medical necessity for more than 3 stages (layers) should be documented by report. These services will be reviewed for medical necessity.



When Mohs micrographic surgery requires wound repair, Medicare will provide a benefit for a complex repair including complicated wound closure (CPT 13100-13152), skin grafting or adjacent tissue transfer or rearrangement. If a complex repair is performed, it will be processed in accordance with our multiple surgery guidelines. If the complex repair is the highest priced procedure, it will be allowed at 100% and the Mohs micrographic surgery will be allowed at 50%, including initial stage.

You Don't Have To Put Off Until Tomorrow What Your Family Deserves Today.

RIVER FALLS
Potomac's Family Community.

Right now, the design, the quality and the unique lifestyle of a River Falls home are an all-time best buy. This new generation of Gosnell-built homes are designed with every amenity and offer floor plans that make living easy plus offer the opportunity to customize to your family's lifestyle.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Three, four and even five bedroom homes start in the $600's with absolutely no compromise in quality. There's still terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go beyond the dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities
- Highly regarded public and private schools

Where else can you get such a sound investment with such outstanding returns? Come see it now.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.

HOURS: 12-5 daily. *PHONE: 301-299-3700.*
Brokers welcome.

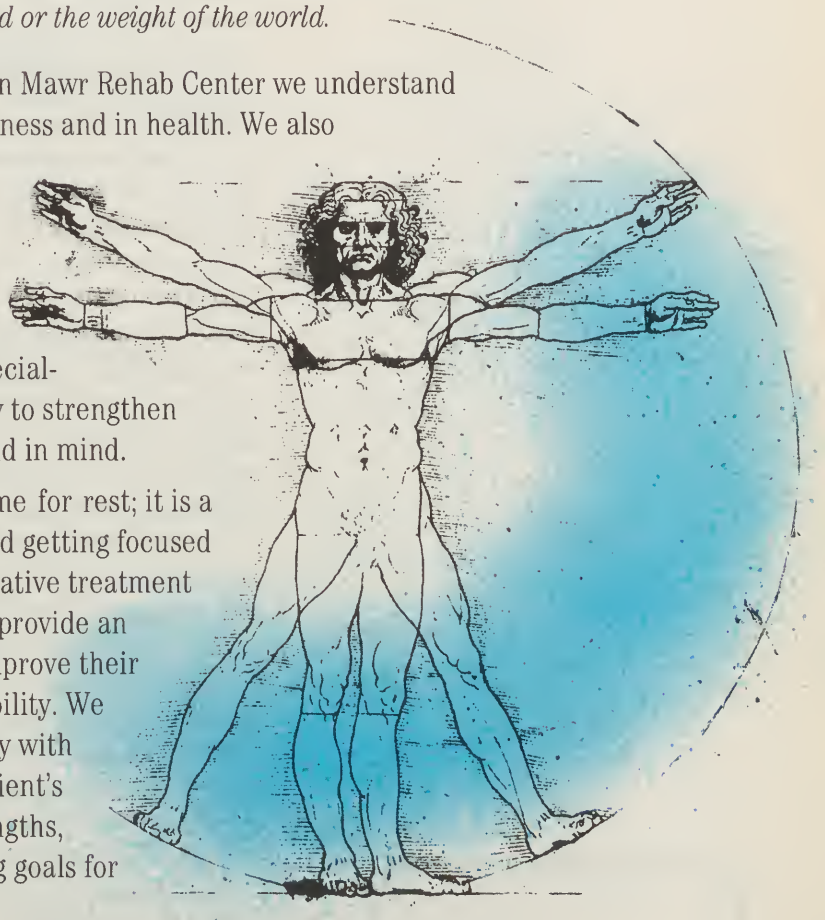
Quality Service to Our Physicians and Patients!

THE BODY

The human body is the most amazing machine ever created.



It can run 26 miles or take one giant step.

It can build muscles of granite or mold nerves of steel.

It can move its toes in the sand or feel its head among the clouds.

It can help a person in need or touch someone without lifting a finger.

It can carry the weight of a child or the weight of the world.

At Maryland General-Bryn Mawr Rehab Center we understand how the body functions in sickness and in health. We also understand that when someone suffers from arthritis, multiple sclerosis or an orthopedic injury, it takes a total commitment from experienced rehabilitation specialists, the patient and the family to strengthen the individual, both in body and in mind.

Rehabilitation is not a time for rest; it is a time to begin moving about and getting focused on being well again. Our innovative treatment programs and modern facility provide an atmosphere where patients improve their endurance, flexibility and mobility. We look forward to working closely with you, your patient and your patient's family. By combining our strengths, we can go a long way in setting goals for recovery and achieving them.

LETTERS TO THE EDITOR

The first recorded case of alcohol abuse—Noah's arcoholism

"While Noah, goblet raised, extols the divine virtues of the grape, a child mutters, 'Grandpa's drunk again,' and God in Heaven pales."[1]

If one accepts the story of Genesis as fact, chronic alcoholism has been a curse to mankind since the days of Noah, about 3500 B.C. Even earlier, God provided Adam and Eve with barley, corn, malt, rye, grapes, and apples for the production of whiskey, beer, and wine. These natural substances, through fermentation, produce the aromatic volatile hydrocarbon—ethyl alcohol (C_2H_3OH), the world's oldest "mind drug." Beer, weak in alcohol content, was apparently unpopular in Biblical times, and whiskey did not become plentiful until distillation began in the fifteenth century. But the Bible mentions wine nearly 200 times.

Noah, a tenth-generation descendent of Adam, survived 40 days and 40 nights of rain aboard the ark with his family and paired zoological specimens. The ark touched terra firma, coming to rest on Mount Ararat seven months after the rain decreased, but almost a year passed before Noah and his family could step out of the ark onto dry land.

Skilled in husbandry, Noah promptly cultivated a vineyard. "He drank of the wine and was drunken, and he was uncovered within his tent."[2] Ham, Noah's youngest son, saw the nakedness of his father, and with derisive laughter he told his two older brothers. When Noah awoke sobered, he became aware of Ham's indiscretion and lack of filial respect, prompting his curse on Ham's descendants, "cursed be Canaan."[3]

"Noah was a righteous man, wholehearted (blameless) in his generations."[4] But was he blameless with his excessive drinking? Psychologists with forgiveness in their hearts absolve Noah from any wrongdoing since he was not knowledgeable of the secondary effects of alcohol or wine consumption.

Brelich, in *Navigator of the Flood*, surmises that Noah's benders were possibly the result of "survivor's guilt."[1] Perhaps Noah, having spent 120 years building the ark, and having endured a year of confinement with his family and a veritable zoo in the stormy vessel, became apprehensive, depressed, and insecure, and resorted to alcohol for its mind-altering effects. Could a "wet brain" with delirium tremens have been

responsible for the hangover harshness of Ham's punishment? As a disillusioned, failed, post-ark paradigm, Noah could have developed a personality disorder, assuming that he was unable to cope with his commitment with God to obey the content of their covenant, the "Seven Commandments of Man."[5]

Since Noah's impropriety indirectly related to his three sons, Shem, Ham, and Japheth, who peopled the nations of the world, he could have saved mankind from many of its disparities if he had not planted the grapevine. Or as a hardened sailor, he could have been sufficiently ingenious to take one of the "three sheets in the wind" to cover his nakedness.

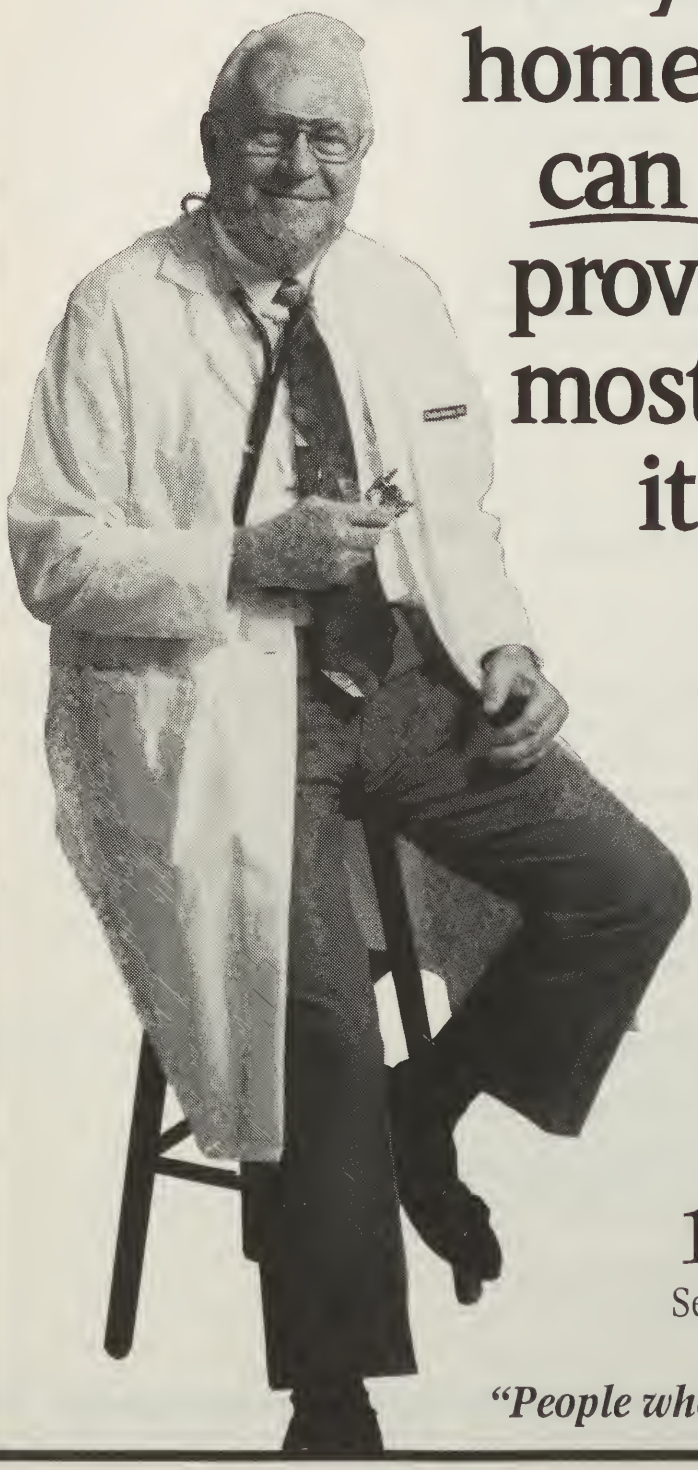
Patients' rights in a nursing home: An update

Your April 1993 edition carried an article which I authored, entitled "Patients' rights in a nursing home." Recent events in Maryland's General Assembly require that the information contained in that article be updated.

The state legislature has passed Senate Bill 664 and House Bill 1243. Should the governor sign either of these bills, Maryland will have a new statute clearly setting forth, for the first time, the rights of individuals, friends and family, and physicians in implementing advance medical decision making. The living will, durable power of attorney, and contemporaneous physician notation will remain avenues for the expression of patient desires. The bills create procedures to be followed in effectuating those desires.



Two impending changes in the law are particularly worth pointing out. For the first time, friends of the patient will be entitled to participate in decision making on behalf of a patient who cannot give consent, if no family members are available. Second, under the circumstances set forth in the bills, substitute decision making by family and friends can be used to order the withdrawal or withholding of care.

Physicians will, of course, need to familiarize themselves with the details of the new legislation to assist their patients and patients' families in important medical decision making.

"People who care for people who need care"

Preparing Hopkins medicine for the 21st century: An interview with Dean Michael M.E. Johns, M.D.

Victor R. Hrehorovich, M.D. and Betsy Newman

Dr. Hrehorovich is editor of the Maryland Medical Journal. *Ms. Newman is director of communications, Med Chi, Baltimore, Maryland.*

"My basic philosophy of medical education is not to create a neurosurgeon, a family practitioner, a cardiologist, or a general pediatrician," says Michael M.E. Johns, M.D., dean of the Johns Hopkins University School of Medicine. "My goal is to create an undifferentiated physician who is fully capable of taking any path after graduating medical school."

This philosophy lies at the foundation of the innovative new curriculum for the school of medicine. "There's core knowledge every physician should know upon completion of medical school, no matter what he or she is going to pursue," explains Dr. Johns. The new curriculum is the first of many changes that have taken place since Dr. Johns took over as dean in July 1990. In his meeting with Dr. Victor R. Hrehorovich and Betsy Newman, Dr. Johns shared his views on medical education, research, and the future of clinical care.

On becoming dean

"It was evolutionary rather than revolutionary," says Dr. Johns about his ascension to leadership. It began just one month after arriving at Hopkins, when he tried to schedule a patient for an outpatient laryngoscopy. "I was told that Hopkins didn't have such an outpatient unit," he says. Rather than rescheduling the procedure, Dr. Johns arranged to have his patient arrive in the morning, change clothes in a closet, and go home shortly after surgery.

"After that, I went through the operating room schedule and checked off every case I thought could have been done as an outpatient. Then I went back and checked off those cases that didn't have to come in the day before the surgery, but could have come in on the morning of the surgery. No one seemed too interested in my list until I told them it would save the hospital millions of dollars." A few days later, Dr. Johns found himself as the chairperson of the ad hoc Same-Day Surgery Committee. This committee went on to create Hopkins' first ambulatory surgical center.

"I continued to work and become more active in committee work," says Johns, who was asked to serve as associate dean for clinical practice in 1986. While serving in this part-time position, he became involved in many larger

institutional problems. "When the opportunity to interview for the deanship came along, it wasn't a foreign idea to me."

When Dr. Johns became dean in 1990, he admits that he did not realize the complexity of his new position. "I thought of the dean as the steward of academic values," says Johns. "I thought all deans did was sit around, make a few decisions here and there, think academic thoughts, and channel orders outward to associate deans. I really knew it was more involved than that, but I didn't understand the breadth of the job. I don't think anyone can understand the full breadth of an institution until you sit in the dean's seat."

He recalls one of his first days as dean when he was reading notes from his electronic mail. "Someone in biophysics sent me a note about a synchotron," he says. "How was I supposed to know what a synchotron was?"

Dr. Johns acknowledges that he underwent a great deal of on-the-job training. "I didn't know how to ask people for money properly, how to work with alumni, or how to work with all the special interest groups," explains Dr. Johns. "There's not a school for learning these skills. Most leaders just evolve."

Curriculum

Revising the curriculum was one of Dr. Johns' first priorities as dean. "A major concern of mine about the traditional first years of medical school was that they are so didactic and driven," says Dr. Johns, who dislikes the fact that many medical students must sit in a classroom and absorb information from 8 a.m. to 5 p.m. "Having students just collect data and facts doesn't seem like a practical approach for the future." Two interesting features of the new Hopkins curriculum include an emphasis on infomatics and the elimination of formal afternoon classes.

The new format also includes Dr. Johns' concept of self-learning. "A physician doesn't graduate from medical school and stop reading or stop teaching or stop learning," he says. "You've got to continue to feed information into your head. Otherwise, you can't be effective. Curiosity is one of the most valuable traits of a physician."

Introduction to clinical medicine

Dr. Johns maintains that most people who enter medical school are driven by the idea of helping people, and yet most students do not ever see a patient until after they have completed two years of study. To address this problem, the new curriculum includes an introduction to clinical medicine, which links first-year medical students with one of 60 participating community physicians. For one afternoon every other week, first-year students observe physicians in their offices. The goal of the program is not to learn about medical procedures, but to learn how a physician relates to people. As part of this study of the physician/patient relationship, students are required to select a patient and study how that individual's medical problem affects activities of daily living. "The students have gotten to know their mentors and have developed nice relationships," says Johns. "I think it's important for Hopkins' whole generalist thrust. It's a great opportunity for students to see, early on in their career, what a generalist does. Students don't see only what someone on the cutting edge is doing. They really see both sides of it."

Figure 1. Dr. Johns, top right with (top to bottom) wife Trina, daughter Christina, and son Michael.

Physicians and society

In addition to addressing the physician/patient relationship, the new curriculum stresses the physician's role in the community. Students are required to take *Physicians and Society*, a course that combines medical ethics with the history of medicine and runs throughout all four years of medical school. The course also teaches the fundamentals of cultural anthropology, sociology, law, epidemiology, and medically oriented art and literature. "We really need to be certain that our students understand themselves and the world around them," says Dr. Johns. "They are part of the society in which they live. You can't be an ethical physician unless you understand in some depth the society in which you function."

Journal club

Another program created to emphasize the self-teaching process is a weekly journal club where students learn to analyze and read medical journals critically. "My son called me the first week after he went to journal club," Dr. Johns recalls. (Both his son, Michael, and his daughter, Christina, are enrolled in the medical school.) "He said they had discussed a paper from *Science* magazine on membrane receptors for growth hormone. I asked: 'Did you understand it?,' and he proceeded to tell me all about growth hormone. He had been an economics major, so I was really impressed."

Student reaction to the new curriculum has been positive. "I think some of the faculty may have the sense that it takes a little bit more work," admits Dr. Johns. "That's probably true because they need to sit back and rethink—'What is my lecture going to be like?' 'How am I going to address a small group?'"

Residency training

"There is clearly a strong perception that we should have more generalists," says Dr. Johns, who believes that sub-specialization training is out of control. In a 1992 address on the future of medical education, Dr. Johns stated that "a form of fellowship fetishism has developed that bears little or no relationship to the needs of either physicians or society."

Residency training, according to Dr. Johns, should be based on goals and objectives, and not on years of service. "I have this notion that in many residency programs, you serve your term of incarceration. You could serve three, four, five, or even ten years. There's nothing magic about the numbers." Dr. Johns believes a more efficient program would require residents to reach certain milestones. Once each goal is attained, the resident would move on to the next level of the program, regardless of the amount of time served.

Dr. Johns notes that physicians who complete their residency training are not considered master clinicians. "They haven't had enough experience," he says. "I think that's one of the problems with trying to create treatment paradigms." Paradigms, says Dr. Johns, make the wrong assumption that every patient is exactly the same. "When physicians encounter patients, they have to compare the patients with people with similar complaints and problems. Sometimes it doesn't quite jibe. That's why a senior clinician may look at a problem in a totally different way from a junior clinician."

Physician distribution and specialization

One way Dr. Johns believes many residents can gain valuable experience is through a national health service corps. Dr. Johns speculates that the corps could be used to address the need for physicians in underserved areas. "You can't force distribution of physicians," says Johns, who believes that

Figure 2. Dr. Johns, fourth from left, meets with some members of his senior staff. Left to right, Richard Grossi, associate dean for finance and administration; Paul Hoffstein, assistant dean for clinical practice; Dr. David Blake, senior associate dean; Dr. Catherine DeAngelis, associate dean for academic affairs, and Dr. John Stobo, acting associate dean for clinical practice.

without special areas in which corps physicians would be required to serve, most practitioners would avoid underserved areas in many urban and rural settings.

Dr. Johns also promotes a more rational system of distributing residents through a national commission on graduate medical education that would be charged with assessing national and regional health care needs. The number of slots available in each area would be based on each facility's specific needs and capabilities. He believes the system could be one way of controlling overspecialization while also ending service problems.

Overspecialization is another problem Dr. Johns hopes to address as dean. "We need more generalists," he says. "But I don't think we'll solve this problem in the near future." He cites a University of Wisconsin study that claims that if 50% of all graduating medical students were to pursue primary care specialties beginning in 1995, 50% of physicians would be generalists by the year 2040.

Research

"The research side is also very exciting," adds Dr. Johns. "The opportunities are unbelievable." Since Dr. Johns became dean, Hopkins jumped from number two to number one in the amount of National Institutes of Health (NIH) funding it receives for medical research. In 1992, Hopkins received $157 million in NIH grants.

Recent research advances at Hopkins include work by Bert Vogelstein, M.D., and a team of scientists at the Johns Hopkins Oncology Center. The Vogelstein team has mapped the genetic changes leading to the development of colon cancer. Their research reveals that one of these mutations produces an altered version of the p53 gene. These mutations could be used as a tool to detect presymptomatic colon cancer years before current "early detection techniques." In addition, Dr. Vogelstein's *in vitro* research has shown that replacing the mutated p53 gene with a normal gene stops the growth of colon cancer cells.

One of Dr. Vogelstein's former fellows, David Sidransky, M.D., recently showed that mutated p53 cells are shed in patients with early bladder cancer. Because these cells can be detected in the urine, there is the potential for a simple urine test to detect early bladder cancer.

Dr. Johns finds the clinical applications of this type of research fascinating. "Can you imagine preventing arthritis or preventing or making an early diagnosis of diabetes? I think these are real events that will occur. We will be able to correct the disease before the ravages of the disease take effect. That means we save money as well. I have confidence that we will find *in vitro* techniques that will work. What a dramatic effect that will have on health care."

The future of clinical care

Dr. Johns maintains that the future of medical care is here today. He cites a study by the American Hospital Association showing that in 1990, the number of outpatient surgeries surpassed the number of inpatient surgeries for the first time ever. With the increasing use of laparoscopes, Dr. Johns predicts the number of outpatient surgeries will continue to increase. "Much of what we now call primary and secondary inpatient care will be outpatient," says Dr. Johns. "I had a physician recently who did a vaginal hysterectomy on an outpatient. Technology will drive us that way."

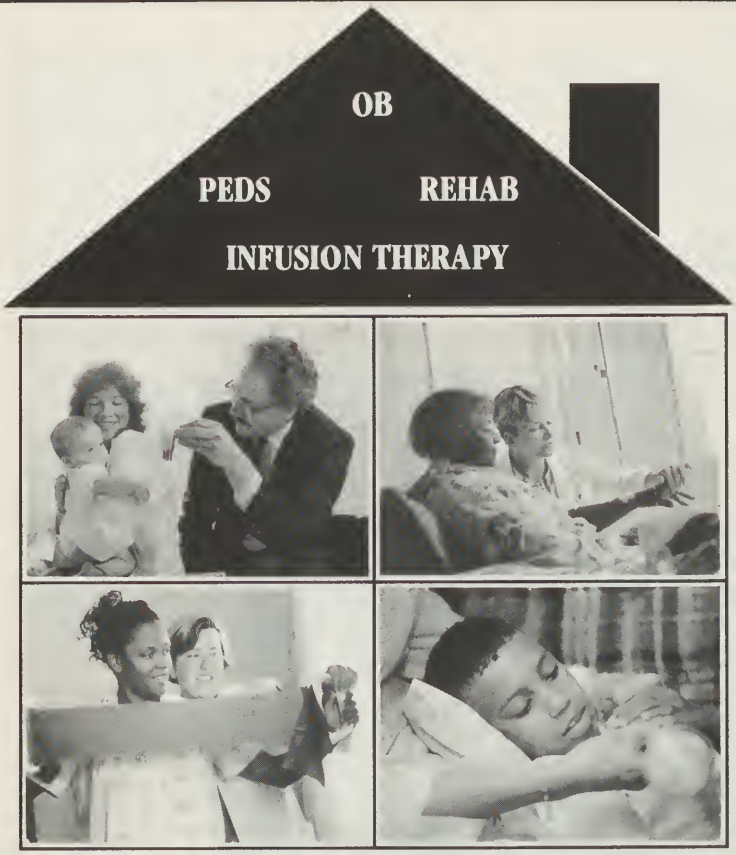
Yet despite technological innovation, Dr. Johns retains some skepticism. "Can we get from the year 1993 to the year 2000 without being totally dismantled?," he asks. Critical of the health economists who are formulating health care policy, Dr. Johns says, "They're not creating health **care** policy. They're creating health **cost** policy." "We must develop a workable vision of a nationwide health system."

Dr. Johns cautions against efforts to cut costs. "We're spending too much time talking about costs and not enough time talking about patients," he says. He expresses his desire for the medical school to be more responsive and efficient as a patient care delivery system. Hopkins' service culture, believes Johns, should be of the same quality as its research. "I believe we have some of the world's best physicians here. The issue is: how do they work as a symphony rather than as a group of individual virtuosos. Society would like us to come together and work as a symphony. That symphony should include cost-effective, high-quality patient care."

Overall, Dr. Johns is optimistic about the future of medicine and the Johns Hopkins University School of Medicine. Through all the worries about cost control and system reform, he sees amazing possibilities in the years to come. "Academic medical centers are on the verge of tremendous medical breakthroughs that will transform medicine," he says. "Hopkins has a tradition of excellence. I can only hope to try and sustain that in the future, as the Hopkins medical school begins its second century." ■

YESTERDAY, TODAY AND TOMORROW

Yesterday Renowned for our consistently high standards, we believe that excellence is never "old fashioned". We developed a laboratory based on high quality, state-of-the-art testing methodologies, personal service, and dedicated patient care.



Today As an industry leader using the most advanced scientific technology, we continue to process your laboratory needs efficiently, quickly and cost effectively. Our skilled staff of pathologists, medical technologists, and hundreds of administrative and support personnel remain dedicated to personal service and personal care.

Tomorrow New technology may bring us an even brighter future, but it will never surpass the human element in our service. Our tradition of caring, and old fashioned pride will never change. Our commitment to excellence will continue to shine brightly in the years ahead.

Creating the medicine of tomorrow: Ten hot Hopkins research areas today

David A. Blake, Ph.D.

ABSTRACT: *From its very beginnings, the Johns Hopkins School of Medicine has fostered the development of physician scientists whose research and practice of medicine are closely intertwined. As a result, the long list of medical breakthroughs—of Hopkins "firsts"—has put the institution at the forefront of medical research in the past century. This tradition continues today, with research in many and diverse areas. Ten current projects underway at Hopkins, attempting to unravel mysteries in neurology, oncology, genetics, hematology, and nephrology, are described in this article. All hold promise to continue the reputation of Johns Hopkins as a leader in research, to become new milestones in the progress of modern medicine.*

Dr. Blake is senior associate dean at the Johns Hopkins University School of Medicine and is responsible for the school's research and technology transfer programs.

"Truth and utility are the very same thing," said Francis Bacon three centuries ago. From its inception, Hopkins has been a leader in putting this message into practice, by nurturing the physician scientist and giving equal weight to pure science and clinical medicine.

When the Johns Hopkins University School of Medicine opened in 1893, it was the first American school to insist on extensive premedical training. Small classes, laboratories in the basic sciences, teaching at the bedside in the clinical years, and the training of investigators who could relate the basic sciences to human disease were Hopkins hallmarks from the start. Hopkins became what no medical college had ever been: a center of basic as well as applied science.

So it was not by accident that Hopkins became an internationally renowned center for biomedical discoveries. The first medical school to give doctors the luxury of being paid to do research, Hopkins' long list of firsts has helped revolutionize the practice of medicine over the course of the last century. That tradition continues.

Today, Hopkins scientists continue to make tremendously exciting discoveries in fields that range from clinical genetics to neuroscience, from biophysics to oncology, from molecular pharmacology to

hematology—discoveries that may again completely change the approach to disease.

Discoveries in molecular genetics, for example, may soon be transferred from the bench to the bedside. Eventually, physicians may be able to locate defective genes and remove, replace, or repair them before they can cause such problems as cancer or diabetes.

In another field, integration of the science of the brain, behavioral science, and the clinical neurosciences promises a profound understanding of ourselves and entirely new approaches to neurologic and behavioral disorders. Transplantation of cells and organs is opening new possibilities for treating a broad range of diseases. Prevention of illness, rather than treatment of end-stage disease, will gain increasing emphasis. In all these areas, Hopkins scientists and physicians will continue to be at the forefront of discovery and application of knowledge for the benefit of humankind.

Every decade, a very few studies emerge as milestones that move medicine forward. A century from now, when our great-grandchildren look back on today's research, which advances will be considered the seminal studies that revolutionized the practice of medicine? Which papers will be chosen as the greats of the next hundred years?

Ten of the most fertile research areas at Hopkins now are all likely candidates for that future list of greats.

Ephemeral messengers in the brain

Science magazine declared nitric oxide the "molecule of the year" in 1992, when research from neuroscientist Solomon Snyder's laboratory helped elevate the status of this gas from toxic molecule to crucial carrier of messages between brain cells **(Figure 1)**. The gas was previously known to be a relaxer of blood vessels, but the discovery of nitric oxide's function in the brain established gases as an entirely new class of neural messengers and created a whole new way of thinking about biological signaling. Snyder's studies on the basics of nitric oxide—how it works, where it's found and regulated, and how it can go awry—also may have clinical implications for stroke, Alzheimer's disease, and Huntington's disease.

Figure 1. In 1992, neuroscientist Solomon Snyder's laboratory helped elevate the status of nitric oxide from toxic molecule to crucial carrier of messages between brain cells. (Photo by William Coupon.)

Recently, a second gas—carbon monoxide—was found to carry signals between neurons as well. And other research—a collaboration between urologists and neuroscientists—solved an age-old mystery by demonstrating that nitric oxide, in transmitting signals from nerves to muscles in the penis, is responsible for penile erections. This discovery one day may yield new treatments for impotence, which affects one in 10 American men.

p53: A gene that suppresses cancer

Intense investigation at Hopkins focuses on two innovative approaches to combating cancer. Both involve manipulating the body's own natural defense systems so that they kill cancer cells and leave normal cells unharmed.

In Bert Vogelstein's laboratory, researchers have laid bare the molecular genetics of colorectal cancer, the second most common form of cancer in the United States. They have discovered that colon cancers result when a number of mutations arise in two different types of genes—oncogenes and suppressor genes such as p53.

In 1990, Vogelstein **(Figure 2)** found that replacing just one mutated p53 gene with a normal copy is enough to stop the growth of cancer cells—at least in a test tube. Though it may never be possible to insert a normal copy of this gene into people with colon cancer, understanding how suppressor genes such as p53 work may lead to the development of drugs that could turn off the cell growth switches.

Vogelstein's team also discovered an association between p53 and tumors of the breast, lung, brain, ovary, and bladder, making it the most common genetic alteration that occurs in human cancers. Recently, the researchers found that the normal job of the p53 suppressor gene is to help healthy cells respond to DNA (deoxyribonucleic acid) damage caused by environmental carcinogens. When p53 functions properly, it tells genetically damaged cells to stop making new DNA. But if the gene is missing or mutated, the injured cells continue to divide, and that contributes to the development of a cancer. Further research on how this mechanism works is essential, since as many as 80% of all cancers may be due to exposure to environmental carcinogens.

Scientists also found that another suppressor gene, called APC, is responsible for colon cancer when a mutated version of it is inherited. Members of at-risk families now can be screened for mutant APC genes prenatally or after birth. Another test developed by the lab detects mutations of the ras oncogene in

Figure 2. In 1990, Bert Vogelstein, M.D. found that replacing just one mutated p53 gene with a normal copy can stop the growth of cancer cells—at least in a test tube. (Photo by Peter Howard.)

stool samples. The ras oncogene is a growth-promoting gene that the team had previously linked to colon cancer.

Currently, more than 58,000 people die each year from colon cancer. The new tests may allow colon cancer to be detected in the early, premalignant stage, when it is almost always curable.

Fighting cancer with the body's own "smart bombs"

Taking a slightly different tack, cancer researcher Drew Pardoll has stopped tumor growth in mice by genetically stimulating the animals' own immune systems. In the fall of 1991, he was the first to show that gene therapy could cure an animal of an already established tumor—a renal cell cancer. Phase I trials to test this approach on human cancers are about to begin.

Pardoll's approach involves calling the body's natural cancer-fighting chemicals into action from within the tumor cells. He genetically engineered mouse tumor cells to secrete large doses of a natural chemical called Interleukin-4 (IL-4). The IL-4 stimulated an immune response that destroyed the mice's cancer.

Ordinarily, immune system cells called T-cells produce IL-4, but for a yet unknown reason, T-cells are not properly activated in cancer. Pardoll's genetic manipulation activated the T-cells. Once activated, these cells function like "smart bombs," killing the specific target but leaving little collateral damage.

Preventing cancer by protecting cells: The broccoli connection

The work of Vogelstein and Pardoll offers great hope for developing new ways to treat cancer, but many scientists believe the greatest hope of all lies in prevention, and it is therefore essential to make that a research priority. Molecular pharmacologist Paul Talalay, who heads a program to develop strategies for protection against cancer, points out that despite tremendous advances in our understanding of the process of carcinogenesis, survival rates have not changed much over the last two decades.

Talalay studies chemicals that increase the resistance of cells to external carcinogens. Last year, he identified and isolated a potent chemical found in broccoli and other vegetables that appears to protect human cells against cancer—a finding that attracted worldwide attention **(Figure 3)**.

He found that one variety of broccoli contained especially high levels of this cancer-fighting chemical, called sulforaphane. His lab now is testing sulforaphane's ability to block tumor formation in animals.

Human epidemiological studies have repeatedly shown that eating cruciferous vegetables such as broccoli and brussels sprouts

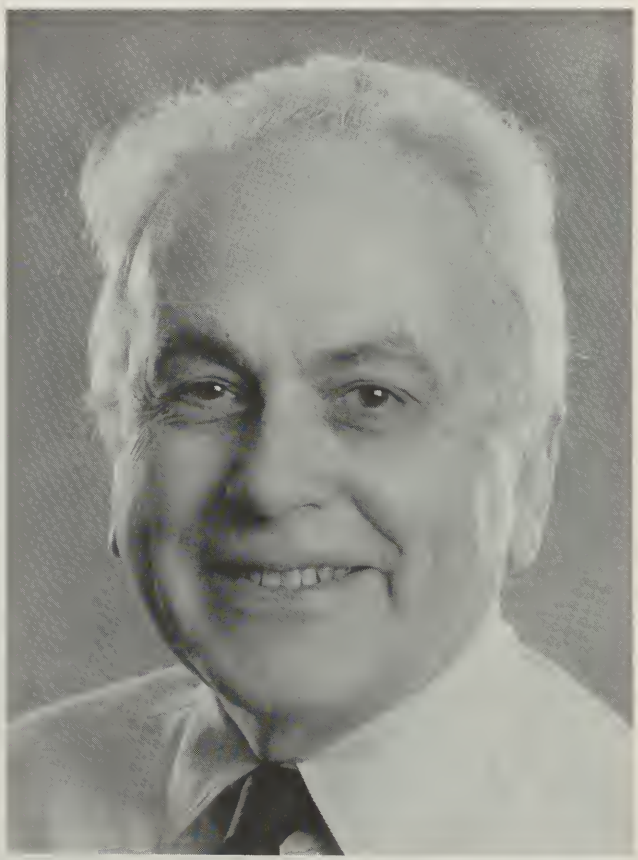

Figure 3. Last year, molecular pharmacologist Paul Talalay identified and isolated a potent chemical found in broccoli and other vegetables that appears to protect human cells against cancer. (Photo by Robert Smith.)

lowers the risks of developing some types of cancer. Talalay's work has forged a new link in our understanding of how this chemoprotective process works on a cellular level.

Zinc: A major player in development and disease

Biophysicist Jeremy Berg's research on the DNA-binding proteins known as zinc fingers yields new insights into how a single cell develops into a complex organism (**Figure 4**). Although results are still preliminary, zinc finger studies are providing a new avenue of research that could have clinical implications for the treatment of both cancer and acquired immunodeficiency syndrome (AIDS).

The hundreds of different zinc finger proteins in the human body make many of the decisions about which genes are activated and which are shut down in a given cell. The name "zinc finger" comes from the fact that zinc, the second most abundant metal in the body, is the glue that holds these proteins together. About 1% of all human genes are now thought to be zinc finger genes.

Each zinc finger is designed specifically to bind to one DNA sequence and not others. Berg's work someday may enable researchers to custom-design zinc fingers to bind to particular DNA sites, which could lead to new therapies for diseases that involve defective zinc fingers. To treat Wilm's tumor, a childhood kidney cancer, for example, Berg envisions replacing a mutated zinc finger gene that fails to stop cell division at the proper time with a normal one that stops excess cell growth.

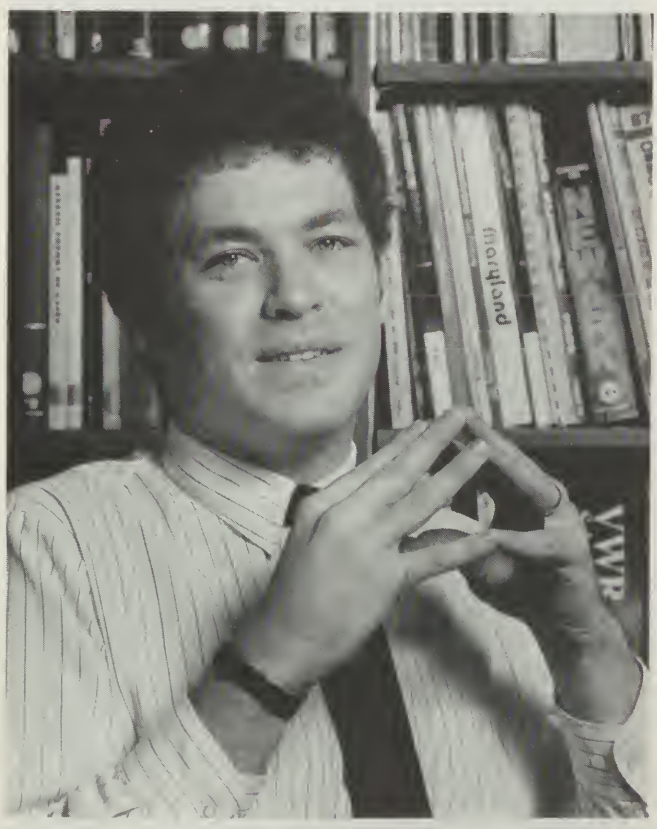

Figure 4. Biophysicist Jeremy Berg's research on zinc fingers has yielded insights into how a single cell develops into a complex organism. (Photo by E.M. Sweeney, Jr.)

Sickle cell successes

Although sickle cell was one of the first disease genes to be identified in the early 1980s, recent advances in treating the painful blood disorder have come not from geneticists but from fortuitous happenstance and multidisciplinary collaboration among Hopkins researchers.

In patients with sickle cell disease, the normally soft, round red blood cells become rigid and sickle-shaped. Painful crises occur when these sickled cells get jammed up in the blood vessels as thumbtacks would if they tried to flow through a rubber hose. Preventing these episodes drives the research in sickle cell disease therapy.

Pediatric hematologist George Dover, who is said to know more about fetal hemoglobin than any researcher in the country, discovered that some individuals retain the ability to produce fetal hemoglobin into adulthood (**Figure 5**). Normally, only fetuses and babies under six months old produce fetal hemoglobin. The gene that triggers its production shuts off at about that time, so that most adults have only minute amounts of this type of red blood cell. In people with sickle cell disease, this type of hemoglobin can reduce the number of sickled red blood cells circulating in the blood stream and lessen the frequency and severity of the painful vaso-occlusive crises that characterize the disease.

In 1990, Dover and his colleague Sam Charache published a ground-breaking study, in collaboration with researchers at the National Institutes of Health (NIH), showing that hydroxyurea, a chemotherapy agent, elevated fetal hemoglobin by as much as 10-fold. But the agent had too many side effects to be tested in children.

In 1992, NIH researcher Dvorit Samid informed Dover that a drug called phenylbutyrate also raised fetal hemoglobin levels. Developed by Hopkins pediatrician and metabolism specialist Saul Brusilow, phenylbutyrate had been used for 10 years without side effects in children with rare inborn errors of metabolism. Clinical trials using phenylbutyrate to treat children with sickle cell disease are in progress with promising results so far.

A diet that slows kidney disease

Kidney disease is still one of the nation's big killers. Nearly 200,000 Americans must undergo dialysis regularly or receive a kidney transplant, at an annual cost of $7 billion. Mortality rates on dialysis average 20% per year.

Over two decades ago, research nephrologist-pharmacologist Mackenzie Walser prescribed relatively simple dietary

Figure 5. Pediatric hematologist George Dover discovered that some individuals retain the ability to produce fetal hemoglobin into adulthood. (Photo by Vince Rodriguez.)

changes to forestall end-stage kidney disease. He and his colleague William E. Mitch were the first to show that a low-protein, largely vegetarian diet supplemented with ketoacid analogues of amino acids could temporarily slow the progression of kidney disease and, for some patients, postpone costly dialysis treatments.

The ketoacid-supplemented diet, developed in 1970 by Walser and his associates, was designed to decrease the amount of waste nitrogen produced in the body, which is mostly derived from dietary protein. Patients on the diet eat vegetables, sugar, and starches. Supplements called ketoacids make up for the inadequate level of protein in the diet, preventing protein deficiency. In patients with malfunctioning kidneys, ketoacids can reduce the buildup of the toxic amounts of urea that would otherwise result as proteins are broken down. Walser and his colleagues were the first to develop practical methods for making large quantities of these keto-analogues of essential amino acids in the lab.

A 16-center trial of the regimen involving hundreds of patients has recently ended, and the results will soon be reported. In addition, Walser and his colleagues have just published their fourth study on the diet. The study, in the April 1993 *Kidney International*, shows that the ketoacid-supplemented diet can both reduce biochemical abnormalities and slow the progression of renal failure toward the end stage.

Lorenzo's oil in the limelight

Research is progressing at Hopkins on an even more intractable childhood disease known as adrenoleukodystrophy (ALD). ALD results from a genetic defect in which the patient is unable to make the CoA derivative of long chain fatty acids, resulting in a rapid progression to a vegetative state and death within five years. ALD was portrayed in the recent movie, *Lorenzo's Oil.*

In 1981, pediatric neurologist Hugo Moser developed a blood test for diagnosing this rare genetic disease. The Kennedy Kreiger Institute, a Johns Hopkins affiliate, is one of only two centers in the world where the test is performed. Moser, now in the third year of a five-year clinical trial with more than 250 patients, wants to determine whether the oil can slow the rapid mental and physical deterioration that characterizes ALD as the sheath around nerve fibers is destroyed. So far, the clinical trials with Lorenzo's oil show that it does not benefit those with moderate or severe ALD, but the greatest hope is that the oil will prevent boys who are now asymptomatic from developing the disease. Moser cautions that this clinical trial should not raise hopes prematurely about a cure for ALD. The recent publicity highlights the need for further research, as well as focusing public attention on the current process by which new treatments are brought from the bench to the bedside.

When blood does more harm than good

Reperfusion injury, the idea that tissues are damaged not when blood flow is cut off, but from toxic reactions when it returns, is a theory that occupies researchers in 23 labs throughout Hopkins. This plethora of reperfusion research is aimed at finding potential therapies for stroke, heart attacks, and other ills of interrupted circulation that strike thousands of people each year.

Understanding the mechanism of reperfusion injury suggests that physicians could have more time to treat patients before damage is irreversible. For the first time, researchers may have medicines to prevent tissue death when blood supply is lost, then found.

The culprits in reperfusion injury are free radicals, highly reactive molecules with a violent and disruptive nature. Normally, free radicals, by-products of oxygen, exist in small amounts in cells. An enzyme called superoxide dismutase (SOD) regularly sops up these free radicals, preventing them from wreaking havoc on cells and tissue. But when the oxygen supply is shut off, the building blocks of free radicals accumulate. With the sudden return of oxygen, a

great concentration of free radicals overwhelms the natural SOD defense system, and cells die.

Scientists at Hopkins are fast discovering that free radical damage occurs in a great many tissues and situations. Surgeon-researcher Gregory Bulkley believes that this is a common pathway to tissue damage in diseases as disparate as arthritis, heart attack, pancreatitis, circulatory shock, alcohol damage, and sunburn.

Richard Traystman does some of the country's most significant brain research on reperfusion. He is collecting data on the timing of free-radical production and the point-of-no-return in brain injury in order to plan clinical studies. Preliminary studies on animal brains and hearts show that manipulating SOD does reduce injury.

Current research efforts focus on defining various organs' windows of opportunity, the time during which it is possible to intervene and prevent cell death. In brain tissue, scientists believe the window may be large—close to an hour. Further studies may change the definition of brain death, and even lead to the first-ever therapeutic interventions for ischemic stroke.

Pioneers in the treatment of Marfan syndrome

Prophylactic treatment—both medical and surgical—developed at Hopkins now prevents the life-threatening results of a genetic defect known as Marfan syndrome. This inherited connective tissue disorder results in a dangerous stretching of blood vessels leading to the heart, as well as abnormal height and eye lens dislocation. It affects one in 10,000 Americans.

Almost two decades ago, medical geneticist Victor McKusick was the first to suspect that these disparate symptoms could result from a single defect in one gene of one chromosome. Mapping the gene locations for inherited diseases soon became a consuming interest: McKusick's catalog now includes nearly 6,000 entries, and is expanding at the rate of several a week.

In 1991, Harry Dietz and Clair Francomano, in collaboration with scientists at an Oregon hospital, discovered that a gene responsible for making connective tissue protein is in fact responsible for Marfan syndrome (**Figure 6**). Now Marfan patients can be diagnosed earlier, even prenatally, before symptoms appear. And beginning treatment earlier greatly increases patients' chances of long-term, quality survival.

Further research by pediatrician-scientist Dietz this year revealed a new class of proteins that could provide strategies to change the course of severe forms of Marfan syndrome and other inherited diseases. The new genetic process Dietz discovered involves a nonsense mutation that creates two genetic abnormalities: it gives the body a premature signal to stop making normal connective tissue protein, and it causes the body to produce larger amounts of a defective protein that increases the severity of the disease. Basic research such as Dietz's on how and when genetic messages are read and translated may create more opportunities to intervene at an early stage in the disease process.

Conclusion

Part of the Johns Hopkins School of Medicine mission always has been to provide a climate that inspires scientists on the research faculty to explore the mysteries of human biology at a fundamental level and to apply this knowledge to human health problems. The intellectual architect of the Johns Hopkins Medical Institutions, John Shaw Billings, summarized the Hopkins goal more than a century ago: "To give to the world men [and women] who cannot only sail by the old charts but who can make new and better ones for the use of others."

Integrating research and practice will be one of the grand challenges of the 21st century. But we will continue to reach high. As in the past, great things are expected of Johns Hopkins medicine.

American Medical Association
Physicians dedicated to the health of America

For Your Benefit

Coalition highlights the high cost of defensive medicine

The American Medical Association played a major role in a February Washington, D.C., news conference depicting the high cost of defensive medicine. According to survey data released at the conference, America could save some $36 billion over the next five years by eliminating defensive medicine practices. The National Medical LiabilityReform Coalition sponsored the conference.

A report released at the conference stated, "Defensive medicine is care that does not benefit the patient, and is provided solely to avoid malpractice claims."

The coalition's statement pointed out that any reform of the health care system must include liability reform to be complete and effective.

AMA is a major sponsor of the coalition, which includes more than 60 organizations from the business, insurance and medical sectors. Its goal: a compensation system to enhance the objective of quality, cost-effective health care available to all.

AMA presses for redefinition of expert testimony

In a friend of the court brief filed before the U.S. Supreme Court, the AMA advocates that the Court limit expert testimony to opinions founded in scientific knowledge or based on valid scientific methodology. The outcome of the *Daubert v. Merrell Dow Pharmaceuticals* case will determine the legal role of medical expert testimony.

"Expert" opinion without scientific basis has extremely negative effects on physicians, their patients and society as a whole—as well as on the legal process. The *Daubert* case involves expert testimony in product-liability suits that linked the morning sickness drug Benedectin to birth defects. Joining the AMA in this effort are 15 national medical specialty societies and the AMA/Specialty Society Medical Liability Project.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Group practice growth depicted in AMA survey

The growth of group practices is illustrated in the AMA's newly published "Medical Groups in the U.S.—A Survey of Practice Characteristics." The 1993 edition of the ongoing survey describes the current population of medical group practices and highlights trends.

This growth trend—the number of physician groups has increased by 286 percent since 1965, and the number of physicians involved by 550 percent—has major implications. AMA Executive Vice President James S. Todd, MD, says the move toward group practice "will continue to change the American system of health care delivery and make practice groups important players in any health system reform agenda."

Besides statistical data, the book contains information on governance structure, reimbursement methods, and computerization. Copies are $50 for AMA members, $70 for non-members; call (800) 621-8335 and request OP390393CH.

AMA opposes provider tax

In a letter to HCFA Acting Administrator William Toby, the AMA underscores its opposition to provider taxes—fees imposed on physicians to increase state Medicaid or other revenues.

The AMA further says that final rules on Medicaid donations and health care-related taxes should prohibit imposing "voluntary" donations on physicians on behalf of a specific health care group The current rule fails to specifically forbid coercive donations as a condition of employment or staff privilege.

AMA pledges its opposition to health fraud

The AMA is prepared to work with the government to combat fraud and abuse in the health care field. That was the message to Congress delivered by AMA Trustee Jerald R. Schenken, MD, recently.

Appearing before the criminal justice subcommittee of the Senate Judiciary Committee, Dr. Schenken said the Association strongly agrees with a General Accounting Office recommendation calling for a national commission to develop comprehensive solutions to health insurance fraud and abuse.

He outlined ongoing AMA activities in the area, including cooperation with the FBI and the establishment of a fraud and abuse hotline. The AMA also supports changes in antitrust laws to eliminate barriers to medicine's ability to expand its professional self-regulation and enforcement role, Dr. Schenken told the panel.

Prepared by the Department of Communications Services. For information, call 800 AMA-3211, ext. 4416.

Hopkins implements innovative medical school curriculum

Catherine DeAngelis, M.D.

Dr. DeAngelis is professor of pediatrics, the associate dean of academic affairs, and coordinator of the new curriculum program at the Johns Hopkins University School of Medicine. Her report is based on a lengthy article that appeared in the 1992 fall issue of Hopkins Medical News.

Photos by Bill Dennison.

The Johns Hopkins University School of Medicine has embarked on an unprecedented revision of the curriculum for medical students. The mission, financed in part by a $2.5 million grant from the Robert Wood Johnson Foundation, is to educate physicians capable of meeting the challenges of the 21st century—advancing technology, a shifting economy, a changing demography of the population, and the legion of changes in medical perspective spawned by scientific discoveries.

How it came about

In 1987, a committee chosen by then-Dean Richard S. Ross, M.D. submitted a report on the state of the medical school curriculum. The Brieger Report, named for the committee chairperson, Gert Brieger, M.D., pinpointed broad areas where change would be crucial if Hopkins wanted to be in the forefront of medical education as the medical school's second century neared.

This plan was tabled for a few years to await the impending new dean and administration for the school. In 1990, under the leadership of Dean Michael M.E. Johns, M.D., the faculty again reviewed the status of medical education and began to plan for changes.

In 1987, the Robert Wood Johnson Foundation (RWJF) embarked on a review of medical education in the United States. "We hadn't been involved in medical education before," says Annie Lea Shuster, a senior program officer for the Princeton, New Jersey, philanthropic organization, "but we couldn't seem to overlook this."

The foundation commissioned interviews with 50 of the most prominent individuals in American medicine about the country's major health problems. Medical education was mentioned often.

The findings

The foundation then surveyed deans and department directors in 127 US medical schools, and the respondents agreed that

improvement in medical education was in order. The four problem areas identified were

1. emphasis on research and patient care at the expense of teaching,
2. not enough integration between basic science and clinical teaching,
3. hospital-based clinical training that does not follow patients through the course of an illness, and
4. teaching style that does not engender development of faculty role models or give students lifelong problem-solving skills.

The foundation then offered a $150,000 planning grant to 12 schools that would match its criteria for change. Thereafter, the 8 most competitive of those 12 would receive a larger grant to implement their plans.

Grant speeds timetable

By 1991, we were going to begin our changes with or without outside money, but when we compared our proposed plan with what RWJF wanted, there was so much overlap that we decided to compete for the grant. In 1992, Hopkins received the $2.5 million grant that has certainly speeded up our timetable.

Administrators and faculty members, especially those teachers of first-half courses, have devoted a tremendous amount of time on how to create the needed change. Students also were asked to share in the revision. Representatives from all four classes offered opinions. As a result, Hopkins is in the forefront of needed change in medical education—change that assures us of a second century of excellence in teaching, research, and patient care.

Formal lectures cut back

A major reorganization in instruction is under way. The lack of formal classes in the afternoon, the limiting of lectures by 50%, and the vast increase in small group sessions are some of the curriculum changes. Unlike earlier students, the first-year students' initial clinical experiences begin in the first week of the first year of classes. More outpatient experiences and use of computers and videos are other significant changes. Faculty will phase in the new curriculum year by year as the class of 1996 progresses, making needed adjustments as they go.

At Hopkins, we do not believe that "if it ain't broke, don't fix it." Our philosophy is that it is not sufficient to be somewhere on the arrow pointing the way. We want to be at the very point of the arrow.

We are not abandoning our entire traditional curriculum. There are wonderful aspects that we want to maintain—the components that have allowed us to educate outstanding physicians for a full century. Because of the type of students we attract at Hopkins—they are brilliant and creative—it is tempting to sit back and say, no matter what we do with them, they will learn. We cannot be satisfied with that complacency. We need to build on the students' brilliance and creativity to assure that we will continue to develop leaders in American medicine.

More informed physicians

The medical school also needs to adapt to the fast-evolving world of medical practice, research, and administration, which has changed substantially in the last decade and will certainly continue to change in the foreseeable future. These changes have produced a great deal of stress in medicine, which has, to a great degree, led to our curriculum change.

The outcome should be physicians in better touch with medical advances because of their sharpened ability to understand and thus absorb information in scientific publications. In other words, physicians will have a better grasp of how science applies to the practice of medicine. The new physicians

should have greater awareness of the social, political, and ethical issues of medicine, and consequently possess the philosophical groundwork for making difficult ethical decisions.

The strategy

How do we propose to do this? One of the most basic changes involves introducing patient experiences with community-based physicians from the very beginning. It has been traditional for students to learn the basic, or preclinical sciences, before the clinical. This separation creates the impression that the basic and clinical sciences are loosely related. Unfortunately, the basic sciences are often seen as something to "get through" to reach the "real stuff" of medicine.

A considerable **natural** inclusion of clinical aspects into basic sciences has occurred. Thomas Pollard, M.D., director of cell biology and anatomy and coordinator of the basic science aspects of this first-year curriculum, says this is because of "a wonderful proliferation of understanding of how disease works at the most basic, or molecular, levels." For example, lecturers can describe normal transport processes in cell membranes by citing the latest research on what goes awry in cystic fibrosis.

Patients play a role

But the effort to include clinical aspects into basic sciences does not go far enough. "The clinical material isn't always as nicely focused or tied to patients as it could be in the first year," Dr. Pollard says, "so one thing we're initiating is a part-clinical, part-basic, science seminar on Friday afternoons. We present a patient with a particular clinical problem that ties in all the basic science concepts students get in a particular week. If, say, we've been teaching about motor system control, we might have a patient with myasthenia gravis." Students begin to understand how basic didactic work affects what happens to the patient.

The new *Introduction to Clinical Medicine* program, a program that links each first-year student with one of 60 local community physicians, augments these seminars. It is hard to believe that we have graduated some students who have never spent any time inside a private physician's office except as patients themselves.

Every other week, students spend an afternoon observing physician role models in their offices, absorbing how they relate to people and how a good practice works. The physicians involved in this experience accentuate how a medical problem affects the patient's entire life.

A new course

Medicine does not exist in a social vacuum. Even the one-on-one doctor-patient relationship is based on important concepts of population and community. The physician and resources under his or her direction are a public trust that carries obligations to the physician's community and to society as a whole. This is the essence of a new four-year longitudinal course—*The Physician and Society (PAS)*. The course blends medical ethics with the history of medicine, sociology, law, economics, and literature. "Other schools may have short courses on such topics, but none that approach the scope of a four-year comprehensive one," says Leon Gordis M.D., chairperson of epidemiology and course coordinator.

"The blending of ethics and history makes sense," Dr. Gordis says, because "a lot of ethical issues that confront physicians have emerged as medicine and technology have advanced. If we're creative, we should be able to teach ethical issues in the context of the various stages of medical history."

"Golden opportunity"

"There's also a golden opportunity for *PAS* topics to enhance what students are getting in other courses," Dr. Gordis adds. "When they're studying embryology, for example, it's a good time for *PAS* faculty to address causes of congenital malformation, how to prevent them, the family impact of a disabled child, and challenging issues related to genetic screening."

PAS meets two hours a week during the first two years. One hour is lecture; the second, a small group discussion. As clinical rotations begin, the course will be incorporated into that aspect of the students' experiences. At that point, the small group process will focus on patient-oriented topics. Topics for the entire course include patient confidentiality, ratio of benefit to harm for patients, patient rights (including the right to die and rights of the severely impaired), organization and financing of health care, economics of clinical practice, cultural aspects of health care, disease prevention, and problems of health care delivery.

A study of medical art, drama, fiction, and essays is also included in the course. "The perspective you get from non-physicians looking at medicine and patient problems is one not often seen in medical schools," says Dr. Gordis.

Feelings and attitudes

Clearly, the emotional and social aspects of life are key components of doctoring. A physician could be the best medical mechanic in the world and have all the book knowledge available, but if the physician cannot relate to the patients in their own environment, he or she is a very poor physician. Thus, much of the course is linked to feelings and attitudes, while providing a rational and ethical basis for decision making. The idea, Dr. Gordis says, "is to provide a rigorous scientific base of knowledge and superimpose on it our individual reactions," so students can fit issues such as abortion in a larger, more balanced framework.

"Traditional graduate schools treat students like adults; medical schools typically have not," says educational psychologist John Shatzer, Jr., M.D. He recently came to Hopkins with the mission of keeping the medical school abreast of contemporary teaching and evaluation techniques.

"Most medical colleges have been glorified undergraduate schools—very regimented, with a lecture-exam-lecture pattern in the first half," he adds. "Then there's great floundering for about six months in the second half' when students are expected to mature suddenly and apply what they have learned to patient wards.

Graduate schools do have seminars and other opportunities for students to show that they can absorb information and think creatively about applying it from the start. Students discover what they need to know and set about finding it themselves—precisely the attitude Hopkins hopes to nurture. Faculty members are now engineering bridges for the grade- and test-oriented undergraduates who enter medical school to cross in order to help them become mature lifelong learners.

More unstructured time

"Students need more unstructured time to take more responsibility for their own education," Dr. Pollard says.

"They start out highly enthusiastic and motivated, but that tails off because they have too much to do. They've had as many as five lectures a day in the first year, which leaves them with little time to read their textbooks. They're lucky if they do half of the assigned reading each week. So we've decided on no more than two lectures a day, interspersed with small group sessions. Everything finishes at 1 o'clock."

One solution to the constrained daily time problem is an extended school year—from 36 weeks to 39. The last part of the first year ends with an organ systems approach to understanding more functions. This will provide the transition to the second year, primarily abnormal function, which will be taught entirely by organ systems.

Last fall, pediatric cardiologist Langford Kidd, M.D., director of the second-year curriculum changes, met with the key faculty coordinators of the second year in a marathon Saturday appraisal of their course. They discovered some oversights and some overlap, Dr. Kidd says.

"No communication"

In the second year, for example, "the three major courses—pathology, pathophysiology, and pharmacology—have sailed along like great battleships," says Dr. Kidd. "They're good courses, highly thought of by students, but there's been practically no communication between them. So students might get cardiac pathology, cardiac pathophysiology, and cardiopharmacology in each of the respective courses. And this is wasteful."

Dr. Pollard found, in a separate session, "remarkably little redundancy" in the basic sciences, but discovered that major topics, notably genetics and molecular and cellular developmental biology, were not included.

"Until recently," says Dr. Kidd, "the sciences have been divided into a lot of little baronies—an anatomy department to teach anatomy, physiology to teach that course. But now, all those sciences are doing the same thing—molecular biology—because that's where questions are being answered these days. Yet our teaching has reflected the old divisions.

"Our new plan is to design a unified whole course, planned from the ground up, but at the same time respecting the disciplines that are there." When students learn the cardiovascular system, for example, histologists, physiologists, immunologists and anatomists will cycle in and out of the lectures and labs, giving their unique perspectives on, say, the heart. No more set physiology, histology, or other courses.

"This is much more logical," agrees Dr. Pollard, "and we believe it will raise student mastery of the fundamentals. In addition, with the time it frees up, students will be able to read more. We'll be able to teach at a higher level, and they'll be more responsible for learning."

More research reading

Students read one journal article per week and discuss it in small groups. Both a clinical researcher and a basic scientist are present in each of these groups. The journal article of the week is one related to that week's basic science topics. The students critique and discuss the article with the faculty acting as consultants and mentors. Students learn early how to critically review medical literature, which is a key method of continuing their education throughout their lives.

Consolidating exams

Another alteration of the curriculum involves examinations. Integrated courses, such as the first-year *Molecules and Cells,* which involves five departments teaching one course, require integrated tests and grades. Each department contributes questions to the examination, but one grade is given. Another change is that examinations are given at times less likely to interfere with other courses and more in line with the student's study time. In addition, many tests are now open book, which is much more like the way a physician functions, rather than having students simply memorize facts.

While traditional paper-and-pencil tests efficiently measure learning in the basic sciences, "there's a lot of evidence that we need more than that in other courses," says Dr. Shatzer. "Faculty typically make their inferences about students by the products they see—the write-ups, case presentations, bedside discussions of what they know about the patient."

"It's absolutely surprising," Dr. Shatzer says, "how seldom students in medical schools are observed in direct interactions with patients. If we ask residents, 'What has been lacking in your medical education?,' we invariably get: 'I've never been observed taking a complete history and physical examination.'"

More student feedback

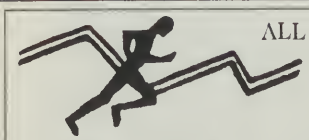
"The other area of general neglect is in providing feedback to students. Grades are just a tiny way of viewing students; grades don't say much about student strengths or weaknesses. For that, you need more direct student-faculty conferences. Yet it's often very difficult for a faculty member to face students and say, 'you're doing this very well, but you have weaknesses here.'" Dr. Shatzer hopes to develop strategies for conferences so faculty can effectively tell students what they desperately need to know.

A new clinical teaching center also will help, Dr. Shatzer says. In 10 rooms equipped with video cameras, students will be able to observe themselves and others in patient interactions. "It's one of the most powerful agents for change that a student can have," says Dr. Shatzer.

"Construction" in progress

The students' clinically based time is still being constructed. We will provide more ambulatory experiences. The pattern of exposing students to a random assortment of extremely complicated patient problems, or to those patients who are in the hospital for short periods of time with all tests prescheduled, provides a skewed teaching situation. We also are planning a specific generalist experience for all students. Finally, the reintroduction of basic sciences into the clinical years, especially the last part of the fourth year, is another challenge.

Faculty also scrutinized



During all this change, the faculty have come under scrutiny as well. We have changed policies for promotion, and now have statements in the faculty policies and procedures manual on the importance of teaching for faculty advancement.

The immediate faculty effect is one of enthusiasm. "Everybody's gotten a big charge out of this," says Dr. Pollard. "We've never done anything quite like this before—never met as such a large group with a common goal—and the attitude is very positive and the commitment strong.

In summary, we do not want to teach medical students what to think, but rather how to think. Also, we are creating an atmosphere and a daily routine that are more humane and more stimulating than any we have had—a system that will sustain the students throughout their careers.

THE FACTS ABOUT MRI IN BLACK AND WHITE.

Independent tests and physician reports confirm that MR images generated by a 1.5 Tesla MR system are of a higher resolution and superior quality than those produced by an open-air, low-field system.

At the MRI Center at Saint Joseph Hospital, we believe in giving physicians and patients the best diagnostic imaging services available anywhere. Which is why our facility features a General Electric 1.5 Tesla MR system.

Better images result in better diagnoses. And that's what we're here to provide.

A Century of Biomedical Science at Johns Hopkins: An interview with Dr. A. McGehee Harvey about this historic publication

Victor R. Hrehorovich, M.D. with Kelly White

ABSTRACT: *Research achievements at the Johns Hopkins School of Medicine over the past century are too numerous to document in anything but a catalog. But a group of Hopkins physicians and researchers compiled a representative sample of papers documenting the intellectual history of the institution, reproducing them in a two-volume text. A discussion with one of the editors, A. McGehee Harvey, M.D., offers some insight into the process of selecting papers to be included in this historic publication.*

Dr. Hrehorovich is editor of the Maryland Medical Journal. *Ms. White is managing editor of* Straight Forward.

As an expression of the Johns Hopkins School of Medicine centennial celebration, a decision was made to reproduce 100 of Hopkins' historical scientific papers in a two-volume text. A committee was formed to sift through documents dating from 1881 to the present and compile a representative sample of papers detailing the evolution of this institution's contributions to medicine. The committee—A. McGehee Harvey, M.D., chairperson; John L. Cameron, M.D.; M. Daniel Lane, Ph.D.; Guy M. McKhann, M.D.; Victor A. McKusick, M.D.; and Paul Talalay, M.D.—spent two and a half years putting these volumes together. Each article is reprinted in its original format, prefaced by commentary by the committee.

What follows is an interview with the chairperson of this undertaking, Dr. A. McGehee Harvey, conducted by Dr. Victor R. Hrehorovich, editor of the *Maryland Medical Journal.* Italicized are excerpts from the two-volume publication titled, *A Century of Biomedical Science at Johns Hopkins.*

Q: How did the idea of republishing these documents develop and how were the articles selected?

A: A number of individuals thought the biomedical science conducted at Hopkins had not been presented in a way that displayed Hopkins' contributions over the century. As Hopkins was celebrating the medical school centennial, it seemed like a good time to do it. It was thought that reproducing the articles with a commentary on the impact each had had on medicine would give people an opportunity to see what has been accom-

plished here and learn how each discovery ultimately fit into the scheme of medical advances.

The objective was to have the books provide an intellectual history of the institution. It was important, the members of the committee thought, to pick out not only the most complex, technological discoveries or those by full-time scientists working in the laboratory, but to include discoveries contributed by students, clinicians, fellows, and trainees—that is, from each level in an intellectual environment where additions to knowledge were primary goals.

The committee identified certain landmark papers that should be included, but also consulted numerous faculty and all department heads for their suggestions. The committee's goal was to include outstanding representative studies. It would have been impossible to identify the 100 best papers. By choosing representative articles, we gave ourselves a little leeway. Some of the papers we looked at were very lengthy with many photographs. So sometimes we had to choose articles that were less lengthy, but just as representative. We also tried to see that all eras and all departments were represented. I'm sure that if another group of six people got together, a certain percentage of the papers would be different, but just as representative.

Q: When you're dealing with such a broad spectrum of activity over 100 years, it's hard to draw any generalizations as to what promotes excellence. But can you identify any common feature that makes the chosen papers different from others?

A: I don't think there's any common feature, and I think that illustrates the diversity of interests in a medical center such as this. One thing that always impresses me is that it's impossible to know the ultimate importance of a given discovery. Take the concept of tissue culture: I don't think anybody at the time it was developed appreciated the impact tissue culture would have. Many of the early tissue culture studies evolved here at Hopkins, and the articles in these volumes well illustrate that. For example, the Lewises' studies defined tissue culture technique, so that one could study quantitatively the physiology and various other aspects of cell growth. Then George Gey came along and isolated the HeLa cell strain, which became the standard tissue culture strain in laboratories all over the world. Tissue culture has been involved in just about anything you want to name—vaccines, pharmacology, genetics—almost any field.

"Having found that tissues from chick embryos grow readily in artificial media, nutrient agar and bouillon, the next step was the attempt to cultivate such tissues in media all the constituents of which are known. In collaboration with Dr. Arthur Koelker we were able to obtain excellent growth in combinations of amido-acids and polypeptids of known constitution, in Locke's solution. Locke's solution with maltose and dextrose was then tried with such good results that Locke's solution was attempted with the very startling discovery that these embryonic tissues grow readily in the Locke's solution and various combinations of NaCl, $CaCl_2$, KCl, and NaH CO_3...."

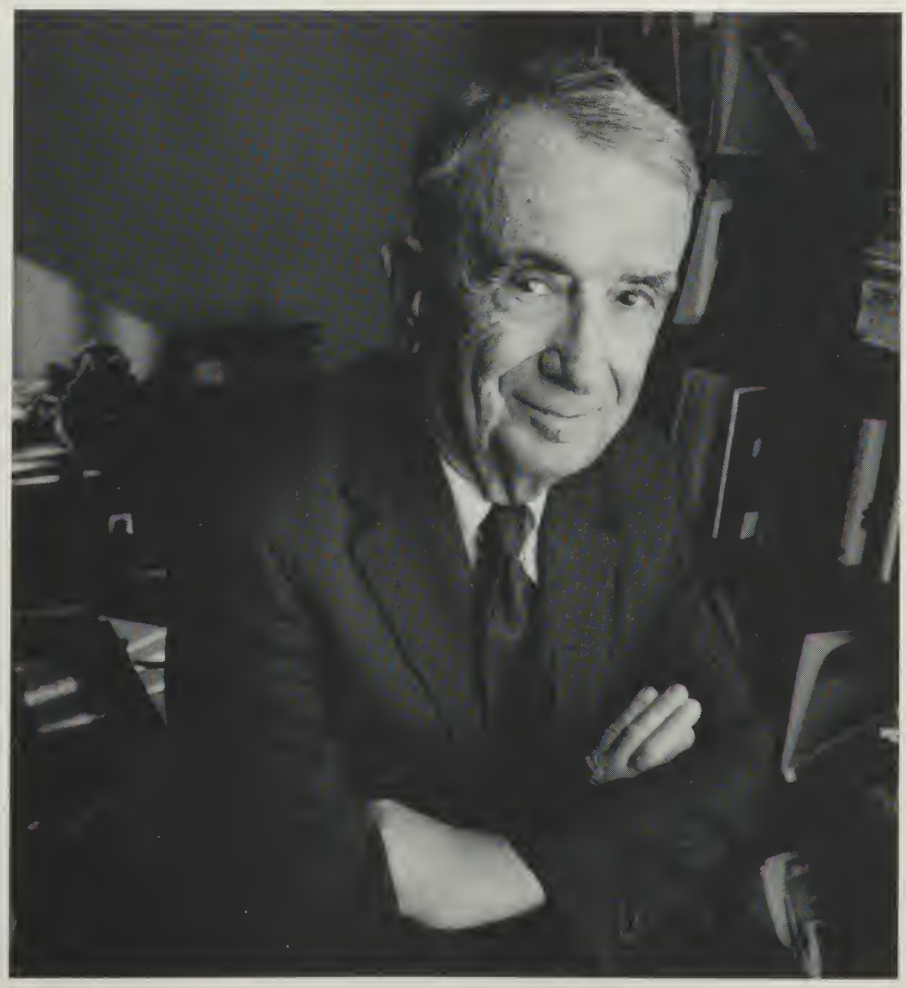
(Lewis MR, Lewis WH. The cultivation of tissues from chick embryos in solutions of NaCl, $CaCl_2$, KCl and $NaHCO_3$. *The Anatomical Record* 1911; 5(6):277–93.)

"This is a report of an evaluation in vitro *of the growth potential of normal, early intra-epithelial, and invasive carcinoma from a series of cases of cervical carcinoma. Comparable cytological and tissue culture studies were actually carried out on selected biopsies of normal and neoplastic areas of the same cervix. Thus far, only one strain of epidermoid carcinoma has been established and grown in continuous roller tube cultures for almost a year. It grows well in a composite medium of chicken plasma, bovine embryo extract, and human placental cord serum. The autologous normal prototype is most difficult to maintain under comparable cultural conditions. Most of the tissue from other cases showed rapid keratinization of the cells grown in cultures whether from normal or neoplastic areas...."*

(Gey GO, Coffman WD, Kubicek MT. Tissue culture studies of the proliferative capacity of cervical carcinoma and normal epithelium. *Cancer Research* 1952; 12:264–65.)

There are many other examples in these books of research that would have a significant impact, such as the "blue baby" operation, which opened people's eyes to the potential of heart surgery; it was the start of modern cardiovascular surgery. Another example is sulfonamides, which were first used in this country at Hopkins. Dr. Marshall devised a technique for measuring them; he was a major architect of the science of chemotherapy. It was also Marshall who demonstrated renal tubular secretion.

"Heretofore there has been no satisfactory treatment for pulmonary stenosis and pulmonary atresia. A 'blue' baby with a malformed heart was considered beyond the reach of surgical aid. During the past three months we have operated on 3 children with severe degrees of pulmonary stenosis and each of the patients appears to be greatly benefited."



(Blalock A, Taussig HB. The surgical treatment of malformations of heart in which there is pulmonary stenosis or pulmonary atresia. *JAMA* 1945; 128(3):189-202.)

"...the evidence which is presented in this communication would seem to prove definitely that the elimination of phenolsulphonephthalein by the kidney cannot be explained entirely on a filtration and reabsorption theory but that the addition of a process of secretion of the substance by the convoluted tubules is necessary."

(Marshall EK Jr, Vickers JL. The mechanism of the elimination of phenolsulphonephthalein by the kidney; a proof of secretion by the convoluted tubules. *Bulletin of the Johns Hopkins Hospital* 1923; 34(383):1-7.)

The first paper in volume 1 was written by Newell Martin, who conducted his research at a Hopkins university laboratory. He was the first professor of physiology, although he didn't live long enough to actually serve after the medical school opened. He devised a technique for using the isolated mammalian heart for studies of all kinds of things; for example, the actions of drugs and cardiovascular physiology. Developing a technique for perfusing the coronary arteries was probably one of the greatest discoveries ever made in an American physiology laboratory.

Figure 1. A. McGehee Harvey, M.D., professor emeritus of medicine.

"In the course of some experiments made by me in conjunction with Dr. W.T. Sedgwick, on blood pressure in the coronary arteries of the heart, the fact was impressed upon me that the mammalian heart is no such fragile organ as one is usually inclined to assume, but possesses a very considerable power of bearing manipulation.... The above experiment...justifies no conclusions except that an isolated mammalian heart can be kept beating for several hours. It, however, suggests...that the pulse rate of the isolated heart is very independent of arterial pressure, though, as no accurate temperature observations were made in this case, the experiment by itself is not worth much in that respect."

(Martin HN. A new method of studying the mammalian heart. *Physiological Papers.* Baltimore: Johns Hopkins Press. 1895; 1–11.)

Dr. Tumulty's paper, on what is an effective clinician, is the last paper in volume 2. It illustrates that in spite of the fact that these books emphasize the scientific history of this institution, just as much importance has been attached to teaching clinical medicine and training doctors.

"A clinician is one whose prime function is to manage a sick person with the purpose of alleviating the total effect of his illness. The multifocal character of the impact of illness upon the patient and his family is stressed. Clinical evidence is the material with which the physician works, and a meticulous history and physical examination are paramount. The availability of more specific forms of therapy requires a clinician to be more of a scientist and, at the same time, more expert in clinical methods. Ability to listen and to talk, so that valid clinical evidence is gathered, anxieties are dissipated, and understanding and motivation are instilled, are the clinicians' greatest assets."

(Tumulty PA. What is a clinician and what does he do? *N Engl J Med* 1970; 283:20–24.)

There's also a wonderful article by Dr. Temkin on the role of surgery and the development of medical teaching. It shows the importance of the history of medicine. I could go on and on in terms of the various aspects of biomedical science addressed in these books. The range is so broad. I don't think there's any one lesson to learn from these articles except for the importance of creating an environment where the search for new knowledge is equally as important as teaching knowledge that already exists.

"Surgery, for many centuries, had relied on an objective anatomical diagnosis. In turning to a localized pathology, medicine adopted a point of view prevalent among surgeons. In part at least, the reorientation of medicine was due to an increasing approximation between medicine and surgery during the 18th century, with pathological anatomy and experimental physiology as a common ground cultivated by both disciplines. Because the reorientation of medicine took place within a relatively short period and led to dramatic results in diagnosis and nosology, it has impressed us more than the steady advance of surgery. And since surgery, in its practical possibilities, was still restricted until the advent of anesthesia and antisepsis, medicine has appeared as the progressive branch while surgery has seemed to lag behind."

(Temkin O. The role of surgery in the rise of modern medical thought. *Bulletin of the History of Medicine* 1951; 25:248–59.)

Q: It appears that the interchange of ideas between people within different departments and different orientations was an important stimulus to new perspectives and discoveries. Do you agree?

A: Of truly vital importance in the advance of medicine is the atmosphere in a given institution. In these books, we wanted to stress how the atmosphere at Hopkins contributed to research successes. We point out that there were originally two major research laboratories—Martin's at the university and Welch's at the school of medicine. Many who worked in Martin's laboratory later became professors in the school of medicine. The scientific base of the institution was created right in the beginning, so when the hospital opened, the atmosphere was already established. Diversity was already a part of the hospital environment; all departments knew from the beginning that the exchange of ideas between departments was one of their missions.

As Dr. Mall said, "Disease is the price of ignorance." One purpose of the medical school was to dispel ignorance and develop

new knowledge. These two books represent the intellectual history of the institution.

Q: Can you predict in what areas major advancements will be made at Hopkins?

A: The whole field of genetics is changing the face of medicine. Most people think the advances have been rapid and great in the last 100 years. It won't be many years, however, before medicine is so different that it will be hard for those of us today to recognize it. With what's going on now, the future is mind-boggling. I'm not capable of predicting what is going to happen in specific terms, but Dr. Welch made a correct prediction in the early 1930s that there were going to be tremendous advances in medicine that would make medicine unrecognizable 50 years from that time; I think that is true in spades now.

Q: What are the promising areas in terms of genetic research?

A: Two of the most important articles in these volumes are concerned with the Nobel-prize winning work of Dan Nathans and Hamilton Smith, who developed DNA technology and opened up that whole field.

There is almost no department at Hopkins that is not immersed in the search for the gene involved in one or more diseases or in mapping genes. The study of genetics is clearly going to be with us for a long time. It's amazing what one can do now based on current genetic information and what will be made possible in the near future.

"In the past 7 to 8 years we have witnessed the development of a new DNA technology that has fundamentally altered our approach to modern genetics. The basic ingredients of this new technology are the cleavage site-specific restriction enzymes: a special class of bacterial endonucleases that can recognize specific nucleotide sequences in duplex DNA and produce double-stranded cleavages. A collection of these enzymes, each with its own particular sequence specificity, can be used to cleave DNA molecules into unique sets of fragments for DNA sequencing, chromosome analysis, gene isolation, and construction of recombinant DNA. The latter, together with the concept of molecular cloning, has given birth to the new field of genetic engineering, and from this many new and exciting medical and research applications are expected."
(Smith HO. Nucleotide sequence specificity of restriction endonucleases. *Science* 1979; 205(4405):455-62.)

"As an initial experiment, I planned to survey the known restriction endonucleases for their ability to cleave SV40 DNA. On my return to Baltimore in the summer of 1969, DNA in hand, our dissection of the SV40 chromosome began.... In time it should be possible to make out the basic regulatory mechanisms used by plant and animal cells, and eventually to understand some of the complex genetic programs that govern the growth, development, and specialized functions of higher organisms, including man."
(Nathans D. Restriction endonucleases, simian virus 40, and the new genetics. *Science* 1979; 206(4421):903-9.)

Q: Over a long period of time, you have written a lot about Hopkins. Working on this particular project, has your perspective changed in any way or has it reaffirmed your previous beliefs concerning prerequisites for excellence?

A: Things have moved so rapidly since I retired I couldn't keep up with all the recent details by any means, but that's how I got interested. There has been much written about the history of Hopkins but, until recently, not so much about research and discovery. I hope people will enjoy these books. They're encyclopedic in a way. You can pick them up and get distinct detail about what somebody did without having to spend hours in the library. I found many surprises along the way myself. I recognized the importance of things I was not aware of in the various specialties. That was the nice thing about having input from various departments. Someone with knowledge in a specialized field could point out the importance of contributions that I would not be able to evaluate; I wouldn't have known the difference from the run-of-the-mill paper in some fields.

We had a lot of help choosing the papers. It's interesting that even technicians made important contributions in some of these papers. What we tried to do is show that Hopkins has always been a community

of individuals trying to improve medical knowledge and the ability to provide good medical care. I think that still exists. It is one of the unique underpinnings of this particular school; the people at Hopkins from the beginning created a sense of community and interchange. That attitude allowed one to cross departmental barriers. Interdepartmental collaboration, willingness, and openness have always been a hallmark at Hopkins.

Q: Looking at these papers, one sees different fields interacting with each other to arrive at new concepts. Is that the key to institutionalizing excellence?

A: An important advantage for students is working and studying where scientific research is in progress. As a result, students learn how to become critical of new things they encounter in the future. They aren't overwhelmed by techniques that may or may not represent a major advance. They became critical in evaluating what to do, and, as a result, become better doctors. Many Hopkins students have been stimulated to participate in research as illustrated by the fact that there are a number of papers in these volumes contributed by students.

In addition, as I mentioned before, the papers in these books don't just focus on the technical aspect of research. A number of papers illustrate new methods of training and teaching. For example, there are articles by Halsted and Osler describing their methods of teaching and another by Cushing presenting a new method of teaching students about surgical technique. Harvey Cushing established the Hopkins animal research laboratory years ago; he made it possible to teach surgery to students through actual experience.

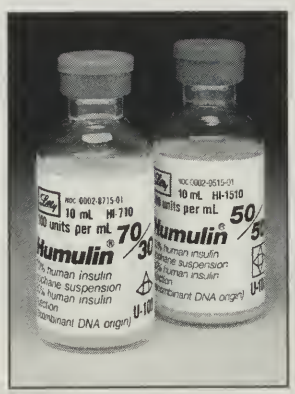
"Surgery, like other branches of the healing art, has followed in its progress zigzag paths, often difficult to trace. Now it has seemed to advance by orderly steps or through the influence of some master mind even by bounds; again it has stumbled apparently only from error to error, or has even receded; often there has appeared some invention or discovery for which the time was not ripe and which had to await for its fruitful application or perhaps its rediscovery a more favorable period, it might be centuries later."

(Halsted WS. The training of the surgeon. *Bulletin of the Johns Hopkins Hospital* 1904; 15:267–75.)

"Emphasis is laid at the same time upon the fact that the operation is not the beginning and end of surgery, but a therapeutic measure alone; and that those employing this manner of treatment must have the same knowledge of disease, the same ability to make examinations, the same instincts to follow pathological material to the laboratory and to investigate there the causes and symptoms of disease, as should characterize any other well-trained members of the body medical."

(Cushing H. Instruction in operative medicine. With the description of a course given in the Hunterian Laboratory of Experimental Medicine. *Bulletin of the Johns Hopkins Hospital* 1906; 17(182):123–34.)

Q: Looking over these papers, it appears that clinical advances occurred because of an environment that stressed the importance of research and education. Would you comment on that?



A: The creation of an appropriate environment is crucial when you run across something unusual that you had not been looking for. With the right environment and atmosphere, your mind is prepared to recognize something unusual or unexpected when you see it. Dr. Blalock's article, in which he summarizes the nature of discovery, tells it best: "The idea is the seed," said Blalock, quoting Claude Bernard. "The method is the earth furnishing the conditions in which it may develop, flourish and give the best fruit according to its nature. But as only what has been sown in the ground will ever grow, so nothing will be developed by the experimental method except the ideas submitted to it." (Blalock A. The nature of discovery. *Ann Surg* 1956; 144: 289.) ■

Two Reasons Why You Should Refer Your Patients To Accessible MRI:

1. A Medical Test Should **NOT** Scare People Half to Death!

Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 450 pounds), the elderly and children. Our team of trained professionals will help your staff provide the best care available to your patients.

At Accessible MRI we make it easier for you to diagnose your patient's problems.

T-1 Axial MRI image through the L-5 S-1 disc level. Notice the sagital insert showing exactly where this slice is taken.

2. Our Images Speak for Themselves

You don't have to compromise the quality of your images for the comfort of your patients. At Accessible MRI, your images receive the highest quality and latest state-of-the-art technology.

Our Board certified radiologists have read over 11,000 scans and are available for consultation at any time. Our professional, highly-trained staff provides the expertise and experience you demand. We are able to handle all your patients' schedule needs at either our Baltimore or Washington location.

We provide quick turnaround on all films and transcriptions. We participate with most insurance plans. Please contact our representative for further information.

The physician's role in Workers' Compensation

Workers' Compensation is a no-fault insurance program established by state law that all employers, having one or more employees, full- or part-time, are required to have. For employees to receive insurance benefits, they must have sustained an unintentional injury or occupational disease arising out of, and in the course of, employment. The cost of Workers' Compensation insurance is borne entirely by the employer.

Injured employees are responsible for reporting any unintentional injury to the employer immediately, as a delay may affect claims. If a claim is found to be compensable, weekly benefits and all medical bills related to the injury will be paid by the employer or insurer. Employees receive weekly benefits (temporary total disability payments) and full medical coverage for as long as they are unable to work due to the unintentional injury or until maximum medical improvement has been reached.

Temporary total disability payments equal two thirds of claimants' average weekly wage, not to exceed the state's average weekly wage for the year in which the injury occurred. For 1993, the state's average weekly wage is $494. If claimants are not capable of returning to their job or a comparable one for which they are qualified, they may be eligible for vocational rehabilitation and training. In the event of a permanent disability, injured workers receive weekly benefits for a specified time period based on the type and extent of their permanent disability. Benefits for workers who have been totally and permanently disabled may continue indefinitely. Medical evaluations are usually required to establish the nature and extent of any permanent disability.

Overseeing the Workers' Compensation Insurance Program is the Workers' Compensation Commission, which is self-supporting from assessments on insurance carriers. It is composed of 10 commissioners appointed by the governor. The commissioners adjudicate disputes without juries by means of a hearing process similar to the court system. Appeals of the commissioners' decisions may be taken to the Maryland court system.

Physicians and other health care providers play a role from the time workers sustain an injury until their eventual return to work or, in the event of more disabling injuries, indefinitely. The specifics of medical intervention can perhaps be best understood by answering the most frequently encountered questions received at the medical examiner's office.

▲ As a physician, do I need special qualifications to treat an injured worker?

No. In Maryland, any licensed health care provider may treat injured workers.

▲ How do I know if my patient really has a job-related injury?

The usual history taking will generally reveal if an injury has occurred. In the case of symptoms related to chronic use such as repetitive motion injuries, or certain medical illnesses, the relationship may not always be clear. In these situations, it is advisable to call a worker's employer and request authorization for nonemergency treatment. The authorization request can generally be handled by your office staff. In the event of an emergency, care as usual must be rendered.

▲ Must I treat Workers' Compensation patients?

No, not in the elective situation.

▲ For what kind of paperwork am I responsible?

The **initial** treating facility is responsible for filing a surgeon's report (form SF-2), which is available from the Workers' Compensation Commission. (Subsequent providers are not responsible for filing a surgeon's report, even if the forms are received from the employer.) Your consultation or office notes are sufficient.

▲ To whom do I send the bill?

When your office staff secures authorization for treatment, he or she should ask to whom the bills should be sent.

▲ Do I have to send my consultation or office notes with the bill?

It is not mandatory, but more and more insurance companies request the documentation, and, generally, it will speed payment of your bill.

▲ Must the bill be sent on any particular insurance form?

Most companies will accept HCFA (Health Care Financing Administration) 1500 forms, super bills, or various computer-generated bills.

▲ Is CPT coding necessary?

Yes. No bill will be considered for payment by any insurer without proper CPT (current procedural terminology) coding, including modifiers.

▲ If I get authorization to treat a patient in my office, and surgery or other complex treatment is necessary, will the initial authorization suffice?

Not necessarily. If surgery is indicated, your office staff should always ask whether additional authorization is required. Similarly, for prolonged treatment plans, such as multiple procedures or other reconstructive or rehabilitative treatments, it is wise to obtain authorization **in writing**, outlining your program and fees, especially if they exceed those listed in the *Maryland Fee Guide.*

▲ **Does Maryland have a fee guide?**

Yes. Employers and insurers are required to pay at least the fees outlined in the fee guide. Unusual services should be explained using standard modifiers. A copy of the *Maryland Fee Guide* costs $6 and may be obtained by contacting the Supply Division of the Workers' Compensation Commission at 410-333-4754.

▲ **I sent the insurer a bill three months ago for a routine service and have not heard anything. What should I do?**

Generally, if you have not received payment on a Workers' Compensation claim in six to eight weeks, you should contact the insurer for an explanation; your bill may not have been received, a CPT code might be awry, documentation might be necessary, or the claim might be being contested.

▲ **How can the payment for the claim be contested if I received authorization for treatment prior to treating the patient?**

In rare cases, claims the employer thought were work related, are found by the insurer to be non-work related. In these situations, a claimant's health insurance company would be billed instead of the Workers' Compensation insurance carrier. The reverse also happens; a worker may be unaware that the injury or illness being treated is actually work related, and billing, which was initially sent to the health insurer, has to be rebilled to the Workers' Compensation carrier. In this latter situation, any payments received from the claimant's health insurer must be returned.

▲ **I received payment that is less than the fee schedule, and the insurer says it is correct. What should I do?**

Usually, the *Maryland Fee Guide* will show who is correct. The fact that you generally receive a certain level of payment from many insurers does not mean that the payment in dispute is inappropriate. Many physicians do not even have a copy of the fee guide in their office and have no idea what the correct level of payment is for any given CPT code. If the insurer has truly made an error, there is generally no problem in having it corrected. An unresolved dispute with the insurer may be referred to the medical examiner's office on a C-51 form. These forms are available from the commission by calling 410-333-4734.

▲ **The fee allowance for my procedure was B.R. (by report). I sent a report and the carrier still paid less than my fee. What do I do?**

This is a gray area as the provider is always certain that the fee is appropriate, and the insurer has a wealth of data on how much of a payment to make. A conversation with the insurance claims supervisor may resolve the dispute. If not, a C-51 form sent to the medical examiner's office will generate a review.

▲ **I sent in one code to the insurance company. It was downgraded and I was paid less. Can the carrier do that?**

Your documentation must support the level for which you bill. When it does not, the insurer may downgrade your code and payment accordingly. Again, discussion with the insurer may resolve the problem.

▲ **Insurers are using the new E/M codes for office visits. When will Workers' Compensation adopt these new codes?**

The *Maryland Fee Guide* is updated biannually, with the next one due out in August 1993. Med Chi has been contacted to assist in the transition to the new E/M codes, and they will be in the new fee guide.

▲ **If I send a bill to the insurer and I do not agree with the payment, can I balance bill the patient?**

No. It is against the law.

▲ **If I send a bill to the insurer and I do not agree with the payment, what appeal process exists?**

The easiest mechanism is to file an appeal on a C-51 form, which is sent to the medical examiner's office of the Workers' Compensation Commission. Sometimes a question can be settled by a phone call. The next level of appeal is a hearing before one of the commissioners, and, finally, an appeal can be taken to the Maryland court system. The latter has been done on three or four occasions, and the courts always found in favor of the defendant (i.e., the insurer). This, therefore, is not recommended as a productive avenue of appeal.

▲ **If I examine and treat or evaluate an injured worker, will I have to testify at the commission or in court?**

Routine treatment rarely generates a controversy requiring court testimony. For those providers conducting independent medical examinations (IME) to establish the nature and extent of permanent disability, the possibility of court testimony increases. This frequently can be avoided, however, by giving a video deposition at your office, thereby decreasing significantly any inconvenience for you.

▲ **Are evaluations for the purpose of IME made strictly on the basis of the AMA guide to impairment?**

No. The legislature has added to the evaluative process consideration for loss of endurance, weakness, pain, and

▲ **Insurers are using the new E/M codes for office visits. When will Workers' Compensation adopt these new codes?**

The *Maryland Fee Guide* is updated biannually, with the next one due out in August 1993. Med Chi has been contacted to assist in the transition to the new E/M codes, and they will be in the new fee guide.

▲ **If I send a bill to the insurer and I do not agree with the payment, can I balance bill the patient?**

No. It is against the law.

▲ **If I send a bill to the insurer and I do not agree with the payment, what appeal process exists?**

The easiest mechanism is to file an appeal on a C-51 form, which is sent to the medical examiner's office of the Workers' Compensation Commission. Sometimes a question can be settled by a phone call. The next level of appeal is a hearing before one of the commissioners, and, finally, an appeal can be taken to the Maryland court system. The latter has been done on three or four occasions, and the courts always found in favor of the defendant (i.e., the insurer). This, therefore, is not recommended as a productive avenue of appeal.

▲ **If I examine and treat or evaluate an injured worker, will I have to testify at the commission or in court?**

Routine treatment rarely generates a controversy requiring court testimony. For those providers conducting independent medical examinations (IME) to establish the nature and extent of permanent disability, the possibility of court testimony increases. This frequently can be avoided, however, by giving a video deposition at your office, thereby decreasing significantly any inconvenience for you.

▲ **Are evaluations for the purpose of IME made strictly on the basis of the AMA guide to impairment?**

No. The legislature has added to the evaluative process consideration for loss of endurance, weakness, pain, and

atrophy, in addition to the more standard areas of loss of function and range of motion. This, unfortunately, makes the determination more subjective.

▲ **I have been told that the review process at the medical examiner's office is significantly backlogged. What is the current status?**

The medical examiner's office has had, over the years, a considerable number of C-51 forms to review, and only recently has been able to obtain help with the review process. The current backlog should be completed with the help of outside vendors by April 1993.

▲ **My patient's lawyer says send him the bill and he will take care of it. Should I?**

Send the bill to the insurer and deal directly with the insurer. Lawyers may require medical records and a copy of the bill in support of your patient's claim. Generally, there should be no problem sending the material at routine costs involved in copying. If a narrative is requested, appropriate additional charges are reasonable.

▲ **My patient wants release slips for going back to work. Do I have to fill out this additional paperwork?**

Most patients cannot return to work without a release slip from their treating physician. Failure to provide this can jeopardize a claimant's employment and cause legal proceedings to be brought against the treating physician.

▲ **My patient really needs a surgical procedure and the insurer is dragging its feet. What can I do about this?**

There is an emergency hearing format for this situation with which your patient's lawyer should be familiar. Such hearings can be scheduled within 14 days. If your patient is not represented, tell the patient to contact the Workers' Compensation Commission at 410-333-4704 or 333-4261. (The toll-free number within Maryland is 1-800-492-0479.)

▲ **I believe that certain fees in the fee guide are inappropriate. When does the fee guide get reviewed?**

Recommendations are made to the Workers' Compensation Commission biannually based on monthly hearings held by the Medical Fee Guide Committee during the intervening two years. The commission conducts public hearings on proposed changes and, following the hearings, adopts the fee guide as per agency regulation in accordance with state procedures.

▲ **How is the multiple procedure rule used in the *Maryland Fee Guide?***

You should file your procedures according to expense, with the highest paying procedure listed first. It will be paid according to the fee guide at 100% for the most expensive procedure, 75% of the cost of the next most expensive procedure, and 50% of the cost of all additional procedures performed at the same time.

▲ **I looked in the *Maryland Fee Guide*, and it does not have the CPT code for the procedure I performed.**

The fee guide is updated every two years, and the CPT codes are published annually. Consequently, the *Maryland Fee Guide* is unable to publish the most recent codes in the AMA guide. The most recent codes have no relevant fee structure developed for them and, even if they could be included in a timely manner, there would not be a basis to assign fees for the newer procedures. In addition, some procedures that would rarely involve compensable claims, such as pediatric or gynecological procedures, have been purposely omitted. The absence of a procedure in our fee guide does not absolve the insurer from the responsibility for providing payment for that procedure. It does, however, present a problem when the provider and the insurer cannot agree on the appropriate payment for the procedure. When this occurs, the appeals process outlined above may be used.

▲ **Does the fee guide pertain if the Maryland worker is injured out of state?**

Yes. The fee guide is in effect for the payment of any bill for a worker employed by a Maryland-based company. The patient, again, is not responsible for any bill balance not paid by an insurer.

▲ **Where do I obtain the AMA guide to *The Evaluation of Permanent Impairment?***

The book may be obtained from the AMA by calling 1-800-621-8335.

▲ **Is there a statute of limitations on a Workers' Compensation bill?**

No. There is no limitation. A bill can be filed at any time subsequent to the performance of the provider's service.

I hope the above remarks have given you some insight into the physician's role in the Workers' Compensation process. As this is an overview article, there may be specific questions that you or your office staff have regarding Workers' Compensation. The medical examiner's office welcomes these questions at any time. Please call 410-333-4709.

NEIL A. ROBINSON, M.D.
Dr. Robinson is a practicing general surgeon in Baltimore, Maryland, and medical examiner for the Maryland Workers' Compensation Commission. ■

Workers' Compensation: A physician survey

The Med Chi Committee on Managed Care and Third-Party Liaison has received a significant number of complaints concerning Workers' Compensation over the years. We hope that Dr. Robinson's article has helped, but we are also trying to monitor and resolve some of the problems. In this context, we are asking you to take a few minutes to fill out this questionnaire and send it back as soon as possible.

Please type or print ***clearly.***

Update on Blue Cross and Blue Shield of Maryland

The appointment of William L. Jews as the new Blue Cross and Blue Shield of Maryland (BCBSM) president and CEO (chief executive officer) became effective on April 1. This occurrence, however, was not the only event to bring the state's largest nonprofit health insurer to the public's attention during March and April. Other reported issues included several law suits filed against current and former company executives, BCBSM's proposal to the insurance commission to collect cost-saving data through InforMed, and the fate of Insurance Commissioner John A. Donaho in his efforts to gain tighter control over the Blues.

Law suits

In the autumn of 1992, a United States Senate subcommittee reported that BCBSM had lost $120 million as a result of mismanagement, excessive executive spending, and misdirected subsidiary business ventures. The report set the resulting loss in subscriber funds at $120 million.[1]

On March 23, Attorney General J. Joseph Curran, Jr., urged the directors of BCBSM to investigate whether the corporation should sue several of its former executives. He cited the contents of the US Senate subcommittee report and information gathered by private attorneys as the basis for his recommendation to the BCBSM directors. Mr. Curran indicated that law suits from other sources were imminent and that the corporation has the best legal standing to sue. His request to the directors is a preliminary step before any outside party can file suit.[1]

A day after Mr. Curran's request, two attorneys, representing what they described as a cross section of subscribers, also asked Blue Cross directors to sue former executives for gross mismanagement.[2] In response to this request and to Mr. Curran's request, the directors of BCBSM hired the Washington law firm of Kirkpatrick and Lockhart to conduct an independent investigation. Based on the findings, the directors intend to decide whether to pursue a lawsuit.[3]

On March 31, 1993, the two private attorneys filed suit against 10 current and 8 former executives on behalf of five subscribers. The law suit charges the defendants with gross mismanagement, negligence, personal use of corporate funds, and breach of trust. The suit also names the consulting firm of Booz, Allen & Hamilton, Inc. as a defendant. BCBSM itself is not a defendant in this suit. If successful, the plaintiffs intend to return the $145 million dollars sought by the suit to company funds.[4]

BCBSM year-end review

In April 1992, BCBSM issued a *Report to Our Customers: A Fourth Quarter Report and Year-End Review of 1992* in an attempt to keep its 1.4 million customers well informed. The report summarized money earned and spent including, at year end, $1.46 billion received from customers, $1.27 billion paid for health care expenses, $158.4 million paid to administer benefits, and $40.8 million added to the surplus.

The report went on to highlight fourth quarter initiatives in six areas.

1. BCBSM improved its financial position by reducing the number of active subsidiaries and administrative expenses, eliminating certain marketing expenses, and beginning a review of the expenses associated with its Owning Mills buildings.
2. Administrative expenses are expected to fall below those of 1992 due to the elimination of some marketing expenses, centralization of key internal staff areas, a decrease in the use of consulting services, a freeze on hiring, and a tightening of controls on executive compensation packages.
3. To improve its National Management Information System rating, which measures the effectiveness of customer service, BCBSM reassigned employees to service areas, redesigned work flow, increased management attentiveness to service delivery, signed a contract with Electronic Data Services to increase submission and improve accuracy of electronic claims, began a collaboration with the Maryland Hospital Association to develop pilot technology projects to speed up claims processing, and began addressing claims processing, quality assurance, Medicare secondary payer, and service performance.
4. To improve communication with all its constituencies, BCBSM began publishing quarterly reports for customers and regular submission of claims, subsidiary, and BCBSM information to the Maryland Insurance Division.
5. The board separated the roles of CEO and chairperson to better maintain a system of checks and balances in the company. The CEO now reports to the chairperson and, ultimately, to the BCBSM Board of Directors. To increase oversight of operations, the board formed three new committees: Finance, Public and Community Affairs, and Claims and Service.
6. A new senior management structure, designed to simplify reporting relationships and increase accountability, was established.

The report also summarized BCBSM's community involvement, stating that no more than 2% of its pretax income goes to charitable cash contributions. The report closed with highlights of BCBSM's base business and subsidiaries, and a summary of new products. Free copies of the report may be obtained by calling 410-998-5730. ■

BCBSM responds to physicians' questions

On February 24, 1993, BCBSM executives, including Frank A. Gunther, Jr. (board of directors chairperson), Arthur T. Keefe, Jr., M.D. (then vice president and corporate medical director), and William Beasman (acting chief executive officer), spoke to Med Chi physicians at a meeting held in Osler Hall (see From the Editor's Desk. *Md Med J* 1993; 42(3):299-300). At the meeting's conclusion, the BCBSM executives urged physicians who had not had the opportunity to pose questions to submit them in writing. Following are BCBSM's responses to questions submitted by the Maryland Chapter of the American Academy of Pediatrics.

Q: What research did BCBSM do prior to implementing 24-hour discharge that indicated it was safe for mother and baby?

A: The target lengths of stay for maternity admissions were developed after careful evaluation of both local and national admission data. Our research revealed that the trend for admissions for **uncomplicated vaginal delivery** had been decreasing such that the average length of stay in Maryland hospitals in 1990 was barely two days. By 1991, the length of stay continued to decrease, and during that year, a number of hospitals already were employing a one-day length of stay target. In fact, there are several hospitals that in 1991 and through the present, do not routinely admit patients at all if their vaginal deliveries have been uncomplicated.

With respect to national length of stay norms for obstetrical delivery as well as other medical conditions, MMS uses the Western Region of the Professional Activities Survey (PAS) data as a guide. These data, which are compiled from hospitals across the United States, reveal that since 1989 the average length of stay for **uncomplicated vaginal delivery** has been one day.

Please bear in mind that our target length of stay of one day is for uncomplicated vaginal deliveries only.

Q: How many deliveries have there been since this policy was implemented?

A: We do not have these data available at this time.

Q: What is the average savings per delivery for reduction of two hospital days?

A: Prior to implementation of our target of a one-day length of stay for uncomplicated vaginal delivery, the average length of stay for such admissions was two days. Hence, **any savings would relate to one day per admission**, at an average rate of $700 per day (mother's and baby's room/board combined).

Q: What is the total amount of money not paid out by BCBSM since the inception of this policy?

A: Data not available. In any event, it would be difficult to determine whether admissions of one day (or no hospital admission at all) for uncomplicated vaginal delivery are due to the existence of BCBSM's length of stay (LOS) target or are due to patient preference/physician practice.

Q: What is the total amount of money not paid out by BCBSM per year?

A: Data not available.

Q: What is BCBSM reimbursing GBMC/Diversified for each newborn visit?

A: BCBSM does not disclose reimbursement or other information on a provider-specific basis.

Q: How many other groups across the state are doing home visiting?

A: We are aware of several home care agencies who are providing services to mother/baby subsequent to a one-day admission.

Q: Is there any information that home visiting is not cost-effective?

A: Home care is cost-effective when it is in lieu of hospitalization.

Q: What are the hospital readmission rates for newborns discharged at 24 hours?

A: Data not available.

Q: What funds has BCBSM paid out for babies discharged too early?

A: Data not available.

Q: What costs does BCBSM absorb for an infant with PKU or other hereditary metabolic disorders that are not found early?

A: Data not available. The implication of your question is that care costs would increase because of BCBSM instituting a LOS target of one day for uncomplicated vaginal deliveries. **The reduction in length of stay guidelines that BCBSM and the majority of other insurers and HMOs have implemented should have no bearing upon early detection through PKU testing, as the test should be performed in the hospital's outpatient department or in the pediatrician's office if it is not done prior to discharge from the hospital.**

Q: Or are most of these costs to the state for institutionalization?

A: Data not available.

Q: What remedies does BCBSM have for the fact that 26% of the babies administered a hereditary metabolic screen (PKU) are receiving a report of insufficient milk feedings?

A: PKU tests can be and are administered on an outpatient basis, once the infant has received sufficient feedings. It is not medically necessary to keep a baby hospitalized solely so that there is adequate milk intake for a PKU to be performed. In addition, the state of Maryland requires that a follow-up PKU be performed when the infant is six weeks of age, and these customarily are done outside the hospital setting.

Q: Does BCBSM regard the hereditary metabolic screening as a cost-effective, medically necessary part of pediatric care?

A: BCBSM recognizes the value of the PKU screening test in the early detection and management of phenylketonuria. ■

InforMed proposal

BCBSM proposed to the state insurance commission the establishment of a network of physicians who will pay to have their practices compared with the practices of other physicians. InforMed, a private Baltimore company, would conduct these comparisons of charges and procedures and would collect data to help to keep health care costs in check.

As an incentive for physicians to participate, BCBSM would reimburse those who sign up with InforMed at a rate 5% higher than the reimbursement it pays other physicians. In order to finance the higher reimbursement, the insurer would increase fees at a cost of $2.5 million to subscribers. It predicts, however, a 10 million dollar savings as a result of the InforMed program.[5]

Insurance Commissioner John A. Donaho

In the closing days of the state legislative session, the Maryland Senate proposed amendments to a bill already passed by the House. The amendments, according to state Insurance Commissioner John A. Donaho, would have substantially weakened the bill that provided him with greater ability to oversee BCBSM. Mr. Donaho stated in a letter to newly appointed BCBSM president, William L. Jews, that if the Senate amended the bill, he would have no choice but to require BCBSM to maintain a surplus of $238 million (two months' worth of claims and operating expenses from the prior year). That requirement would drive the insurer into insolvency.[6]

On April 6, the Maryland Senate overruled the recommendation of its own Finance Committee by unanimously voting to require nonprofit insurers to reserve funds against unexpected claims or losses. Mr. Donaho stated that this action satisfied his greatest concern that BCBSM maintain an adequate surplus to avoid insolvency.[7]

On April 9, Governor Schaefer fired Insurance Commissioner Donaho. Sources in the governor's office indicated that the commissioner's efforts to gain more power to control BCBSM and his threat to drive the insurer into insolvency if legislators did not give him that power were factors in the governor's decision to remove Mr. Donaho from office.[8]

Samuel Claggett Chew: Clinician and educator

Samuel Claggett Chew's portrait is displayed in Osler Hall, a bright beacon of our medical heritage. A unique and distinguished physician who is virtually unknown today, Dr. Chew ranks at the top of Maryland's medical scholars and respected practitioners. The canvas painted by Marie Deford Keller (**Figure 1**) was presented to the Faculty on November 20, 1914, just several weeks prior to Dr. Chew's death at age 71.

Dr. Chew's own words, spoken in 1896 in tribute of Dr. George W. Miltenberger, vividly typify Dr. Chew himself:

> No one among us so well as yourself illustrates and represents in his single person the various departments of medical teaching and practice. You are here Sir, an honored teacher among your pupils, a father among your children. At various periods in your long and versatile career you have taught your pupils anatomy, pathology, clinical surgery, clinical medicine, therapeutics and obstetrics. Out of the fullness of your own acquirements you have imported knowledge and out of the earnestness of your own zeal you have inspired enthusiasm.

Dr. Chew's portrait was presented by noted Baltimore physicians, Charles W. Mitchell and William S. Thayer. Epitomizing him as a physician, Dr. Mitchell commented that "the quietness, refinement and depth of his sympathy for the poor, and suffering, the gentleness of his voice, the clearness and precision of his conclusions as to diagnosis and prognosis and treatment" made an unforgettable impression on those who knew and studied with him.

Dr. William S. Thayer, a distinguished Johns Hopkins physician, described Dr. Chew as "modest, thorough and unassuming with exceptional good judgment founded upon his natural abilities and training.... An able diagnostician and a remarkable good physician and a teacher who exerted a wide influence upon his fellow man." Thayer also noted that Dr. Chew was a "truly superior man," one whose intellect not only made him a wise doctor, but allowed him to use his wisdom and his humanity to the greatest effect.

Throughout Dr. Chew's distinguished career, he made a number of pioneering contributions that significantly advanced medical practice principles. These virtually unheralded contributions place him among Baltimore's most skilled physicians along with Osler, Thayer, Longeope, Pincoff, Baetjer, Krause, Carey, and others.

Educated at Princeton, Chew took a medical apprenticeship with his father and graduated from the University of Maryland School of Medicine in 1858. He gained experience in several European centers, from medical practice in Baltimore, as chairperson of materia medica at Maryland (1864-1886), and as chairperson of medicine at Maryland (1886-1909). During his professional career, Chew performed no laboratory studies, but prepared numerous papers and reviews of important current therapeutic principles. He expressed in writing personal opinions gleaned from his vast experience with patients

and his perceptive analysis of the available literature.

The following "first" clinical vignettes display this unusual man's depth and innovative capability.

- In 1862, in a translation of an article by the distinguished French physician Lemaire, Chew agreed that tuberculosis was contagious from person to person. Neither Laennec, Louis, or Virchow held this opinion.[1]
- In 1867, Chew described a "bellows" type cardiac murmur heard just under the right shoulder in a 31-year-old sailor with tuberculosis. The murmur was described as systolic (synchronous with the first heart sound). It was present over the posterior surface of the right side of the thorax and best heard by Chew at the inferior angle of the right scapula. At autopsy, in addition to the tuberculous lesions in the right upper lobe, there were two hard masses about the size of hickory nuts, consisting of "calcarious" residuals of tubercles that pressed directly upon a branch of the right pulmonary artery. This, he astutely surmised, had caused an obstruction (impediment) to the free passage of blood, which accounted for the blowing murmur heard with the systole of the ventricles.[2] This is an example of excellent application of clinical skills and may rank Chew among the first to explain adventitious vascular sounds based on obstruction to blood flow.
- In a remarkable paper in 1867, Chew stressed the importance of auscultation, particularly of the heart. Although he did not use the term "inching," he clearly described the necessity to move the ear or the stethoscope from "below to upward and find the sound increasing in loudness and and harshness and finally attaining its greatest intensity at a certain point at the base of the organ."[3] Chew had described a typical case of aortic stenosis. Even today, "inching" is a very acceptable bedside maneuver.
- Chew regarded venesection (bloodletting) as grossly overused. In 1869, he published a paper outlining several of his defined indications for venesection including (1) relief of the abnormal manifestation of pulmonary congestion in heart failure; and (2) hypertension or hypervolemia (a term not then in use) for cerebral hemorrhage.[4]
- A particularly informative paper published in 1875 described digitalis as a cardiac tonic. "Dilatation of the left ventricle" was its most helpful indication, but "in cases of pure uncomplicated hypertrophy," digitalis was invariably injurious. Chew stressed the importance of auscultatory findings as a guide to therapy and pointed out that in mitral regurgitation, there was a favorable reaction to digitalis with a good prognosis.[5] We should keep in mind that these views were made before the advent of the sphygmomanometer, chest x-rays, the electrocardiogram (EKG), computerized axial tomography (CAT), magnetic resonance imaging (MRI), Doppler imaging, and clinical pharmacology.
- In Chew's day, thoracentesis was regarded as a questionable technique, generally to be avoided. In a series of papers published between 1873 and 1876, he

Med Chi Bicentennial Celebrations

Med Chi has already begun planning celebration activities for its bicentennial in 1999. If you have ideas or suggestions, please call Margaret Burri or Vivian Smith at 410-539-0872 or 1-800-492-1056.

described when the "surgical procedure" should be performed and the technique of aspiration. His three indications were (1) bilateral effusion; (2) unilateral effusion, which formed rapidly associated with other manifestations; and (3) when grossly purulent fluid (empyema) was suspected.[6] Chew thought that aspiration was not an extreme procedure and should be employed before it was too late. Like other physicians, he stressed the importance of a flat percussion note, as an important bedside aid, and considered it possible to distinguish between serous and exudative fluids such as empyema by degrees of flatness of the percussion impulse. As a corollary, Chew described how adhesions could be induced artificially between the parietal and visceral pleura to inhibit excessive fluid formation such as in empyema or broncho-pleural fistula. Ablative adhesions were caused by injection of a mixture of tincture of iodine and carbolic acid.[7]

Dr. Chew's contributions were not limited to medical teaching and writing. From 1874 to 1875 and again from 1877 to 1878, Dr. Chew was vice president of the Medical and Chirurgical Faculty of Maryland, and in 1879-1880 and 1898-1899 (centennial year), its president.

The life and mark of physicians like Samuel Claggett Chew is to the practice of medicine what the blossom of the tree is to its fruit; it gives it the most delightful aroma and taste. It helps us appreciate how such gifted persons with ability and curiosity overcame so many obstacles. We improve ourselves by simply contemplating the scope and quality of all that they accomplished.

YOCON®
YOHIMBINE HCl

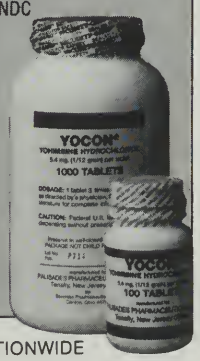
Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.



Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]

Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Imaging Case of the Month

A 52-year-old white woman was referred for evaluation of a 1.5 cm palpable nodule in the 11 o'clock position of the left breast. The mass was mobile and was not associated with tenderness. Attempted aspiration by the patient's physician did not yield fluid. The patient had no significant family history of breast carcinoma and no history of prior breast surgery.

Craniocaudal and oblique mammographic views of the left breast were performed **(Figures 1 and 2)**, as well as a spot compression magnification view of the mass (not shown).

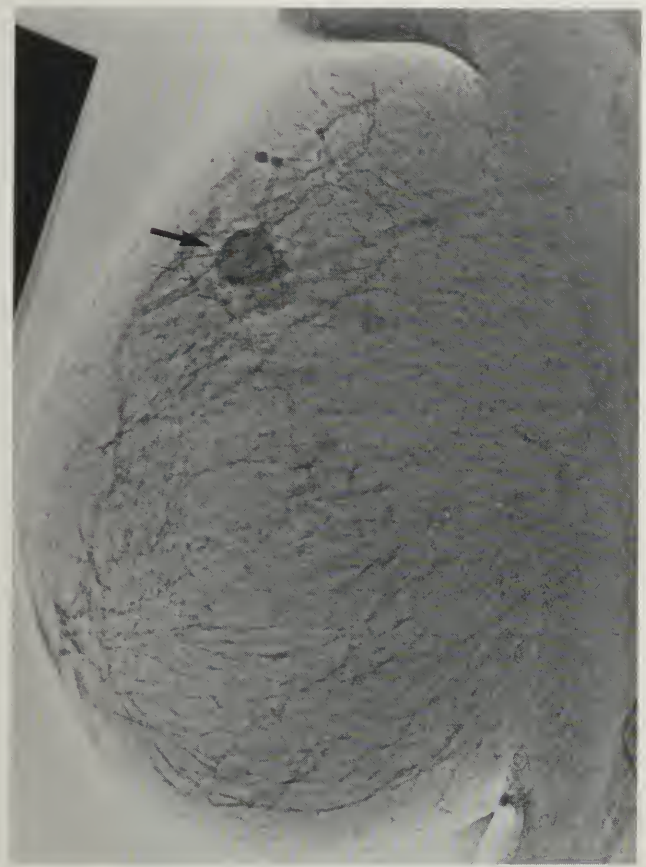

Figure 1.

Figure 2.

Breast carcinoma with halo sign

Figure 1. Oblique mammographic view of the left breast demonstrates a 1.5 cm smoothly marginated oval mass in the upper aspect of the breast. This is surrounded along its anterior aspect by a curvilinear radiolucent zone (arrow). The posterior margin of the mass is partially obscured by the surrounding breast tissue.

Figure 2. Craniocaudal mammographic view of the left breast (cropped) shows the mass in the slightly medial aspect of the breast. In this image, the mass is almost completely surrounded by a radiolucent zone, also described as the halo sign (straight arrow).

This patient presented with a 1.5 cm solid palpable mass in the 11 o'clock position of the left breast. The presence of a partial or nearly complete halo or radiolucent band surrounding a mass, as seen in this case, has long been considered a mammographic sign of benignity.[1,2] Pathologic evaluation of this mass, however, revealed an infiltrating ductal carcinoma.

The halo sign has alternatively been described as a categorical sign of a benign process or a strong secondary sign of benignity. Unfortunately, major exceptions to this rule exist. In a study performed in the Breast Imaging Section of the Department of Radiology of the Massachusetts General Hospital from January 1978 to July 1986, 18 women with malignant breast masses demonstrating a partial or complete halo sign were identified. Of these malignant lesions, 10 represented infiltrating ductal carcinoma; 4 represented lymphoma of the breast; and there was 1 each of breast cancer metastatic to an intramammary lymph node, cystosarcoma phylloides, malignant fibrous histiocytoma, and metastatic melanoma.[3]

It has previously been postulated that the halo sign represents compressed fat surrounding a lesion. Densitometry, however, does not demonstrate a density change across this zone. It is more likely that the lucent zone represents an optical illusion caused by a macroscopic smooth border that changes abruptly in density peripherally. This phenomenon is called the Mach effect.[4]

Regardless of etiology of the halo sign, it is clear that while it is frequently identified in benign lesions such as cysts and fibroadenomas, it cannot be considered pathognomonic for these entities. Nor can it be considered a sign of a noninfiltrating malignant process, as over half of the malignant masses exhibiting a halo sign in the Massachusetts General Hospital study were infiltrating ductal carcinomas. Caution must be used in the evaluation of all solid breast masses, and malignant etiologies must be considered even in the presence of the halo sign.

Book Reviews

William Henry Welch. Simon Flexner and James Thomas Flexner. Baltimore: Johns Hopkins University Press. 1993. 572 pages. $29.95

Don't be put off by the formal-sounding title and joint scholarly authorship. This book is a good read.

Originally published by the Viking Press in 1941, it is now re-issued by the Johns Hopkins University Press with a foreword by Thomas Turner.

It is basically the background of modern medicine in the United States. It explains the curriculum that physicians encountered in medical school. Most importantly, this 50-year-old gem does it with style.

The content is just as advertised—the story of a heroic figure and of an era. Dr. Welch lived in an age of heroes. He captured the public admiration just as a Jack Dempsey or a Babe Ruth, and his fame lasted for more than 15 minutes. His impact on medical thought and educational method has lasted for a long time. The age of his life span, 1850-1934, was one of tremendous growth and change for everyone.

The Four Doctors (Welch, Halsted, Osler, and Kelly) by John Singer Sargeant.

William Welch grew up in Litchfield County, Connecticut, in a family where his father and many male relatives had practiced medicine. But it was not a story of royal succession. William's mother died when he was six and his father remarried when William was in his mid-teens, but was always wedded to his practice. How do early loss, frequent solitude, and loneliness figure in a life of great accomplishment? Read the book.

While you learn about young Billy, you can view the state-of-the-art by a glimpse of his father's (William Wickham Welch) practice:

> However, like most country practitioners of the time, Dr. Welch mingled traditional medicine with the scientific. He kept a ledger in which he recorded under the name of the disease, remedies which other local physicians believed efficacious; he would note in the margin that it was the favorite prescription of Dr. So-and-so. Sometimes his "cures" seem bizarre to modern eyes. He was, for instance, particularly proud of his remedy for snake-bite: copper filings cut from a penny, dissolved in vinegar, and immediately applied to the wound. Of course the chemical thus produced, copper acetate, had no effect whatsoever, but the rattlesnakes of Connecticut are fortunately so small that they rarely give a fatal bite; William Wickham was able to boast that he had "never lost a case."
>
> As was again typical of his period, Dr. Welch believed in drugging; George T. Johnson, the local pharmacist, says of his prescriptions: "I remember some that he wrote which had in them everything that he knew the name of." Elder citizens of Norfolk would call for a bowl and mix medicine in it, seeking to get the right proportions by tasting the concoction as he went along.
>
> William Wickham, however, believed in the virtues of fresh air, which many of his colleagues regarded as a deadly poison for fever sufferers. The story is told that on passing the house of a patient late one night, he saw that the windows were, contrary to his instructions, all shut. He reined in his horse and tore the window of the sick-room from the house, frame and all. Placing it in his buggy beside him, he drove on, confident that his patient would no longer disobey his order.

After classical studies at Yale, William developed a late calling for science and medicine. From Columbia he went to Germany, then returned to New York City before being recruited by Hopkins in 1885.

> At 35, Welch had found himself a place in the world that was perfect to his needs and desires. For many years a genie confined in a bottle, he rose up, once the cork was pulled, into his true dimensions, and for almost 50 years he was to tower over American medicine, determining, creating, helping change a backward profession into a leading profession of his time. Moving in a highly

> controversial field toward revolutionary ends, he was always gentle, never raising his voice above the tone of ordinary talk. He won campaign after campaign but never fought a battle; haste was unknown to him, or anger or the exuberant joy of putting an opponent down. He was to win affection and admiration until he became, first to his associates and then to younger scientists everywhere, in common parlance the beloved "Popsy."

There was a perfect "fit." A lifelong bachelor, he had vision, drive, and perseverance. The Hopkins plan became the model for United States and worldwide medical training. He went back to New York, traveled all over, and was a consultant in China. He often walked the neighborhood, usually smoked cigars, and was fond of word games. As he was a public figure in later years, he hobnobbed with the rich and famous. By the time he retired in 1931, there were still no effective antibiotics, but the practice of his father's era had disappeared, and medical education was organized around scientific observations as it still is today.

The book contains an appendix and an index, but the text is refreshingly nonstuffy. Welch knew how to organize, teach, and persuade. The Flexners knew how to chronicle.

The dust jacket has a glossy print of John Singer Sargent's *The Four Doctors* (Welch, Halsted, Osler, and Kelly) on the front, but just to reassure you, there's a bar code on the back. No doubt that today's biographer might include more conflict, perhaps a small scandal. However, this is a well-written biography. Anyone who has been to medical school will find it fascinating.

Medical Malpractice: Handling Emergency Medicine Cases. Gervase M. Flick. Colorado Springs, Colorado: Shepard's/McGraw-Hill. 1991. $95.00

The most impressive thing about *Medical Malpractice: Handling Emergency Medicine Cases* is the number of times the name of the author/editor appears with some or all of its qualifiers. "Gervase M. Flick, M.A., M.D., J.D., M.P.H., F.C.L.M., D.B.L.M., charter member, American College of Emergency Physicians" appears no less than 123 times in 736 pages of text. After reading each of them, one marvels at the simple "G.M. Flick" acknowledgment that appears on the cover of the volume.

The next surprise to me was that, despite the subtitle, "Handling Emergency Medicine Cases," the first chapter to specifically relate to that topic was chapter 31 (out of a total of 40). The first 30 chapters, although interesting reading, constitute an historical overview of the specialty of emergency medicine as seen through the eyes of an urgent care center practitioner who considered himself to be practicing emergency medicine when an intern at Burbank Community Hospital in 1960. That he has not been certified in emergency medicine (EM) is obvious through the glaring omission from his string of credentials of any (such as D.A.B.E.M. or F.A.C.E.P.) that would qualify him as a specialist in the field.

The third was the incredibly poor literary style of the principal author, noticeable as early as the preface through sentences such as "Legal pioneers have also played an important role in the conceptual development and the ensuing changes of what entails emergency medicine and how it should be practiced for the benefit of all." Flick's style was so egregious that I could immediately tell which parts of each chapter were written by him, and which written by others and only "edited" by Flick. His poetic license expired in Section 1.01 with these lines: "They [emergency physicians (EPs)] were a new group of physicians who had felt the adrenalin high of confidently facing the wide variety of complex, acute problems that they repeatedly treated in the emergency rooms of this nation. Their theme song became the melody in the Doppler effect of the passing ambulance siren."

The inclusion of amazingly simplistic statements of Flick's own, such as "attorneys, by way of instituting lawsuits for medical negligence, have come to fill this vacuum which physicians have created.... I can stipulate that one of the greatest single causes of medical malpractice suits in the United States is medical malpractice," and "a thorough record is a well-documented record," or by misfortune plucked from the presentations of others. "According to Bernard Hirsch, M.D.... at least 10% of all physicians do not keep thorough records and at least 20% of all physicians could stand some improvement in their recordkeeping efforts," to which Flick adds gratuitously, "After reviewing hundreds of records by other physicians, it is this author's impression as a physician-attorney that these estimates of the number of poor record-keepers are probably on the conservative side."

This first made me question the intellectual level of audience the author was targeting. Not physicians, I decided at this point, and certainly not emergency physicians. ("As a group, physicians probably have some of the biggest egos in the world, and emergency physicians probably have the biggest within the medical profession.") Yet the level of legal advice he gave was so elementary as to be insulting to attorneys (and to most physicians, for that matter). For example, "To [read emergency electrocardiograms and x-rays done on inpatients at night] is to ask for medical/legal problems." So who was he writing for, I kept asking myself, the press? His family? (His father, G.C. Flick, D.O., former Jesuit priest and ethical prophet of the profession?)

Clearly, Flick was on a soapbox about several issues. His extensive coverage of rules relating to board certification in EM and fellowship in the American College of Emergency Physicians (ACEP) left the unmistakable impression that he has a bone to pick with one or both accrediting bodies. "Board members [' conservative attitudes] cause them to change the requirements for board certification [such that the] board members themselves would no longer be eligible...if they had to apply.... Perhaps psychologists should study this phenomenon whereby specialty medical board examiners make the eligibility requirements continually tougher for new candidates." "For reasons of its own, [the American Board of Emergency Medicine] ABEM does not like to have candidates using the board eligible designation, even when the physicians are fully board eligible.... The resignation rate [from ACEP] has been due to a variety of reasons [such as that] some physicians no longer find the ACEP's high dues, large staff, and multimillion dollar budget relevant to the practice of emergency medicine at their particular hospital or freestanding urgent care center." Although feelings about such matters are important, I questioned the purpose of including them here (unless, of course, they were the reason the book was written).

As a member of the ACEP Wellbeing Committee, I was glad to find a chapter on stress and attrition within the specialty (although I had to wonder what it was doing in a volume of a series seemingly aimed at attorneys). Flick mentioned several aspects of this problem that I have not seen previously published (but which could universally be acknowledged), such as "Some staff members...will keep trying to put their responsibilities back on the shoulders of the emergency department physician. They may take unbelievable liability risks for themselves and others to save themselves from an unscheduled night trip back to the hospital. EPs who allow staff physicians to do this may end up as codefendants in court." But his conclusion, that "Emergency medicine is not a specialty for the faint of heart, the weak of mind, or the frail of body," did not add anything to the understanding of the problem, and probably could have stood alone in place of the chapter.

Some of Flick's risk management advice is impractical or ridiculous, such as his assertion that an **incident sheet** concerning incorrect notations recorded in the ambulance records (which he acknowledges may not even be written when the ambulance arrives and critical emergency department care begins) **must** be filled out and signed by the physician and the nurse before their shifts are completed; or the implication that failure to seek previous records from all possible sources (although not standard of care at this time, may be) negligent under critical circumstances.

Several of the pronouncements he makes are overstatements. ("When physicians let days go by before finishing particular emergency facility records, this frequently constitutes medical malpractice.") Some of the advice he has lifted from other sources and stated as if axiomatic, are matters of opinion ("If any vital signs are abnormal, of course, this must be pointed out to the patient") or obvious ("Discharging patients with substantially abnormal vital signs can cause problems when you need to defend the quality of care"). And some of his "pearls," such as always to suspect fast pulse rates which are prime numbers, seem totally out of place in such a volume. His entire chapter on incident reports is so full of imperatives and advice that it is difficult if not impossible to follow (such as filling out an incident report before the work shift begins...), and the chapter is probably best skipped.

Flick makes some interesting observations that are presented as if revelational: "It is the opinion of this author that wrongful deaths because of medical negligence are accidents," and he chastises plaintiffs' attorneys for failing to file for double-indemnity remuneration from insurance policies. "The most obvious litigation-prone professional group is attorneys, their immediate families and close relatives" but also, he admits, those who are accident-prone, drug abusers, alcoholics who continue to drink, those dissatisfied with their jobs, marriages, or their lives in general, and of course physicians' families (though not physicians themselves). Surely such stereotyping alienates plaintiffs' attorneys (who are thus portrayed as pandering to misfits) almost as much as his assertion that "when lawyer ignorance combines with lawyer arrogance and attorneys fail to investigate fully possible medical negligence which is brought to their attention by injured clients..." results in exhaustion and frustration on the part of poor patients who become plaintiffs.

Flick alienates and confuses physician readers when he quotes and juxtaposes random bits of conflicting clinical advice. "A lumbar puncture is mandatory to establish a definitive diagnosis of meningitis," however, "a lumbar puncture should be carefully considered on a case-by-case basis before routinely ordered in cases of suspected meningitis," with his own medicolegal advice, to wit: "If a lumbar puncture is not done in any case of possible meningitis, the emergency record should reflect the history and the physical findings that would support such a decision. The patient's medical record should be written in a manner that would be convincing to a jury should there be litigation over the issue years later." He alienates attorney readers when he speculates that "Some attorneys have an ego problem prohibiting them from giving serious consideration to any trial advice offered by physicians." He even alienates patients (which we all are, eventually) with advice such as "This (approach to telephone consultation) may not be good

hospital politics, but it is good medicine, and it may save both physicians more than just a few days in court." He adds, as if an afterthought, "It may also save the patient's life."

To his credit, Flick does make one point that may be of use to emergency physicians who are struggling with hospital administrations over departmental status. Clinical privileges to perform procedures are normally granted to the practitioner by the clinical department, subject to approval by the medical staff. This being the case, it is hard to argue that, for example, chiefs of departments of surgery, themselves not credentialed to perform certain ED procedures such as pacemaker insertion or precipitous delivery, should be entitled to make such privilege decisions with respect to emergency physician applicants.

Several of the chapters contributed by others, notably those on transport and transfer and preparation of EM cases, by attorney William Reisbick, and on expert testimony, by emergency physician Samuel Coleridge, are well written and useful to physicians or attorneys involved in cases. But ulterior motives peek through—such as the assertion in an M.D./J.D.–written chapter that in some cases, "plaintiffs' attorneys should have physicians/attorneys in the courtroom, and that failure to do so...may result in a legal malpractice claim."

A number of internal inconsistencies between contributors, misspelled words, misnamed institutions (such as Johns Hopkins Memorial Hospital), and mistaken credentials kept me reading the book for all the wrong reasons. But overall, I believe the book suffers most from its lack of reader definition—too simplistic legally for attorneys, and too simplistic clinically for physicians—to be of much value to either group.

Immunology of Pregnancy and Cancer. Valentin I. Govallo. Commack, New York: Nova Science Publishers, Inc. 1993. 310 pages. $79.00

The treatment of cancer using a placental extract is this book's raison d'etre. Much material only slightly relevant to the fundamental theme is presented, however, and the sheer volume of words might prevent some readers from pursuing reading until the stimulating portion about a novel, cancer-treatment therapy is reached.

To justify his claims, Govallo thoroughly reviews the human immune system, which is responsible for homeostasis maintenance. This complex entity, controlling the organism's qualitative stability protects from foreign and emerging modified cells; eliminates deficient and injured cells; and neutralizes and eliminates unfamiliar high-molecular-weight compounds of biological origin.

Govallo reaches toward a cancer control theory envisioning normal pregnancy as a prime example of immunologic control. He believes the key issue in pregnancy maintenance is the blocking and resulting loss of action of the maternal immune system toward the foreign proteins of the fetus. The placenta provides the inhibitory products, creating a shield, and their lack may lead to spontaneous abortion. In addition, some antibodies may enter the bloodstream to inhibit T lymphocyte effect or functions and interleukin-2 production. Cell-mediated immune response is demonstrated by para-uterine lymph node enlargement in early pregnancy and lymphokine production. The fertilized ovum also produces an immunosuppressory factor that inhibits T cell activity. Nonfertilizing spermatozoa and semen plasma components provide further factors to block lymphocytic response to blastocyte antigens. The uterine endothelium is infiltrated by suppressor cells whose soluble products inhibit interleukin synthesis that activates normal killer cells and cytotoxic T-effectors.

Besides its trophic functions, the placenta's decidual membrane has an important immunoregulatory function. The placenta is simultaneously a passive anatomic filter between mother and fetus and an active barrier that uses antigenic structures and liberated remote immunoregulators to control immunological reactions. If immunosuppressive substances, such as hormones, antigens, and lymphokines, are not provided by the placenta, the embryo may be attacked by the maternal immune system and recurrent spontaneous abortion witnessed.

Vaccination by two methods was tried to save these pregnancies: skin grafting and lymphocyte injection. The initial patient had had 15 successive miscarriages. Small skin grafts were exchanged between husband and wife. The husband lost his graft in 10-12 days, but the wife's survived for more than eight weeks. A child was subsequently delivered by cesarean section. In 12 additional cases treated in the same manner, eight mothers delivered normal babies with good weights, although four miscarriages occurred in the 20-22 week. The failures suggested that repeated alloimmunization might be necessary. Results materially improved when paternal lymphocytes replaced skin as an antigen. In 606 mothers treated with lymphocytes for this disorder, 91.3% delivered live babies.

With the analogy between fetus and malignancy in mind, Govallo thought he might influence the shield cast about a cancer by itself, which protects it from host immune attack. If the barrier could be made penetrable to the action of the host immune system, tumor growth might be influenced.

These thoughts stimulated use of a complex form of immunotherapy revolving around the injection of lymphocytes obtained in various ways, immunization with embryonic tissues, and injection of

bacillus Calmette-Guerin vaccine. Tumor growth, inhibition or regression, however, was not substantially achieved by these methods. This stimulating type of immunotherapy was used in 66 patients with assorted malignancies: eight survived up to 3 years; four up to 5 years; and two for 10 years or more. The five-year survival rate, an accepted criterion for judging results, was 6% (4 of 66).

This embryonic tissue experimentation convinced Govallo that it was possible to influence resistance to tumor growth. Deblocking therapy aimed at removal of this endogenous protection was then conceived. Chorionic villi extract was injected into the patient. It was hoped this would evoke an antibody response and alter the shield to permit attack by the host immune system (**Figure 1**). In 35 patients receiving immunoembryo-therapy, 31 survived up to 3 years; 27 up to 5 years; and 17 for 10 or more years. The five-year survival rate was 77%, a considerable improvement over immunotherapy.

Govallo lays great store in using a lymphocytogram to detect immune changes prior to evidence of clinical symptoms. In the normal patient, about 90% of the lymphocytes do not exceed 8 μm in diameter, with the rest being larger. Three basic divisions may be made: small (up to 7.5 μm); medium (8-13 μm); and large (14-20 μm). Corresponding normal percentages are 21-28; 61-72; and 5-10. Tumor patients in terminal disease stages have a decreased number of small, and an increased count of large, lymphocytes. After therapy, these cellular parameters return to normal.

The lymphocytogram does not depend on the cancer's histological type or location. Changes were not observed in benign tumors, or in inflammatory, degenerative, or metabolic disease. Interestingly, a prolonged delayed return to normal was witnessed when malignant tumors were successfully removed.

Many aspects of this novel treatment require validation to substantiate the author's claim. Just as loss of small lymphocytes from the blood stream may be used as a diagnostic tool, the return of these cells in normal numbers after therapy would indicate that the desired result was being obtained.

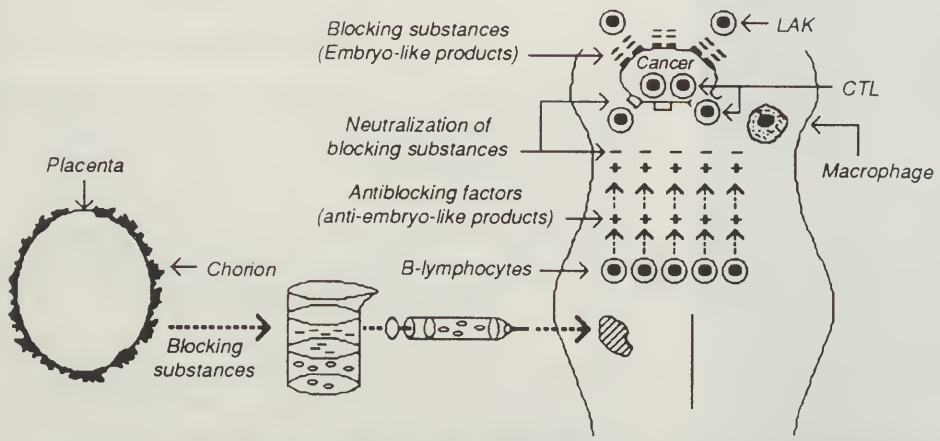

Figure 1. Hypothetical scheme demonstrating antiblocking activity of placental extract in patients with cancer. CTL = cytotoxic T lymphocytes. LAK = lymphokine activated cells.
(Figure 1 is reproduced through the courtesy of Nova Science Publishers, Inc.)

This book does not permit rapid reading because frequent pauses for digestion of the material must be made. The small number of cancer patients and the lack of detail regarding them are debits. A statistician would also point to an absence of controls, although the patients treated before the use of chorionic villi extract was started may serve as such. The theory regarding a tumor as an embryo is unique. The immunologic basis for pregnancy maintenance seems sound, and transfer of this knowledge to cancer therapy seems plausible. Further experience is mandatory to prove beneficial results from chorionic therapy. If the results are accurate, this innovative approach could be one of the greater discoveries of the twentieth century. The book should be read with hopeful anticipation and not accepted as dogma.

The author, the director of the Laboratory of Immunology in Moscow, has been interested in the field for over 30 years and has been treating advanced cancer patients with placental extract for about 16 years. He is well recognized in Russia through the publication of scientific articles. This translation of his life work is the initial major presentation of immunology in cancer and its related therapy in this country.

1953:
Stalin died.
DHEW was born.
Oveta Culp Hobby spoke to the AMA convention in New York City. She warned organized medicine to find solutions for the socioeconomic problems facing the medical profession or the solution would be taken away from doctors.

Below is a clinical pathological conference discussing a case that might be managed more successfully today. As you read, consider what the least expensive, most efficient care might be if this were your patient in 1993.

*Clinical Pathological Conference**

Reprinted from the *Maryland State Medical Journal* 1953; 2(4): 189--200.

Clinical history #593,713. F.A.J. Married. White. Male. Age 43. Admitted: December 24, 1951. Died: Dec. 27, 1951.

Complaint. Shortness of breath over a period of two weeks.

Family history. Unimportant.

Past history. Typhoid fever at the age of 23 years; scarlet fever one year before admission, otherwise he had enjoyed good health. As a civil service worker he had had frequent physical examinations including chest x-rays. So far as he knows, never had any elevation of the blood pressure. Always rather heavy, about 220 pounds, but during the year before the present illness had reduced his food intake and had brought his weight down to about 185 pounds.

Present illness. In retrospect, the patient thought that probably for 5 or 10 years prior to the present illness, he had noticed increasing dyspnea after vigorous exercise. About four months prior to his admission he had become quite dyspneic on the slightest exertion and this lasted one or two hours. It passed off uneventfully and did not recur. Two weeks before admission, he developed a cold and some cough productive of small amounts of clear sputum, and with the

* *Presented at the Annual Meeting of the Medical and Chirurgical Faculty on April 30, 1952, by the Johns Hopkins University, School of Medicine (Transactions 1952).*

cough he developed increasing dyspnea, so that he would become short of breath with as little exertion as walking the distance of one block on the level. He never had expectorated blood and had no pain in his chest. He could sleep lying down and was never dyspneic at rest. Three days before admission, he awakened to find that rather suddenly he was much more short of breath as compared with the proceeding day; in fact he was too short of breath to answer questions or talk, and he found it difficult to dress himself. For the first time, he became conscious of palpitation associated with his dyspnea, but denied the presence of any chest pain or substernal pain or oppression. He saw his physician who found his temperature to be 97°, noted the dyspnea, and found his blood pressure to be 130/110. Patient was admitted to a local hospital. There was no cyanosis, but the neck veins were distended. An x-ray of the chest was made that showed "infiltration extending out and up from the left hilum." He was given penicillin. The next day he was somewhat cyanotic, and the pulse was accelerated, the rate being 120. He was given nasal oxygen and put on digitalis, but without any improvement. He was brought to Baltimore and admitted on the surgical service of the Johns Hopkins Hospital, with the provisional diagnosis of a mediastinal mass. Six hours later, he was transferred to the medical service. He had had no pain, no edema, no chills or fever, and the only difficulty of which he complained was the dyspnea.

Physical examination. Temperature 101°. Pulse 100. Respiration 20. Blood pressure 101/80 equal in the two arms.

The patient is described as a heavy set and large-chested man, lying flat in bed, breathing rapidly. Sitting up produced no decrease in his respiratory rate; he would have to stop in the middle of a sentence to catch his breath. The face was ruddy. There was no glandular enlargement except for some small cervical nodes. The pupils reacted actively to light and during accommodation. The extraocular movements were normal. The fundi were described as normal. There was a slight nasal discharge but no obstruction. The pharynx was considered normal. The neck was supple. The trachea in the midline; no venous distension in the neck was noted. The chest was large with some increase in the anteroposterior diameter, but the lungs were clear to percussion and auscultation. The diaphragms moved well, and there were no adventitious sounds heard. The left border of the heart extended to the midclavicular line. There were no shocks or thrills. The heart sounds are described as distant and of only fair quality. The second aortic sound was louder than the second pulmonic and along the left sternal border, in the fourth interspace, there was a split second sound, the second component of which suggested an early diastolic murmur to the examiner, but only in certain phases of respiration. This was not definite and no other murmurs were heard. The liver edge percussed to the costal margin. There was no abdominal tenderness or mass. The spleen was not felt. The genitalia showed nothing abnormal. A rectal examination was not made. There was no clubbing of the fingers. There was no cyanosis, and no edema of the extremities. There were good pulsations in the vessels of the feet, and the reflexes were normal. There was no motor or sensory disturbance.

Course in hospital. The patient was put at complete bed rest and given oxygen by catheter. The following day, he seemed somewhat less short of breath, but he still would become dyspneic on talking. The venous pressure was 130 mm of water and the circulation time, arm to tongue with decholin (dehydrocholic acid), 30 seconds. The blood pressure was lower, having fallen to 90/60. The following day, the patient, rather suddenly, became much more short of breath and his blood pressure was 88/70. At that time, the venous pressure was 150 mm of water, and the circulation time had increased to 75 seconds. The lungs remained clear on physical examination but the gallop rhythm had become more pronounced. His cough tended to increase, and he complained of some substernal irritation which was thought to be aggravated by coughing, and he also complained of lower abdominal pain, but nothing further could be found on physical examination. Later that day, he vomited. This greatly increased his shortness of breath and caused a recurrence of his abdominal pain. The splitting of the second pulmonic sound seemed more pronounced. The pulse rate was 120; respiration was labored at a rate of 28. The lungs still remained clear. The abdomen was soft, there was no spasm or rigidity, but still some tenderness in the left lower quadrant but no rebound tenderness. Oxygen, which had been administered by catheter, then was changed to a tent. This made him much more comfortable. The possibility of a pneumonia was considered, and antibiotic therapy was instituted with Aureomycin (crystalline chlortetracycline hydrochloride). He also was given digitalis. His condition grew progressively worse, the shortness of breath increased and he was increasingly cyanotic. The heart was still not enlarged, but the sounds now were considered of mushy quality and further comment is made of the existence of the protodiastolic gallop. The liver was thought to be somewhat enlarged, and the veins of the neck became distended. Still the lungs remained entirely clear on physical examination. There was no edema of the lower extremities but the note is made that the right calf was 1.5 cm larger in circumference than the left, but there was no tenderness. His condition grew steadily worse; his blood pressure was unobtainable, and he became

very excited. This increased his dyspnea and terminated only when he collapsed, and death followed in about five minutes.

On admission, the temperature was 99° by rectum; in four hours it had reached 101°, and it varied between 100° and 101° for the next 48 hours when it reached a maximum of 102°, falling rapidly before death.

Laboratory data.

- *December 24, 1951.* Blood: Hemat, 49. SR, 10. WBC, 13,000. PMN, 64%. Lymph, 30%. Mono, 6%. Smear shows no abnormal cells and platelets are adequate.
- *December 24, 1951.* Urine: Sp Gr, 1.015. Acid: Sugar, 0. Alb, trace. Occasional white cells, no casts.
- *December 25, 1951.* STS, negative.
- *December 25, 1951.* Blood culture, negative.
- *December 26, 1951.* Blood chemistry: NPN, 45 mgm%. Sugar, 92 mgm%. T Prot, 6.9 gm%. Alb, 4.2 gm%. Glob, 2.7 gm%.
- *December 27, 1951.* NPN, 54 mgm%. Sugar, 132 mgm%. CO_2, 22.1 m/eq. Chlor, 101 m/eq. Potas, 5 m/eq.

Electrocardiograms.

- *December 24, 1951.* Rate, 94. P-R interval, 0.19 sec. Rhythm, S-A. P waves, normal. QRS complexes: Tiny, variable Q3. Maximum deflection in limb leads (5.5 mm in Lead 1). T waves: Inversion T3, V1 and 3. ST segments, normal. QT interval, 0.38. R-R, 0.66 (prolonged). Interpretation: QRS amplitude at lower limits of normal. Q-T interval prolonged. Digitalis "effect."
- *December 25, 1951.* Since the record of December 24, 1951, the Q3 has disappeared. QRS amplitude is still at the lower limits of normal. Q-T interval, 0.44. R-R, 0.76 (prolonged).
- *December 27, 1951.* Rate, 94. P-R interval, 0.16 sec. Rhythm, S-A. P waves, normal. QRS complexes: Low voltage in limb leads. Delayed precordial transition. Vertical axis T waves: Sagging ST 3 and V1 with inverted T waves. T2 low, upright. Q-T interval, 0.40. R-R, 0.68 (slightly prolonged). Interpretation: Low voltage in limb leads. Prolonged Q-T interval. Abnormal T waves.

X-ray, outside film

- *December 22, 1951.* A chest film taken this date at St. Mary's Hospital, Leonardtown, Maryland (two days before films at this hospital were taken) also reveals an infiltration extending from the hilum into the upper lobe on the left. The film is light, making it difficult to see much difference between the two sides on this particular film. The findings are essentially those as reported here on December 24 and 25, 1951.

X-rays.

- *December 24, 1951.* Chest: There is an irregular infiltration in the left lung field near the hilum apparently localized in the apical segment of the lower lobe. The lung fields otherwise are clear. The heart and great vessels are within normal limits. The etiology is suspected to be of virus pneumonia, although a neoplastic process cannot be excluded.
- *December 25, 1951.* Chest: There has been some resolution of the infiltrative process in the left lung as compared with the previous films of the day before, although this still does not exclude a tumor, it gives more support to the impression of pneumonia.

Summary

Dr. Wainwright. We'll have the x-ray, please. This film of the chest shows the shadow coming out from the hilum on the left side **(Figure 1)**.

Now then, in summary, we have a 43-year-old white man, who, for several years, was becoming increasingly short of breath, and four months prior to admission experienced a short, rather acute attack of dyspnea which passed off

Figure 1. This x-ray shows the shadow coming out from the hilum on the left side.

uneventfully. Two weeks before admission, he developed an upper respiratory infection which greatly aggravated his dyspnea but did not provoke cough, hemoptysis, or pain. He was singularly free from orthopnea. The day before admission, he was awakened by extreme dyspnea and was now aware of palpitation. His physician found him short of breath with distended neck veins but not cyanotic, with a high diastolic pressure and a small pulse pressure. The only cyanosis commented upon was on the next day, and it evidently was not profound; and at this time, the infiltration that you have seen in the x-ray was described.

Thus far he had no fever, but on admission to the hospital in Baltimore his temperature was found to be 101°, and his blood pressure had fallen to a much lower level. His dyspnea was extreme, but there was no orthopnea and no cyanosis. The veins of the neck were not distended. Although the chest was large, it was not emphysematous, and on physical examination was found to be entirely clear. The heart was not enlarged, the sounds distant and of poor quality, a gallop rhythm was heard, there were no murmurs, and the second pulmonic sound was not accentuated. The liver was not enlarged, and there was no edema.

The patient's course in the hospital was a stormy one, he lived but three days after admission, and had fever with a slight leukocytosis all the while. He continued to be dyspneic, but was not cyanotic. His venous pressure was only slightly elevated, but the circulation time was quite prolonged and materially increased while the blood pressure remained low. The lungs remained clear on physical examination, even though the respiratory rate and the pulse rate increased, and his respiration became more labored. The gallop rhythm persisted and became more pronounced, and the heart sounds became of increasingly poor quality and are described as "mushy." He developed lower left quadrant pain which persisted, but nothing beyond some localized tenderness was found. As he rapidly became worse, congestive failure developed and he died.

The laboratory data accumulated showed little that was of aid in the diagnosis. The x-ray of the chest showed a shadow in the left lung field, which you have seen. The electrocardiographic studies showed variations from normal and appeared to be more than the digitalis he had received could account for. There was a tendency to right axis deviation, although this was by no means distinctive. The changes were not specific, but would appear to indicate that his heart was laboring under great strain.

Discussion

Dr. Wainwright. In the discussion of this case we must consider the problem in three ways. (1) Was there anything within the mediastinum but without the heart or lungs which caused this difficulty? (2) Was the cause of his trouble primarily pulmonary? (3) Was the condition that produced his symptoms and caused his death cardiac?

With regard to the first question, the only condition that might be considered is a mediastinal tumor. The possibility of this is suggested in the appearance of the chest by x-ray, and to the roentgenologist, the shadow coming out of the left hilum was capable of this interpretation. To suggest it, however, is to dismiss it, for the history is much too long; and to have experienced such a degree of dyspnea from a mediastinal tumor, there surely would have been obstruction of the trachea with stridor and most surely other evidence of a space-occupying mass.

The decision as to whether his condition was pulmonary or cardiac is more complicated, and one must consider both chronic and acute lung conditions in seeking a pulmonary origin for his symptoms and signs. Of the chronic pulmonary conditions, emphysema with its accompanying chronic basal infection and interstitial fibrosis of the lung would merit consideration.

Although the patient had had increasing dyspnea for four or five years, it was not the story of emphysema and chronic bronchitis, and exacerbations with each recurring respiratory infection. His chest is described as being one with increased anteroposterior diameter, but it was not found emphysematous by x-ray. Cough and sputum were conspicuously absent, and whereas the lack of orthopnea would suggest that his dyspnea was pulmonary in origin, the results of increasing obstruction to the pulmonary circulation were not present. There was no accentuation of the second pulmonic sound, no chronic cor pulmonale, or a failing right heart. There was only dyspnea on exertion without cyanosis, with his capacity for activity steadily decreasing.

Interstitial fibrosis of the lung was described originally by Hamman and Rich as acute and was a diffuse thickening of the alveolar structure, producing obstruction to the pulmonary circulation. The course was often a matter of weeks or months, but was acute as such diffuse pulmonary disease goes. The pulmonary phase of the condition was dominated by dyspnea and cyanosis, but often the patient was not seen until heart failure had developed, and frequently the underlying pulmo-

nary difficulty was not appreciated, being so completely overshadowed by the heart failure. However, the heart failure was right sided with all of the cardiac manifestations of obstruction of the pulmonary circulation. In this instance, what would have to be considered as the pulmonary phase of the disease was long, four or five years. Cyanosis was not present and right-sided heart failure appeared only as a terminal event. In either pulmonary fibrosis or in emphysema, obstruction to the pulmonary circulation is the mechanism by which the condition leads to a fatal determination. It was lacking in this case, and diffuse pulmonary disease would have produced a picture quite different from the case in hand.

As to any acute pulmonary condition, one would consider a pneumonia or pulmonary embolism. The onset of his terminal illness was not that of an ordinary pneumonia, and the fact he had no fever for 48 hours after the onset would be most unusual in pneumonia. Furthermore, there were no signs of consolidation on physical examination, the intoxication of the disease was not present, and cough, sputum, and hemoptysis were likewise lacking. If the shadow shown by x-ray was an infiltration, it was central, which would account for the lack of physical signs, and would suggest an atypical or virus pneumonia. If such were the case here, one would surely have to consider some affection of the myocardium concurrently present, and that the pneumonia threw the balance in an unfavorable direction so far as his cardiac compensation was concerned. One might also consider the extension of a virus pneumonia to the myocardium, but such a viral myocarditis would not account for the antecedent history of increasing dyspnea over four or five years.

With regard to pulmonary embolism, one cannot be too sure. The sudden onset of dyspnea without pain and the delayed febrile response are quite like pulmonary embolism. The signs of infarction were not present, but this is dependent upon the amount of pulmonary congestion, and the shadow in the left hilum could well be pulmonary vessels brought into prominence by embolism. Also, there is the matter of the difference in size of the legs. It was not great and may have been of no significance whatever. A fatal pulmonary embolus is a large one, and the thrombosis of a leg vein responsible for a fatal embolus would be expected to produce more edema than was the case here. It is, however, the course of events which is unlike fatal pulmonary embolism. A large straddle embolus may cause death with such rapidity that the usual manifestations, dyspnea and cyanosis, do not have an opportunity to appear. Others go for longer periods when dyspnea, cyanosis, and shock do manifest themselves, and death is a more profound respiratory struggle, and the cardiac manifestations are those of acute cor pulmonale. Smaller emboli occlude only branches of the pulmonary artery and do not cause death, but such circulatory strain as they produce also falls upon the right-heart. There was no evidence of right heart strain here unless the small right axis deviation could be considered as such. This was the only evidence that could be regarded as indicating any degree of obstruction to the pulmonary circulation. Furthermore, once a pulmonary embolism has occurred and is survived, the patient improves, whereas this man steadily grew worse, but never with evidences of congestive failure until shortly before death, which came after four days. Again, a small and nonfatal pulmonary embolus might create sufficient embarrassment to an already damaged heart to tip the balance toward increasing failure.

As the consideration of the third possibility—was this patient's fundamental difficulty with his heart; it does not appear that he had a longstanding hypertension as his heart was not enlarged, but this does not preclude the possibility of arteriosclerosis of the coronary arteries. In the absence of chronic pulmonary disease to account for his increasing dyspnea over four or five years, one must conclude that his myocardium was at fault. One is struck by the lack of orthopnea as his dyspnea increased, and even more by its absence after entering the hospital here, but right-sided failure never was conspicuous until terminally, as indicated by the slight degree of increase in venous pressure. On the other hand, the circulation time was high on admission, and quite definitely increased during the remaining days of life. One would take this to mean that his heart was having difficulty in emptying itself, but had not yet reached the point of backward failure, with congestion of the venous circulation, or that the circulation of the lung was impeded. What then could produce such a state of myocardial inefficiency over so long a period to culminate in death in heart failure? At his age, one might still consider rheumatism, but in the absence of some evidence of valvular heart disease, much less cardiac enlargement, it would be remarkable to have extensive rheumatic myocarditis. One need not consider syphilis seriously for the Wassermann reaction was negative, and there was nothing to suggest either luetic aortitis or aortic insufficiency. In the rare instance of luetic myocarditis, in the absence of aortitis and aortic insufficiency, the heart has been found much enlarged and failure rapidly progressive. The only types of myocardial disease that would explain the picture are a nonspecific myocarditis—the so-called Fiedler's myocarditis—and arteriosclerotic heart disease, the latter the

result of coronary arteriosclerosis and the diffuse minute scarring that may ensue.

Fielder's myocarditis is an acute inflammation that runs its course with little or no fever, with evidences of stasis in both the greater and lesser circulations and, because of its insidious nature, its duration is by no means well defined. It would hardly seem reasonable that it would be so virulent as to run its course in five days, nor would it account for the increasing shortness of breath that the patient experienced over a period of four or five years. On the other hand, it is not unusual in coronary arteriosclerosis without hypertension to see areas of myocardial degeneration, with fibrotic change as their sequel, which is gradual in its development and which produces a steadily lowering myocardial reserve. Under such circumstances, the heart may or may not be enlarged, and the slowness with which this change develops, allowing collateral circulation to come into play, is a major determining factor in the size of the heart. Such a course of events would best explain what happened in this case. This man had experienced steadily decreasing myocardial reserve as indicated by his increasing dyspnea, but he never developed frank congestive failure.

Four days before death something more acute happened, characterized by extreme dyspnea which seemed much more than mere paroxysmal nocturnal dyspnea and suggested rather a pulmonary embolus or a myocardial infarction. There was no pain associated with this occurrence, and whereas pain is a usual accompaniment of myocardial infarction, it may be absent. Likewise, there was no specific electrocardiographic change. These are not essential, and one can be led astray when one refuses to make a diagnosis of myocardial infarction in the absence of specific electrocardiographic changes. The most disturbing feature in reaching such a conclusion is the size of his heart. With it definitely enlarged, this would be important, and White goes so far as to say that a very large infarct is always attended by cardiac enlargement.

In contrast, when the patient was admitted to the hospital, the heart sounds were described as distant and they steadily deteriorated in quality until they were described as "mushy." A protodiastolic gallop was present, which became increasingly more pronounced. Thirty-six hours after the event, he developed fever which continued, and there was some leukocytosis, but the time and nature of the febrile response would be in accordance with either a myocardial infarction or a pulmonary embolism. It seems to me that the weight of the evidence points to this patient's fundamental difficulty being myocardial rather than pulmonary, and that he had coronary arteriosclerosis with diffuse fibrosis rather than a nonspecific type of myocarditis, which occasioned a steadily decreasing myocardial reserve.

As a terminal event again, the weight of the evidence points to a pulmonary embolism as indicated by the sudden increase of dyspnea, the lack of pain, absence of specific electrocardiographic change but rather a tendency to right axis deviation, the delayed febrile response with some leukocytosis, and the possible source for an embolus in a leg vein. Following this added insult, myocardial failure ensued, causing his death four days later. This would account for the pulmonary shadow in the left hilum as prominent pulmonary vessels rather than to consider it an unrelated pneumonia or at most tipping the balance toward failure. With such an interpretation, it is not easy to explain the terminal lower abdominal pain unless it could be an embolism to an abdominal artery from a mural thrombus, for it takes but little failure for mural thrombi to form.

One cannot be too sure that he did not have a myocardial infarct, but the weight of the evidence seems to me against it. For me, it is difficult, however, to make the decision because the underlying changes thought to be present in the heart would certainly be conducive to myocardial infarction, but there is important evidence which seems to me to be lacking.

Discussion

Dr. Berthrong. Mr. Chairman, Ladies, and Gentleman: In spite of my lack of seniority before this audience and Dr. Wainwright, I must still fulfill a role of the pathologist which, at such a gathering, is to harass the clinician. I am sure this will be accepted without offense. Dr. Wainwright, of course I look at it in retrospect, but it seems to me as though a very prominent feature in this person's illness began as and continued to be dyspnea. This seemed to be completely out of proportion to the patient's chest signs and to his x-ray. In my recollection, most patients who die with left ventricular strain such as would be produced by chronic coronary insufficiency should show more pulmonary signs, should show rales at the base, should not show the severe dyspnea seen in this patient which was not increased by lying flat in bed. I don't recall patients with left ventricular failure exhibiting such manifestations. Would you comment on that?

Dr. Wainwright. Dr. Berthrong, that is quite true. It is very difficult to explain. I think sometimes that the amount of congestion in the lung is very variable; it may be minimal and scarcely detectable whereas at other times, it is very prominent,

and I must confess I'd be far more happy and feel far more secure in my conclusions about this man had he definite evidence of pulmonary congestion.

Dr. Berthrong. This is an extremely interesting case, not common, but I think it is not as rare as has been noted in the past. Autopsy showed an extremely obese white man who at the time of postmortem had intense cyanosis. This cyanosis was peculiarly noted in the face and upper extremities, and I do not have an explanation for that distribution. It was noted in Dr. Wainwright's discussion, and he emphasized it in discussing the development of pulmonary emboli, that one of the legs had an increased circumference. The measurement specifically showed that the right leg in the calf region and in the thighs was three to four centimeters larger than the left. I am not completely convinced that our postmortem data show that small variations in leg circumference are significant, but when it is as of great a difference as this patient exhibited, I am sure it may be of great importance. It was furthermore noted at postmortem examination that when the prosector attempted to milk blood from the veins of the right leg, none could be obtained. Unfortunately, we are not permitted to dissect the extremities, so we do not know what was in the leg veins. The heart was enlarged and weighed 450 grams. This enlargement was essentially limited to the right ventricle (**Figure 2**). In the major pulmonary arteries, adherent and fresh thrombi were seen (**Figure 3**). Microscopic sections showed organization of many of the large thrombi, extensive enough to suspect that the thrombi had been present for many weeks, even months (**Figure 4**). Other thrombi were quite fresh and obviously had occluded the small lumina remaining after the old thrombi had organized. These fresh thrombi, whether arising *in situ* or as

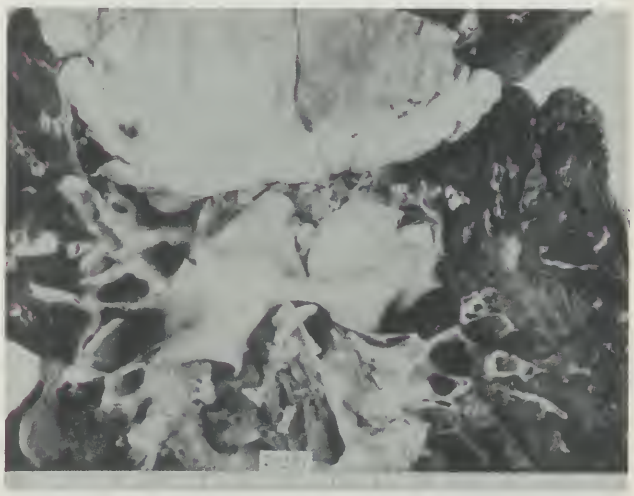

Figure 3. In the major pulmonary arteries, adherent and fresh thrombi were seen.

Figure 2. The heart was enlarged and weighed 450 grams.

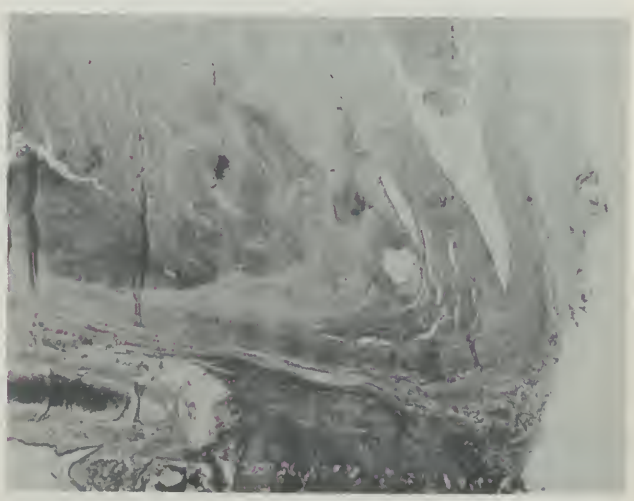

Figure 4. Microscopic sections showed organizations of many of the large thombi, extensive enough to suspect that the thrombi had been present for many weeks.

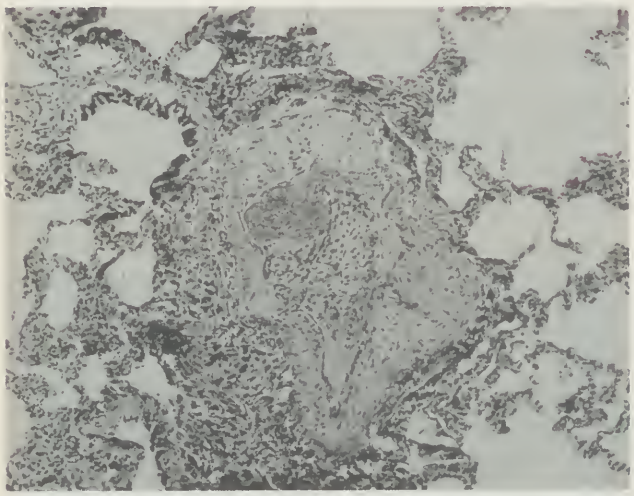

Figure 5. Smaller pulmonary arteries in the lung which contain partially organized thrombi.

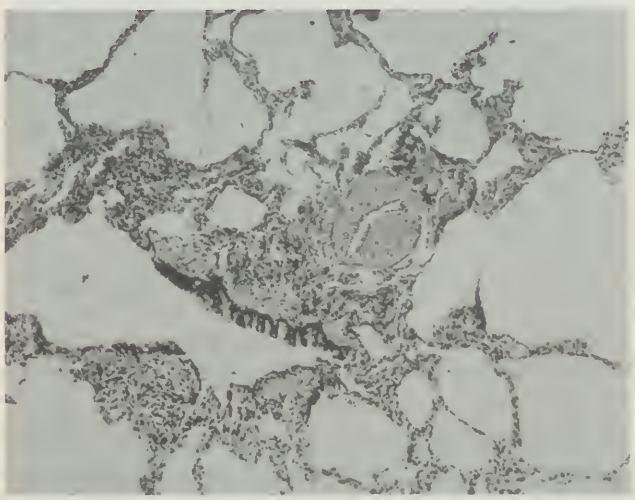

Figure 6. Marked arteriosclerotic changes in the smaller pulmonary arteries.

emboli, were doubtlessly the cause of the terminal episode that Dr. Wainwright correctly diagnosed.

Other sections showed smaller pulmonary arteries in the lung which contain partially organized thrombi (**Figure 5**). The pulmonary parenchyma was normal except for the presence of considerable anthracosis and occasional small silicotic nodules. Very interestingly, there were marked arteriosclerotic changes in the smaller pulmonary arteries (**Figure 6**). I say "arteriosclerotic" because these were typical of the pulmonary arteriosclerosis that is seen in so-called Ayerza's disease. It should be pointed out that these plaques of intimal proliferation were also compatible with old thrombi that had been completely organized and recanalized to leave small crescentic-shape lumina in these terminal pulmonary arteries.

We now can postulate that this patient, for some unknown reason, began to develop pulmonary embolization or thrombosis four or five months ago, which partially occluded his major pulmonary arteries. Smaller emboli occurred in smaller pulmonary vessels. Why he did not exhibit more of the clinical manifestations of chronic cor pulmonale is not entirely clear. The relationship of the mild but definitely pulmonary silicosis to these pulmonary thrombi cannot be clearly stated. We have had possibly 10 autopsies of cases of this syndrome in the past few years. It is becoming of increasing importance to recognize this peculiar clinical combination of severe dyspnea in the absence of prominent chest signs and often with cough and often with prominent hilar shadows by x-ray, which I think must represent dilated major pulmonary vessels proximal to the thrombi or even the vessels enlarged by the thrombi. All of the patients have not manifested an absence of orthopnea, but others have shown it as a prominent feature. Some of the patients are cyanotic, which is not always easily explained. In this patient, I think it is perfectly clear that as the right atrial pressure rose, there was an anatomical patency of the foramen ovale allowing a shunt of blood across from right to left and providing an easy explanation for the cyanosis. All of the patients have not had a patent foramen ovale, and the explanation of cyanosis is then not understood. The thrombus material has been found in the major pulmonary arteries in all of our cases, which has led to incomplete occlusion or stenosis of the major arteries. Since death did not occur immediately, symptoms developed later when the pulmonary stenosis resulted in right ventricular strain and eventual failure. The origin of the emboli has occasionally been found in the leg veins but in others, as in this case, no source for emboli or etiology for thrombosis has been discovered. Since left ventricular failure has usually not been present in these cases, pulmonary infarcts have not been seen.

Commentary

Summary of the NIH consensus statement on the diagnosis and treatment of early melanoma

Melanoma is the most lethal form of skin cancer, and its incidence has been increasing rapidly. It is estimated that, in the United States alone, 32,000 individuals will have developed melanoma in 1992, and 6,700 will die of the disease.

Early melanoma is extremely curable, but once the cancer has spread, treatment is usually ineffective. Potentially, most melanomas can be caught early because of their location on the skin surface. However, the specific criteria for diagnosing early lesions have not been completely agreed upon.

Appropriate treatment and follow-up of patients with early melanoma have also been the subjects of controversy. In addition, there has been considerable debate over the significance for later development of melanoma of skin lesions known as dysplastic nevi.

To evaluate current research on these subjects and resolve the major issues, the National Cancer Institute, the National Institute of Arthritis and Musculoskeletal and Skin Diseases, and the National Institutes of Health (NIH) Office of Medical Applications of Research sponsored a Consensus Development Conference on the Diagnosis and Treatment of Early Melanoma on January 27-29, 1992. Based on scientific presentations and discussions from physicians, scientists, and health care professionals, a 13-member panel wrote a consensus statement. Following are the panel's findings:

- The diagnosis of early melanoma (melanoma *in situ* and invasive melanoma < 1.0 mm measured depth) is important because
  - Melanoma *in situ* is a distinct diagnostic entity effectively treated surgically with 0.5 cm margins.
  - Thin invasive melanoma, < 1.0 mm in measured depth, has the potential for long-term survival in more than 90% of patients after surgical excision with a 1.0 cm margin.
- Minimal criteria for an acceptable pathology report for melanoma include diagnosis, depth of invasion (thickness), and status of margins.
- Elective lymph node dissections and extensive staging evaluations are not recommended in early melanoma.
- Patients with early melanoma are at low risk for relapse but may be at high risk for development of subsequent melanomas and should be followed closely.
- Some family members of patients with melanoma are at increased risk for melanoma and should be enrolled in surveillance programs.
- The use of "dysplastic nevus" as a clinical and histologic diagnosis is discouraged. The clinical lesions should be described as "atypical moles." Lesions with the appropriate constellation of microscopic features should be reported as "nevi with architectural disorder," accompanied by a statement describing the presence and degree of melanocyte atypia. The biologic significance of these nevi must be determined by the clinical features and family history of each case.
- The familial atypical mole and melanoma syndrome (FAM-M) is clinically recognizable. Individuals with this syndrome have an increased risk of developing melanoma. Careful surveillance of these patients is necessary.
- Education and screening programs have the potential to decrease morbidity and mortality from melanoma.
- The public should be made aware of (1) the increased risk of melanoma related to excessive sun exposure, particularly in childhood; (2) the clinical appearance of early melanoma; (3) the excellent prognosis associated with detection and treatment of early melanoma; and (4) the need for regular skin examinations by themselves and by their physician.

Early melanoma: diagnosis and treatment. A synopsis of conference findings with relevant literature citations

In late January of 1992, the National Institutes of Health (NIH) convened a Consensus Development Conference on Diagnosis and Treatment of Early Melanoma. Panel participants included dermatologists, pathologists, epidemiologists, and other health care professionals as well as experts in public education, surveillance techniques, and potential new technologies. The focus of panel discussions revolved around six questions on early melanoma. In the following paragraphs, I will list each question and, except for question six, will provide a synopsis of the panel findings citing

pertinent literature references where they apply. Additionally, clinical and histologic prognostic indicators of early melanoma will be discussed with question 1.

What are the clinical and histologic characteristics of early melanoma?

The ability to recognize early melanoma is critical since long-term, disease-free survival is >99% for patients with melanoma *in situ* and >90% for those with melanoma less than 1 mm in thickness.[1] The panel defined early melanoma as thin invasive lesions <1 mm in depth including melanoma *in situ* (MIS). Clinically, early melanoma is a flat or elevated lesion that exhibits the ABCD criteria of **A**symmetry, irregular **B**order, variegated **C**olor, and a **D**iameter of >6 mm.[2] Exceptions to these criteria exist, such as melanomas with uniform color and diameters <6 mm.[3-4]

A fully evolved melanoma in histologic terms was defined as a lesion exhibiting atypical melanocytes in cohesive clusters and single cells dispersed throughout the full thickness of the epidermis which, when invasive, forms an asymmetric dermal growth of nonmaturing, atypical epithelioid and/or spindled pleomorphic melanocytes with increased nuclear/cytoplasmic ratio and abundant eosinophilic cytoplasm. Mitoses, sometimes atypical, may be present in melanoma cells along with inflammatory host response, regression, angioinvasion, and satellitosis.

Although controversial,[5-7] MIS was histologically defined as melanoma confined to the full thickness of the epidermis and adnexal epithelium. Other vigorously debated clinical/pathologic terms for MIS were mentioned for completeness: lentigo maligna, atypical melanocytic proliferation, and pagetoid proliferation. Significantly, the panel stated that once completely removed, MIS should have **no** impact on a patient's longevity or insurability.

In its review of clinical and histologic prognostic indicators, the panel concluded that histologic depth of invasion was the feature most predictive for melanoma reoccurrence and prognosis. Other factors (e.g., ulceration, regression, anatomic location) may be considered, with ulceration being the second most significant.[1,8-13] At a minimum, the pathology report should include diagnosis, measured thickness (mm) of melanoma, and status of margins. Other factors mentioned above may be reported as suggested in a recent publication outlining a statistical method for predicting survival in stage I melanoma.[8]

What is the appropriate diagnosis, management, and follow-up of patients with early melanoma?

In the initial surgery of a suspected melanoma, an appropriate excisional or incisional biopsy submitted in fixative (formalin) is critical to the diagnosis and microstaging of the lesion. Once diagnosed, the patient should undergo a history and physical to identify risk factors, possible signs and symptoms of metastases, atypical moles, and other melanomas. Current recommendations for surgical therapy of early melanoma are 0.5 cm for MIS and 1 cm for thin invasive melanomas <1 mm in thickness.[14-16] Elective regional lymph node dissection is not indicated in early invasive melanoma.[17]

After treatment of early melanoma, should patients and family members be followed: why and how?

Postsurgical follow-up of early melanoma is important since long-term survival is excellent and the risk for another melanoma is significant (3%–8%).[18] Follow-up becomes especially important in patients with atypical moles (discussed below) since there is increased risk in this patient population, particularly in melanoma-prone families.[19] Follow-up includes interval examination of patient's skin, including the removal site, as well as regional lymph nodes where possible. Interval times vary from every six months for patients without atypical moles to three to six months for those with this risk factor. Photographic documentation of atypical moles for subsequent follow-up comparison may be useful, and patient counseling in monthly self-examination of the skin, avoidance of excessive sun exposure, and sunscreen protection is helpful. Because familial melanoma is an important risk factor for the development of melanoma, it may be worthwhile to screen first- and second-degree relatives of all patients with melanoma.[20] Even though MIS has little risk for relapse, prudence dictates follow-up of these patients with serial skin examinations including the removal site.

Do dysplastic nevi exist and what is their significance?

"Dysplastic nevus" is a term formerly used to describe acquired pigmented lesions of skin different in histological and clinical appearance from normal moles and which may be sporadic or familial.[21-24] Because the terms "dysplastic nevus" and "dysplastic nevus syndrome" are controversial, their use is discouraged and "atypical mole" and "familial atypical mole syndrome (FAMS)" are recommended instead.

Atypical moles are variable in size (often larger than common moles), color, and border, and frequently found on the trunk. FAMS is defined by families with one or more melanomas in first-degree relatives; large number of moles, frequently atypical, in affected kindred; and moles exhibiting certain histologic characteristics.[21-28]

An atypical mole is generally diagnosed using histologic criteria of architectural disorder with asymmetry (compared with junctional and compound moles), lentiginous melanocytic

hyperplasia with variably sized spindle and epithelioid melanocytes that fuse with adjacent rete ridges to form bridges, subepidermal concentric and lamellar fibroplasia, and variable superficial dermal perivascular infiltrate. Interobserver reproducibility in defining melanocytic nuclear atypia in dysplastic nevi is the crux of the problem. Because the terms dysplasia and "dysplastic nevus" are so controversial,[22,25-30] the panel recommends these lesions should be histologically described as "nevi with architectural disorder" (i.e., junction or compound nevus with architectural disorder). A statement as to presence and degree of melanocytic atypia should be included. The panel also recommended that a reproducible schema for diagnosing and reporting these nevi should be formulated. Incompletely excised atypical moles should be reported by the pathologist and, if indicated, re-excision with 2-5 mm margins is appropriate.

Identifying FAMS patients is important because of the markedly increased risk of developing melanoma throughout their lifetime. The need for increased surveillance in this group of patients is obvious. Surveillance is defined as physician follow-up at four to six month intervals, possibly including high quality body photographs. Patient education and self-examination are equally important. *De novo* or pre-existing moles should be appropriately biopsied if change occurs in asymmetry, border, color, or diameter.[18,20-21]

Occurring in the general population are nonfamilial atypical moles that are clinically and histologically identical to the familial variant.[22,24] The relative risk of melanoma in this group of patients as compared with the familial variant is less but still significant (7%).[19] Surveillance of sporadic atypical mole patients is recommended, but studies are needed to define the necessary time interval.

What is the role of education and screening in preventing melanoma morbidity and mortality?

By the year 2000, one out of every 75 white Americans will develop a melanoma in his or her lifetime.[31] The role of education and screening in preventing melanoma morbidity and mortality becomes paramount. Ongoing public education through mass media campaigns, educational campaigns in schools, work sites, and other community settings, as well as physician and health care provider education of patients in recognizing early melanoma and its risk factors are critical.[20,32] Specifically, patients and the public should be made aware of the increased risk of melanoma related to excessive sun exposure particularly in childhood, the clinical appearance of early melanoma, the excellent prognosis associated with detection and treatment of early melanoma, and the need for regular skin examinations by themselves and their health professionals.

What are the future directions for research including primary prevention?

The consensus panel explored 14 future clinical, biological, and public health directions for research of early melanoma including primary prevention (risk reduction). The reader is referred to the consensus statement booklet issued by the National Institutes of Health for the future directions of research as well as the full text of the consensus panel's statement.

Summary

In summary, 13 panelists and 23 featured speakers convened in late January 1992 in an attempt to define early melanoma clinically and histologically; develop treatment guidelines including follow-up for early melanoma; wrestle with the controversial issues of dysplastic nevus and dysplasia; formulate plans, present and future, for public education and screening of early melanoma; and list future directions for research and primary prevention in early melanoma. The panel accomplished its goals all within the incredibly short time of three days (January 27-29, 1992). While criticism has been raised with regard to the panel's findings,[32] the medical community owes a debt of gratitude to the participants for the selfless giving of time, energy and expertise.

Dr. Taylor is assistant professor of pathology and dermatology, Johns Hopkins University School of Medicine, and is in the private practice of dermatology. ■

THE UNION MEMORIAL

CURTIS Hand Center

The Raymond M. Curtis Hand Center

is pleased to announce the opening of

The Congenital Hand Deformities Clinic

This clinic is staffed by Hand Specialists of The Union Memorial Hospital.

Patients are seen on the third Friday of each month beginning at 4:00 p.m.

You are welcome to attend with your patient if you so desire.

For Appointments Please Call:

The UMH Hand Associates Office
The Union Memorial Hospital
Professional Building, Suite 337
201 East University Parkway
Baltimore, Maryland 21218-2895
(410) 235-5405
FAX: (410) 467-5459

Auxiliary

Another way to save a life

In 1989, J. Everett Koop M.D., then US Surgeon General, urged the medical community to become more involved and responsive to domestic violence in our country. He said, "Physical abuse of women and children is an overwhelming moral, economic, and public health burden." That is an understatement.

Last September, the *Washington Post* published the Yale University study on the statistics of violence against women. Between 1979 and 1987, 5,632,400 cases of family violence were reported in the United States. Since women and physicians are reluctant to report such events, complete figures are difficult to obtain. These statistics are limited to serious assaults such as those that occur with the use of a weapon. Punching, kicking, throwing, choking, and other physical methods are seldom reported unless they lead to serious medical injuries.

Here are some startling facts about family violence of which you may not be aware:

- Domestic violence touches one fourth of all American families at all levels of society.
- Every 15 seconds a women is beaten by her husband or boyfriend.
- One fifth to one half of all American women were sexually abused as children, most of them by an older male relative.
- Battering is the single most common source of injury to women—more common than the combined number of auto accidents, muggings, and rapes by strangers.
- One of every two American women will be beaten at least once in the course of an intimate relationship; 75% of women who are battered are divorced or separated from their abusers at the time of the incident.
- Approximately 35% of women who visit the emergency room are there for symptoms related to ongoing abuse; as few as 5% of the victims are identified as such.
- Thirty percent of the women killed in the United States die at the hands of a husband or boyfriend.

Heartbreaking are the additional statistics on children:

- Last year, 1,383 children in the United States were killed by abuse. More than half of these children were under the age of one.
- Child homicide is now one of the five leading causes of death in childhood; the majority of infant victims were killed by parents, relatives, or older children.

These are not statistics of a foreign country at war. This is more than just a "public health burden." These are Americans beating and killing their families!

With these facts and the realization that medical costs for domestic violence are over $44 million annually, it is no wonder that the American Medical Association (AMA) kicked off the *Physician Campaign Against Family Violence* in October 1991.

What physicians can do

Antonia C. Novello, M.D., M.P.H., surgeon general, wrote in the June 1992 *JAMA*:

> Domestic violence is an extensive, pervading, and entrenched problem in the United States. It is an outrage to women and the entire American family....
>
> As health professionals, we must make an effort to end domestic violence, both inside and outside the home. Our awareness, our intolerance of violence, and our active intervention can greatly diminish the license for domestic abuse. As professionals, we can make a remarkable difference.

Here is what Dr. Ann Flitcraft, assistant professor of medicine at the University of Connecticut and co-director of the New Haven–based domestic violence training project, recommends physicians do (*JAMA*, August 1990):

1. We need to identify domestic violence, to name it as a problem, and to acknowledge that we share the same concern that (the patient) has.... The very acknowledgment that domestic violence is going on and that you and (the patient) agree it is a serious problem is very powerful and a therapeutic first step.
2. Physicians can assess the woman's safety by asking about the extent of the violence she faces, whether there are weapons involved, whether the children are being threatened, and if she has a safe place to go.
3. Physicians can provide patients with information about legal and community sources available for battered women and their children.
4. Above all, we need to support the decisions [the patient] makes to best end the violence in her life....

Flitcraft summarizes by saying, "Quicker than you can

put on a Bandaid, you can acknowledge the violence, you can assert that this is illegal, not her fault, and that a lot of women are in this situation.

"You can educate her about community-based resources available to help her and ask, 'Are you safe?' These are the important elements that affirm that violence is a problem and a threat to her mental and physical health. It is more important than whether she comes back to get her stitches out on Tuesday or Wednesday."

Other recommendations that may also be helpful include

- Provide information packets in the examination room. If placed in the waiting room or lobby, a woman might not pick them up and read them in front of others
- Encourage your patients, and provide the phone numbers, to call local shelters, safe houses, and legal services for information regarding counseling and support groups. If patients do not respond the first time, give them a second chance. Keep your door open to them.
- Be sure it is you, not your office staff, who provides this most confidential information to your patients.
- Ask your county medical society and auxiliary to put together information packets to be distributed to all physicians in your county.

All physicians see abused patients, not just emergency room doctors. Violence in the home can manifest itself in ways such as abdominal pains, sleeping and eating disorders, depression, chronic headaches, joint pains, chemical dependency, and suicide attempts. So the next time a woman comes to see you who you suspect may be a victim of this terrible violence epidemic, ask her, "Are you safe?" Give her the medicine she really needs—information for a way out of her situation. It may be the prescription that saves her life.

Another Kind of Investment. It's Boring!

With this investment, you get no black tie...no sip of Dom...no rush of watching dice bound over the green felt. So, if the thrill of the gamble drives your investing, we can't dance. Our investment is boring. For us there are no administrative costs and no sales commissions. But for our investors, there are no anxious moments. For our investors, the average annual yield over the past five years has exceeded 10%. But their investment is nap-inducing. Our investors watch the mailbox (rather than the agate print in The Wall Street Journal) to measure their gains, because each of them receives a monthly check. But they yawn all the way to the bank. You see, with a 1% risk factor in this investment, the gamble simply isn't there. That's why we never get to dance with the high rollers who love the epinephrine flow that comes with the gamble. For more information about this ho-hum investment, call toll free: 800/876-6784.

The Maryland Medical Journal (MMJ) *is a monthly publication of the Medical and Chirurgical Faculty of Maryland. The journal's goals are educational and informative: the publishing of scientific articles (original research, case studies, and review articles) and other technical information, as well as editorials, letters, special articles (evaluations, position papers, reviews of nonscientific subjects), membership and legislative news, continuing medical education notices, and programs and policies of the faculty.*

Information for AUTHORS

- ***Letter of transmittal***—The letter of transmittal, which all authors must sign, should include the full names, degrees, titles, and affiliations of all authors, and the name, address, and phone number of the author to whom reprint requests and correspondence should be sent.

  The letter should include a statement to the effect that all authors have participated in the conception and design of the work and in the writing of the manuscript, and that they take public responsibility for it. The authors should attest to the validity and legitimacy of the data, and acknowledge that they have reviewed the final version of the manuscript and approve it for publication.

  In addition, the letter must include a paragraph that transfers copyright ownership to the *MMJ* in the event that the work is published.

- ***Manuscript preparation***—Manuscripts should be submitted to Editor, *MMJ*, 1211 Cathedral Street, Baltimore, MD 21201-5585. Manuscripts must be original material not previously published and not under consideration by another publication. An abstract of 100 to 300 words is required.

  All material, including references, tables, and legends, must be double-spaced. Pages should be numbered. (All abbreviations should be spelled out on first use.) The original manuscript plus one copy should be submitted on standard (8.5" x 11") bond paper. If at all possible, an IBM-compatible disk should be included, with the manuscript entered in a WordPerfect, Multimate, Wordstar, or ASCII format; the transmittal letter should identify the format used.

- ***References***—References are limited to those citations noted in the text. References should be numbered consecutively as they appear in the text and should be kept to a minimum (fewer than thirty-five). Personal communications and unpublished data are not acceptable. At a minimum, references should include names of all authors, complete title of the article cited, name of journal abbreviated according to *Index Medicus* (if abbreviation is not known, journal name should be spelled out fully), year of publication, volume number, and first and last page numbers. Sample references are as follows:

  1. Stevens MB. The clinical spectrum of SLE. Md Med J 1991; 10:875–85.
  2. Ropes MW. Characteristics, manifestations, and pathologic findings. In: Ropes MD, ed. Systemic Lupus Erythematosus. Cambridge, MA: Harvard University Press. 1976; 50–4.

- ***Tables***—Tables should be typed on separate sheets of paper, be numbered, and have a brief descriptive title. Data presented in tables should be self-explanatory and should supplement, not duplicate, the text; the Editor reserves the right to edit tables. Authors should be sure that statistics are consistent in both tables and text.

- ***Illustrations***—Illustrations include material that cannot be set in type. Photographic material must be submitted as high-contrast, glossy prints. Drawings and graphs must be done professionally in india ink on high-grade white drawing paper or be computer generated. Identification—including figure number, the title of manuscript, the name of corresponding author, and arrow indicating top—should be typed on a gummed label and affixed to the back of each illustration. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs or drawings. Recognizable photographs of patients are to be masked and should carry with them written permission for publication. Cost of printing color photographs must be borne by the author.

Checklist

- ☐ Original manuscript and one copy.
- ☐ IBM-compatable disk in WordPerfect, Multimate, Wordstar, or ASCII.
- ☐ Everything double-spaced.
- ☐ Letter of transmittal, signed by all authors, that includes release of copyright, statement of authorship responsibility, title and affiliation of all authors, and identification and phone number of corresponding author.
- ☐ Abstract of 100 to 300 words.
- ☐ Permission-to-borrow letters for any previously published illustrations or tables

- ***Permissions***—Material taken from other sources must be accompanied by written permission from both author(s) and publisher allowing the *MMJ* to reproduce the information/figure.

- ***Editorial responsibility***—All manuscripts are acknowledged upon receipt. They are subject to peer review by an editorial board and, at times, by guest reviewers in appropriate fields of medicine, to determine the originality, validity, and importance of the content and conclusions. Authors are usually notified of the status of their papers (acceptance, revision, or rejection) within 4 to 8 weeks of receipt; however, longer delays are sometimes unavoidable. Reviewers' comments will be returned with rejected manuscripts at the discretion of the Editor. All guest reviewers will remain anonymous.

  Accepted manuscripts become the permanent property of the *MMJ* and are subject to copy editing. (The *Chicago Manual of Style* and the unabridged *Random House Dictionary of the English Language* are used as style guides.) The corresponding author is sent a reprint order form and galley proofs. S(he) then has 48 hours in which to make minor changes and clear all corrections and changes with co-authors; if proofs are not returned by the specified date, they will be considered approved as typeset. ■

Control of biohazards in the research laboratory, at the Hampton House Auditorium. Info: Dr. Jacqueline Corn or Linda Lamb, 410-955-2609. — **June 21-25**

Coordination and monitoring of clinical trials. Cat 1 AMA/PRA credits available. — **July 8-9**

Symposium on bone marrow transplantation—Current concepts and future directions. 7 Cat 1 AMA/PRA credits. Fee: $40. — **July 16**

2nd annual update on obstetric anesthesia plus an optional fiberoptic airway management workshop, at the Hyatt Regency Inner Harbor, Baltimore, Maryland. 12 Cat 1 AMA/PRA credits. Fee: $275 physicians; $175 CRNAs; $75 residents and fellows. — **Aug. 21-22**

Airway management/fiberoptics, patient care and dissemination of critical information. Cat 1 AMA/PRA credits available. Fee: $650. — **Sept. 10-12**

7th annual core content of emergency medicine: A comprehensive review, at the Marriott Hotel, Baltimore-Washington International Airport, Baltimore, Maryland. Cat 1 AMA/PRA credits available. Fee $995. — **Sept. 10-16**

22nd annual diagnostic ultrasound in gynecology and obstetrics and abdomen, at the Stouffer Harborplace Hotel, Baltimore, Maryland. 16.5 Cat 1 AMA/PRA credits. Fee: physicians: 3 days, $400; 2 days, $300; 1 day, $150. — **Sept. 17-19**

Diabetic retinopathy. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. — **Oct. 29**

Practical management of the uveitis patient. 8 Cat 1 AMA/PRA credits. Fee: $200 physicians; $100 residents, fellows, and allied health professionals. — **Oct. 30**

Continuously throughout the year

Visiting preceptorship in pediatric critical care medicine. Ongoing five-day preceptorship by appointment. 40 Cat 1 AMA/PRA credits. Fee: $600.

The department of radiology and radiological sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams, 410-955-3169.

Visiting physicians. Offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. 40 Cat 1 AMA/PRA credits. Fee: $500.

Johns Hopkins medical grand rounds. Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics per year in five bimonthly programs. Individual and group subscriptions. 40 Cat 1 AMA/PRA credits. Info: 410-955-3988.

Miscellaneous meetings

Maryland Academy of Family Physicians 45th annual meeting and scientific session, at the Princess Royale Oceanfront Hotel and Conference Center, Ocean City, Maryland. 41.25 Cat 1 AMA/PRA credits; 41.25 AAFP prescribed hours. Fee: $240 members; $275 nonmembers; $135 paramedicals; No charge for residents, medical students, MAFP retired and life members. Info: Francis C. Bruno, M.D., 410-747-1980. **May 18-23**

6th annual trauma anesthesia and critical care symposium, sponsored by the International Trauma Anesthesia and Critical Care Society (ITACCS) and Multinational Academic Consortium, at the Hyatt Regency, Baltimore, Maryland. Info: Kimberly C.A. Unitas, 410-328-2399. **May 20-22**

Virginia Society of Ophthalmology annual meeting, at the Norfolk Marriott Waterside, Norfolk, Virginia. Info: Donna Scott, 804-353-2721. **May 21-22**

Death and dying: The physician's trials and tribulations, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **June 3**

Systemic lupus erythematosus update for primary care physicians, sponsored by the Maryland Lupus Foundation and the University of Maryland School of Medicine. 5 Cat 1 AMA/PRA credits; 5 AAFP prescribed hours. Fee: $75.00. Info: 410-337-9000. **June 5**

9th annual Eastern Virginia Medical School family medicine review course, at the Cavalier Hotel, Virginia Beach, Virginia. Info: 804-446-6140. **June 6-11**

Substance abuse education for primary care physicians: An overview of treating the substance abusing patient, sponsored by the Medical and Chirurgical Faculty of Maryland, at the Mercy Medical Center, Baltimore, Maryland. 1 Cat 1 AMA/PRA credit; 1 AAFP prescribed hour. Fee: none. Info: Carmine M. Valente, Ph.D., 410-539-0872 or 1-800-492-1056. **June 9**

Board review in family practice, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 41 Cat 1 AMA/PRA credits. Fee: $625 physicians; $495 residents and fellows; $395 allied health professionals. Info: John F. Vargo, 202-994-4285. **June 12-16**

INMEDs fourth annual millennium conference, sponsored by the International Medical Services for Health (INMED) and the Tulane University School of Public Health and Tropical Medicine, Sheraton City Centre Hotel, Washington, DC. Info: 703-444-4477. **June 15-18**

11th summer symposium in internal medicine, at the Fort Magruder Inn & Conference Center, Williamsburg, Virginia. Info: 804-446-6140. **June 25-27**

16th annual flap dissection workshop, at the Virginia Beach Conference Center, Virginia Beach, Virginia. Info: 804-446-6140. **July 6-10**

Imaging the augmented breast, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **Sept. 2**

1993 Med Chi semiannual meeting, at the Sheraton Ocean City Resort and Conference Center, Ocean City, Maryland. Info: Vivian Smith, 410-539-0872 or 800-492-1056. **Sept. 10-12**

The decade of the brain: An international conference, sponsored by the George Washington University, at the Omni-Shoreham, Washington, DC. 28 Cat 1 AMA/PRA credits. Info: John F. Vargo, 202-994-4285. **Sept. 11-14**

5th annual trauma conference, sponsored by the Peninsula Regional Medical Center, at the Sheraton Ocean City Resort and Conference Center, Ocean City, MD. Info: Darlene Kwiatkowski, 410-543-7328. **Sept. 16-17**

14th international congress of lymphology, sponsored by the International Society of Lymphology (ISL). Part 1: "Frontiers in Lymphology" at the Hyatt Regency, Baltimore, Maryland. Part 2: "Lymphology in 1993" at the Ramada Renaissance Techworld, Washington, DC. Info: Grace Wagner, Program Coordinator, 602-626-6118. **Sept. 20-26**

International liver symposium, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. Info: Daniel E. Reichard, 202-994-4285. **Oct. 1-3**

Causes of the medical malpractice crisis, sponsored by the Baltimore City Medical Society. 1 Cat 1 AMA/PRA credit. Fee: none. Info: 410-625-0022. **Oct. 7**

Gastroenterology board review course, sponsored by the George Washington University, at the Marriott Crystal Gateway Hotel, Arlington, Virginia. 42 Cat 1 AMA/PRA credits. Fee: $625 physicians; $500 residents and fellows. Info: Daniel E. Reichard, 202-994-4285. **Oct. 9-13**

Medical oncology board review course, sponsored by the George Washington University, at the Ritz-Carlton, Pentagon City, Virginia. Info: John F. Vargo, 202-994-4285. **Oct. 9-13**

7th annual national disability management conference and exhibit, sponsored by the Washington Business Group on Health, at the Crystal Gateway Marriott, Arlington, Virginia. Info: Kristina Tanasichuk, 202-408-9320. **Oct. 25-26**

Continuously throughout the year

Fluorescein angiography conference, sponsored by the Retina Center, St. Joseph Hospital, Baltimore, Maryland, first and third Mondays of each month; 8:00-9:00 am. Fee: none. Info: R. Classon, 410-337-4500.

DIRECTORSHIP OF NEW HOSPITAL EMERGENCY DEPARTMENT:

The Atlantic General Hospital, serving the community on Maryland's Eastern Shore, will open its doors in May of '93. Professional Emergency Physicians is seeking BC/BP physician, residency trained in Emergency Medicine, for Director of new hospital Emergency Department starting in the Spring of 1993. Excellent salary and benefits with partnership in our emergency medicine physician owned corporation. Send C.V. to Search Committee, James A. D'Orta, M.D., 199 Lionhead Court, Baltimore, MD 21237, Fax or Tel: (410) 686-2124.

Shady Grove Adventist Hospital,

9901 Medical Center Drive, Rockville, Maryland. Info: 301-279-6115.

Long-term problems after repair of congenital heart disease	May 6
TMJ pain; fact or fiction	May 13
The vascular surgeon and the diabetic foot	May 20
Tumor board conference	May 27
Medications errors and how to avoid them	June 3
Controlling multiple coronary risk factors in clinical practice	June 10
How to get paid in accident cases	June 17
Tumor Conference	June 24

PHYSICIAN'S RECOGNITION AWARD

During March 1993, the physicians listed below received the American Medical Association (AMA) Physician's Recognition Award. Established in 1968, the award's purpose is to encourage physician participation in continuing medical education and to recognize those physicians who have voluntarily completed programs of continuing medical education.

Consultation, a weekly radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on WBAL to discuss the lastest developments in medicine and to answer questions about health issues. Med Chi currently airs the following program of Consultation weekly:

Sunday Morning Consultation
A half-hour program
Interview format: one-on-one talk with John Stupak
Pretaped Wednesday evenings from 7:30 p.m. - 8:00 p.m.
Play back is on WBAL-AM radio Sunday mornings at 9:30 a.m.

To speak out, fill in the form below.

Animal Rabies in Maryland in 1992

May, 1993

In 1992 laboratory confirmed animal rabies in Maryland decreased by 4.5% following 3 consecutive years of increase (Table 1). There were 26 fewer cases in 1992 (553) than in 1991 (579). The trend of animal rabies in Maryland in the past 13 years is shown in Figure 1.

Dorchester and Wicomico counties on the lower Eastern Shore became the 21st and 22nd jurisdictions to become involved in the current rabies epizootic of terrestrial animals (e.g., animals other than bats). Dorchester County reported 55 animal rabies cases since the initial case occurred in May, and Wicomico County reported 33 cases between June and the end of 1992.

The first rabid animal reported in each county was a raccoon. Reported cases in Dorchester County included 44 (80%) raccoons, 10 (18%) skunks, and one bat. Wicomico County recorded 23 (70%) raccoons and 10 (30%) skunks.

Talbot County, which was the only county newly involved in 1991, reported 54 cases in 1991 and 63 cases in 1992. A tendency for the largest number of rabies cases to be recorded in the first full calendar year of involvement has been observed in other jurisdictions. Frederick County, recorded a third cyclic peak of 79 rabid raccoons in 1992, which was eight years following an initial peak of 247 cases in 1984 and 66 cases in a second peak in 1988. Cyclic peaks usually occur at 4 to 6 year intervals in Maryland's jurisdictions although exceptions are seen. When the total number of cases is small year after year, expected fluctuations are difficult to recognize. Therefore, it is not always possible to clearly identify subsequent cyclic peaks.

Data Collection

Rabid animal cases are laboratory reported rabid by the direct immunofluorescent antibody (also known as DFA or fluorescent antibody test, or FAT) staining of brain material submitted to the Maryland Department of Health and Mental Hygiene and Maryland Agriculture Department laboratories and the Army Medical Laboratory at Ft. Meade. Many rabid animals go untested or undetected. Therefore, the cases reported are a crude indication of the prevalence of the disease and do not indicate the extent of viral infection within wild animal populations.

Rabies in Wild Animals

Wild animals accounted for 95.5% of all reported cases of animal rabies in 1992. The 527 cases represented a 5.7% decrease as compared to the 559 cases in 1991. Raccoons continue to be the most frequently reported rabid animal (74.7% of all animal cases [553] during 1992), followed by skunks (11.8%), foxes (4.9%), bats (3.1%), and groundhogs (1.1%).

Rabies in Domestic Animals

Of all rabid animals reported in Maryland, 25 domestic animals accounted for only 4.5% of the total. The cases represented an increase from the 18 (3.1%) 1991 domestic cases. Cats continue to be the most frequently reported domestic animal with rabies. Twenty-two cats (3.9% of all animal cases) is the largest number of rabid cats ever reported and this is an increase over 15 (2.6%) rabid cats in 1991. There were 2 (0.4%) rabid dogs reported, the same as in 1991. One horse was reported rabid in 1992 and 1 in 1991.

Seasonal Trends

A number of factors must be considered when evaluating seasonal trends in the number of reported cases of rabies in animals. First, rabies surveillance is largely passive and tested animals have usually behaved

in a manner that is unusual for the species. Second, seasons when human outdoor activity is greatest (e.g., summer) allow the greatest opportunities for contact with potentially rabid animals. Finally, surveillance varies for various reasons ranging from economic to political.

Raccoons and skunks have broadly similar distributions, with major peaks of reporting during the late winter-early spring (March-May) and again in the fall (October). A minor third peak often is apparent in late summer but is largely static over the summer and is lowest in January and February. Reports of rabid bats peak in summer and early fall (July to October).

Human Rabies

No human rabies has occurred in Maryland throughout the raccoon rabies epizootic which began in 1981. The most recent human rabies death resulted from a bat bite in 1976. In 1945, a human rabies death resulted from an exposure to a dog during a period in history when human rabies deaths were more common in the United States and usually the result of dog exposures.

Human Rabies Imported into France

Reference: CDC. MMWR. 1992:41: 953-4.

On May 9, 1992 a 3-year old boy who lived in Algeria died of rabies encephalitis in Paris. On March 17 the boy was chased by a dog in his village, fell and sustained a wound on his forehead. Witnesses confirmed that the wound resulted from his fall and that he was not bitten or licked by the dog. No treatment was started. The boy remained well until April 15 when he complained of headache and was hospitalized in Algeria on April 19 with agitation, hyperthermia, aerophobia and hydrophobia. On April 23 the boy was transferred to an intensive care unit in a hospital in Paris with suspected viral encephalitis of unknown origin.

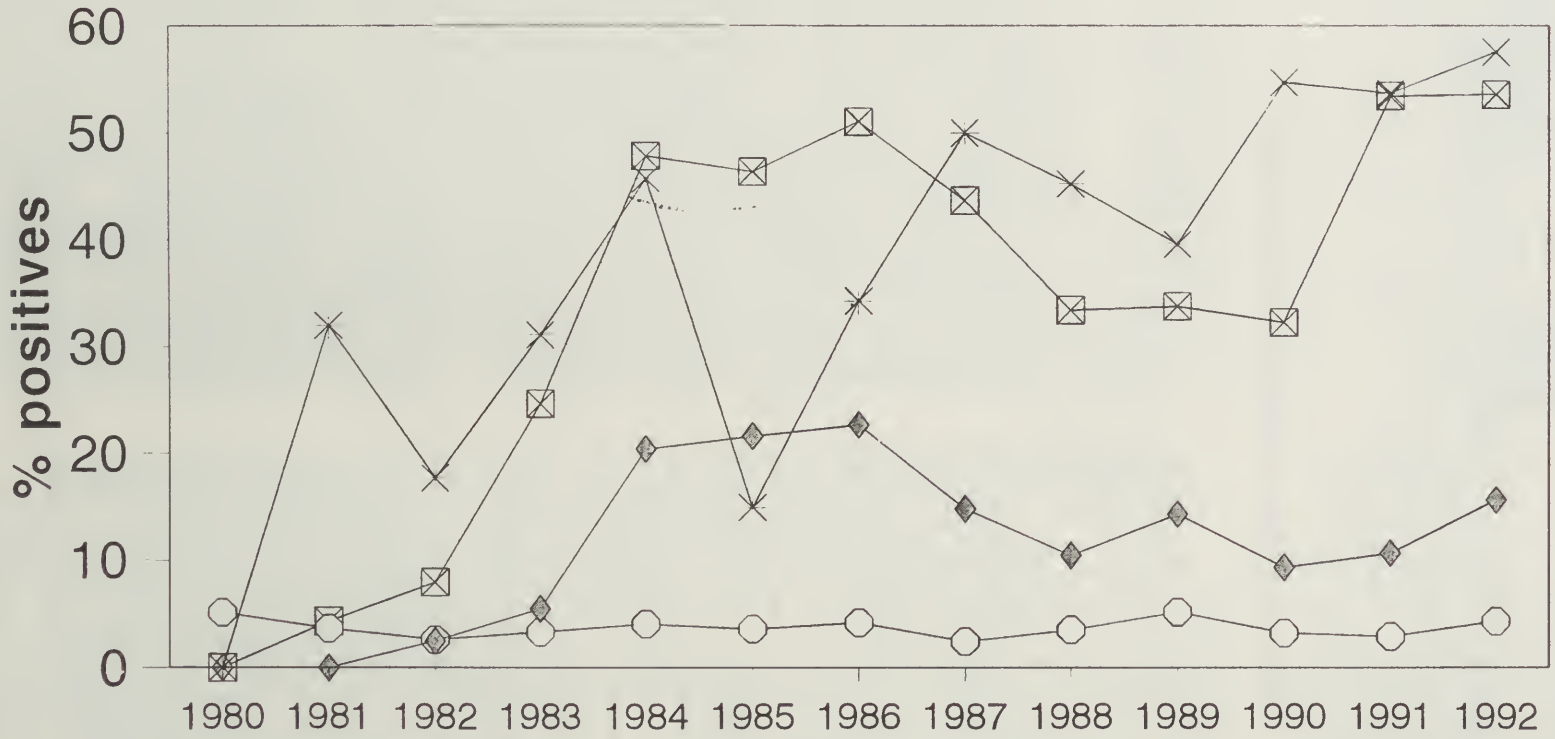
Tests for rabies antibody in serum and cerebrospinal fluid (CSF) on April 24 were negative. On April 30 he became comatose and was placed under respiratory monitoring. He received external cardiac pacing after atrioventricular dissociation. Daily electroencephalographic monitoring showed decreasing brain activity. He died on May 9, 25 days after onset of symptoms and 17 days in the intensive care unit.

A second serum sample obtained on May 5 was positive for rabies antibody and the antibody titer increased daily until death on May 9. Neck skin biopsies and corneal smears performed on May 5 and 9 were negative by fluorescent antibody test (FAT). CSF samples obtained on April 24 and 27 and on May 5 and 9 were negative for rabies antigen detection by rapid rabies enzyme immunodiagnosis (RREID) test. However, the CSF sample obtained on May 9 was positive for rabies antibody. Saliva samples were obtained daily from May 5 through 9. The samples of May 7 and 9 were positive by RREID on cell sediment. Complete autopsy was not authorized by the family but a postmortem retro-orbital brain sample confirmed rabies diagnosis by FAT, isolation on neuroblastoma cells, RREID, and mouse inoculation test.

Postexposure rabies prophylaxis was administered to 143 hospital staff and family members in Paris. The exact data about the numbers of persons given rabies treatment in Algeria are not available.

Investigations in the boy's hometown revealed that the dog that chased him in March did not remain healthy, as reported to the family, but died (or was killed) shortly after the incident.

Note: Although rabies has been enzootic in red fox in France since 1968, human rabies is rarely acquired in that country. Northern Africa accounts for most cases imported into France and in every case the vector animal was a dog. Worldwide, dogs are responsible for more than 90% of human cases. In this case, no dog bite was documented but the putative short incubation period (29 days) is consistent with an exposure to the upper body. The boy might have received other unreported bites or exposures to rabies virus.



The early manifestations of rabies are usually nonspecific and can be difficult to differentiate from other encephalitic diseases. There are two distinct presentations: the most common furious form, characterized by hydrophobia, aerophobia, or episodic agitation and anxiety; or the least common paralytic form. Rabies should be considered in any patient with rapidly progressive encephalitis of unknown etiology.

Rabies postexposure prophylaxis is recommended for all persons bitten or scratched by animals that may be rabid. Rabies rarely results from exposures other than bites, scratches, or contact with mucous membrane or an open wound with infective saliva when bite or mucous membrane exposure cannot be excluded, postexposure treatment should be given to persons who have had physical contact with rabid animals. Treatment should be initiated as soon as possible after bites or scratches by known or suspected rabid animals. Immediate and thorough washing of all bite wounds and scratches with soap and water is an important measure for preventing rabies.

Exposure to humans with rabies has not been implicated as a means of rabies transmission except following cornea transplant from donors who died of rabies. Casual contact with a person with rabies (i.e., touching the patient) or contact with noninfectious fluids or tissues (e.g., blood, urine, feces) does not constitute an exposure and is not an indication for prophylaxis.

PHYSICIAN

Prison Health Services, Inc., a growing national leader in correctional health care management, has a position available at the Maryland Division of Correction/Eastern Correctional Inst. for a full-time physician. This position requires that the qualified individual must be board eligible or certified in Family Practice or Internal Medicine and licensed or able to obtain licensure in the state of Maryland. We provide an excellent benefits package. For confidential consideration, contact Dr. Eric Sohr at 410-651-9000, ext. 4239. "We are an Equal Opportunity Employer. We do not discriminate on the basis of race, religion, color, sex, age, national origin or disability."

PART-TIME PHYSICIAN

Needed for LTC facility. Call Dr. Rifkin at 410-356-6504.

PHYSICIANS WANTED

Semi-retired or retired OK/physicians for pleasant office practice part-time. Call 547-2686.

VACATION HOME TO RENT

Do you really want to get away from it all? If so, consider this new home on Cedar Island, Va. (about 25 minutes farther from Baltimore than Ocean City). Eight miles of unspoiled beach. No street lights (or streets either, for that matter) no boardwalk, no convenience stores. Total of 20 homes on the island. Great surf casting, unpicked over shells, or just loafing around in a new vacation home with all conveniences (generator, air conditioning, dishwasher, washing machine and dryer). ATTN: Birdwatchers: this is the home of the piping plover, an endangered species. Approachable only by boat; rental of a skiff is included. Rudimentary boating skills required. For photographs and/or videotape, call 410-337-5318.

OFFICE FOR LEASE

Available short- or long-term, part-time/full-time. Fully equipped, suitable for a wide range of specialties. Location: Professional Centre, adjacent to St. Joseph Hospital. Call 410-337-1586.

LABORATORY MACHINE FOR SALE

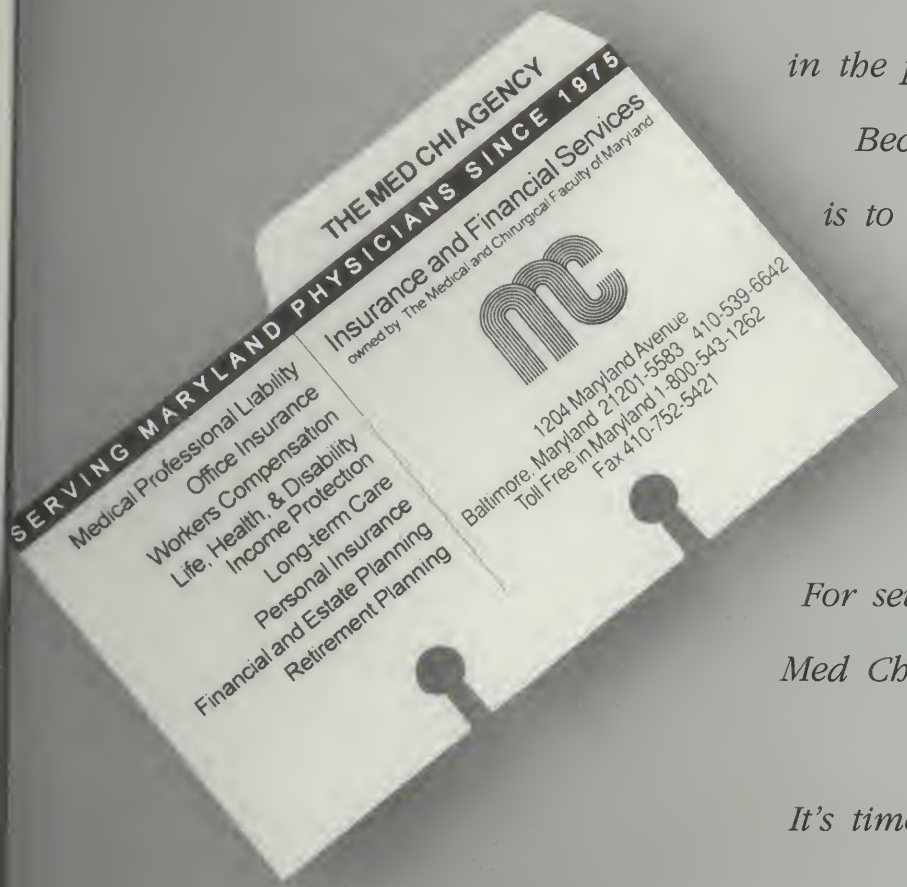
OCCUPATIONAL HEALTH

Baltimore's largest and most comprehensive occupational health care corporation is seeking an ambitious, well-motivated physician with excellent clinical skills in evaluations, treatment of work-related injuries and illnesses and primary care. Board eligible or board certified in a primary care specialty with occupational medicine experience or training desired. Call Beth at 410-752-3010.

MMJ
Classified Advertising



Effective with the 1993 April issue, prepayment is required for all classified advertising.

- Cost for Med Chi members is $5.00 per 35 characters or portion thereof (each letter, number, symbol, punctuation mark, or space counts as one character).
- Cost for nonmembers is $8.00 per 35 characters or portion thereof with a minimum cost of $50.00 per advertisement.
- Advertisements placed for the benefit of an HMO or a hospital are charged the nonmember rate.
- Advertisements for services (e.g., collection agencies) or for items not related to the practice of medicine (e.g., real estate sales) are limited to a maximum of three placements per calendar year.
- Spouses of deceased members shall be entitled to two complimentary insertions for the disposal of the deceased physician's practice or equipment.
- Box numbers are provided free of charge.
- Advertising copy and payment (checks should be made out to *Maryland Medical Journal*) should be sent seven weeks prior to the first of the month in which the advertisement is to appear.

Box replies and advertising copy should be sent to

SOUND PROTECTION

Choosing a professional liability insurer is a major decision–too important to play by ear.

Princeton Insurance Company's high-quality investment portfolio and our conservative approach to loss reserving have made us the choice of 22,000 in the medical and health care community.

We're not just blowing our own horn. Standard & Poor's has awarded us a claims-paying ability rating of "A."

That's sound protection through financial strength and stability.

Princeton. It's worth it!

Straight Talk. Doctor-To-Doctor.

When you're tired of playing games with risk retention groups or insurance companies, we'll be glad to give you the straight talk you need to make your best choices.

Straight talk about coverage options, premium discounts, free retirement coverage, risk management programs, and all the kinds of choices doctors really need.

Where did we learn to talk like this? Simple. We're run by doctors, and doctors are too busy to play games.

To learn more about joining the thousands of your physician colleagues insured by Medical Mutual, call us at 1-800-492-0193.

Doctor-to-doctor. What better way to hear it straight?

YOU DON'T HAVE TO PUT OFF UNTIL TOMORROW WHAT YOUR FAMILY DESERVES TODAY.

RIVER FALLS
Potomac's Family Community.

Right now, the design, the quality and the unique lifestyle of a River Falls home are an all-time best buy. This new generation of Gosnell-built homes are designed with every amenity and offer floor plans that make living easy plus offer the opportunity to customize to your family's lifestyle.

Today, a River Falls home is still an eminently affordable investment and a smart one too. Three, four and even five bedroom homes start in the $600's with absolutely no compromise in quality. There's still terrific financing, with the best terms in years. But to take advantage of this opportunity, you must act now.

The rewards of a River Falls home go beyond the dollars and cents. You've also made a great investment for your family. River Falls is a way of life where raising a family with old-fashioned values is still important. A neighborhood that you can depend on to support the growth and development of your children. Active community involvement and community-owned olympic-sized pool, tennis courts, clubhouse, and playing field assures a wide range of family programs.

Why River Falls is today's best buy.

- Well-established local builder since 1925
- Custom designs without the custom price
- Homes designed for family living
- Neighborhood with old-fashioned values
- Community-owned amenities
- Highly regarded public and private schools

Where else can you get such a sound investment with such outstanding returns? Come see it now.

Take beltway Great Falls Exit 41 onto G.W. Pkwy. (Clara Barton) west to left at MacArthur Blvd. Go 2/10 m. to right at Brickyard Rd. Follow to model home on corner at 10400 Stable Lane.

HOURS: 12-5 daily. *PHONE: 301-299-3700.*
Brokers welcome.

NEW

INTRODUCING
MARYLAND'S ONLY LOW-RISK TAX-FREE BOND FUND

THE T. ROWE PRICE MARYLAND SHORT-TERM TAX-FREE BOND FUND

T. Rowe Price, manager of the largest municipal bond fund in the state, introduces the first no-load mutual fund to combine the tax advantages of Maryland municipal securities with the reduced volatility of short-term bonds. Designed for Maryland investors who want a conservative investment, the Fund offers higher yields than money funds, with less risk than long-term bond funds. And its income is exempt from federal, state, and local taxes—which is important here in Maryland, since you could be losing over one-third of your earnings to taxes.

Your earnings are higher with tax-frees*

Annual income on an investment of $20,000 if you're in the 31% federal tax bracket, or 37.2% bracket including state and local taxes

	What you earn	What you pay in federal taxes	What you pay in state and local taxes	What you keep
Taxable fund yielding 5.0%	$1,000	— $310	— $62	= $628
Tax-free fund yielding 3.5%	$700	— $0	— $0	= $700

While earnings from typical taxable investments initially appear to be higher, taxes can subtract a lot. With triple-tax-frees, you keep it all.

The significant yield advantage of triple-tax-free investing

Yields on tax-free funds are currently attractive versus those on comparable taxable funds. The chart shows that you could earn higher after-tax income investing in a triple-tax-free fund.

The lower risk of short-term securities

Our new Fund invests in short-term securities issued in Maryland, and has an average portfolio maturity of 1–3 years. Longer-term bond funds can generate higher income, but have greater risk. This Fund's short-term securities should be less sensitive to interest rate changes, making it appropriate for those who prefer a more cautious investment approach. Of course, this is a bond fund, so yield and share price will vary.

Baltimore City Health Department: 200 Years of Partnership and Progress
September 1-2, 1993
200th Anniversary Celebration Conference
Baltimore Convention Center

This 200th Anniversary conference is designed to celebrate the creation of the first legally mandated public health department in the continental United States. The Baltimore City Health Department is hosting this two day colloquium to recognize the pioneering efforts of private and public health care professionals who established innovative programs. During this two day presentation, programs designed to meet current public health problems and to consider proposed solutions will be discussed. Each of the planned presentations will emphasize the need for health promotion and disease prevention for all citizens. Principal areas to be stressed are: Child Health, Dental Health, Family Health, Environmental Health, Geriatric Health, Nursing, Preventive Medicine and Epidemiology, Psychological Health, and Women's Health Care.

C.M.E. and C.E.U. credits will be provided.

Distinguished speakers have been selected from universities, hospitals, private and public health care organizations as well as private sector businesses throughout the United States.

Co-Sponsors:

Baltimore City Medical Society
Baltimore College of Dental Surgery, Dental School, University of Maryland at Baltimore
Bon Secours Hospital
Francis Scott Key Medical Center
Good Samaritan Hospital
Johns Hopkins Hospital
Johns Hopkins University, School of Medicine
Johns Hopkins University, School of Hygiene and Public Health

June 1993

Donald "Ted" Lewers, M.D., Elected to AMA Board of Trustees

Donald "Ted" Lewers, M.D., a nephrologist and internist from Easton, Maryland, was elected to the American Medical Association (AMA) Board of Trustees on June 16, 1993. Dr. Lewers is the first Maryland physician to be elected to this board. He is a past Med Chi president and has been a member of the AMA House of Delegates since 1984.

President of the Kanagawa Prefectural Medical Association Visits AMA Annual Meeting

During the recent AMA 1993 annual meeting in Chicago, the Maryland Delegation to the AMA was pleased to welcome and introduce Ryohei Kawaguchi, M.D., president of the Kanagawa Prefectural Medical Association. Dr. Kawaguchi attended several meetings in Chicago and was introduced during the opening of the AMA House of Delegates. Hiroshi Nakazawa, M.D., Med Chi Public Relations Committee chairperson, was instrumental in coordinating the visit by the president of Med Chi's sister state medical association.

Reimbursement of Legal Fees

Medical Mutual Liability Insurance Society of Maryland offers a coverage (Med Guard) to its policyholders that pays for legal fees to defend a physician in disciplinary proceedings involving

- Hospital, HMO/PPO peer review
- Local and state society peer review
- State licensure and disciplinary boards
- National Practitioner Data Bank
- PROs (professional review organizations)
- OBRA (Omnibus Budget Reconciliation Act)

Med Guard can be obtained for the individual physician or purchased by a professional organization to provide coverage for each employed physician, certified registered nurse anesthetist (CRNA), or physician assistant. Rates are governed by the limit of defense coverage selected on an individual basis or professional organization classification and generally range from $600 to $800 annually.

For more information regarding Med Guard coverage with Medical Mutual Liability Insurance Society of Maryland, you may contact the company directly or the Med Chi Agency at 410-539-6642 or 800-543-1262.

Medicare Co-Payments/ Deductibles

The amount that must be paid before Medicare will pay for any items or services for an individual is the Medicare deductible. The co-payment or coinsurance is the portion of the cost of an item or service that the Medicare beneficiary has the responsibility to pay. Routine waiver of co-payments or deductibles misrepresents the actual charge made, is unlawful, and a provider or supplier could be held liable for submitting a false claim or for violating the Medicare anti-kickback statute.

An exception to this prohibition against waiving co-payments and deductibles is when there is special consideration because of a particular patient's hardship. In this type of situation, documentation should show a good faith effort to collect the money and the reason why the payment had to be waived.

AMA, FBI Targeting Health Care Fraud

The AMA and FBI (Federal Bureau of Investigation) are working together to uncover health care fraud, and the AMA has established a fraud hotline (1-800-262-3211) that physicians or health care workers can call to report incidents of fraud. Information obtained from the hotline reports are passed on to the FBI.

HCFA Consultation Policy Reversed

Effective for dates of service June 28, 1993, and after, Medicare will no longer deny consultations billed by a provider who has seen the patient within the previous three years.

Physicians who perform pre-operative consultation for an established patient at the request of a surgeon may bill the appropriate consultation code using the current CPT (current procedural terminology) definition of consultation.

Thank you to the physicians who supported AMA and Med Chi efforts to change Health Care Financing Administration (HCFA) policy concerning nonpayment for consultations to established patients.

Medicare Clarification—Locum Tenens Situations

For the remainder of 1993, the patient's regular physician may continue to bill for services provided by a substitute physician if

- the substitute physician is paid by the regular physician on a per diem or fee-for-time basis;
- the period of locum tenens coverage does not exceed 60 consecutive days;
- the procedure codes for services by the substitute physician are modified with Q6; and
- a record is kept of the services performed by a substitute physician and is associated with the substitute physician's universal physician identification number (UPIN). (The UPIN does not have to be put on the claim form at this time.)

Medicare Fraud Alerts

The first two Medicare Fraud Alerts prepared by Medicare contractor fraud and abuse personnel and investigators from the Office of the Inspector General follow this newsletter. These alerts are being provided to inform health care providers of Medicare schemes and issues suggestive of fraud and abuse. Please review the alerts and detach for your records those alerts that pertain to your practice.

Universal Precautions Sign

According to Maryland law (*Maryland Health Occupations Code Annotated* §14-415), if a physician is engaged in the private practice of medicine, the physician shall conspicuously display a universal precautions sign in the office where the physician is engaged in practice.

The sign, which **must** immediately be displayed in all physician offices, follows this CEO's newsletter. Please place it in a conspicuous place where patients can see and read it.

1993 Med Chi Semiannual Meeting

Get in the swim and come to the Med Chi semiannual meeting being held Friday, September 10, 1993, through Sunday, September 12, 1993, at the Sheraton Ocean City Resort and Conference Center.

Med Chi has reserved a block of rooms at a special group rate of $110.00 per night for a single/double occupany room (tax and incidentals not included). To reserve a room, call the Sheraton at 1-800-638-2100 and tell them you will be attending the Med Chi meeting. Bring the family and enjoy the water! Registration form and tentative agenda follow this newsletter.

President's Regional Conferences

Med Chi has set dates for two president's regional conferences this fall:

- Eastern Shore — Tuesday, October 19, 1993, at the Cambridge Yacht Club in Cambridge, Maryland
- Western Maryland — Thursday, November 11, 1993, at the Sheraton in Hagerstown, Maryland

Med Chi is currently surveying area physicians to determine subjects of local concern and topics for a continuing medical education presentation at the meetings. Physicians are strongly encouraged to complete these needs assessments and attend their regional meeting. For questions regarding the president's regional conferences, contact Joan Mannion at 410-539-0872 or 1-800-492-1056.

Advance Directives

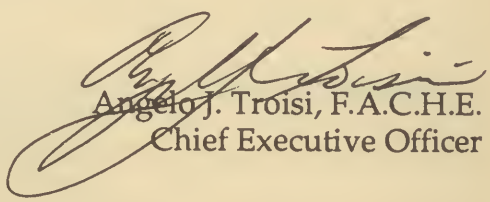
The Patient Self-Determination Act, a federal law that applies to hospitals, nursing homes, home health care agencies, and hospices certified by Medicare or Medicaid, requires that adult patients be advised of their right to accept or refuse medical care and their right to execute an advance directive. In addition, managed care organizations must provide this information to new adult enrollees.

Two brochures, a physician brochure and a patient brochure, have been developed by the AMA to help both groups understand advance directives. To order these brochures, call the AMA Customer Service toll-free number, 1-800-621-8335.

Baltimore City Medical Society Awards Scholarships

The Baltimore City Medical Society Foundation awarded $15,750 in scholarships to five Baltimore City medical school students and one student from Baltimore County. The scholarships were supported by contributions from individual physician members of the Baltimore City Medical Society (BCMS) and their friends and families, the BCMS Auxiliary, and the medical staffs of Bon Secours, Liberty, and Sinai hospitals. The primary goal of the program is to support city medical school students and encourage them to return to Baltimore to practice medicine.

Journals Needed



Volume 27 of the *Maryland State Medical Journal* is missing from the Med Chi library. If you have journal copies from 1978 that you would be willing to donate to the library, please call Margaret Burri at 410-539-0872 or 1-800-492-1056.

Physicians Needed for Radio Program

Consultation, a weekly radio program sponsored by Med Chi, allows physicians to appear on WBAL-AM radio to discuss the latest developments in medicine and to answer questions about current health issues. Med Chi currently airs the one-on-one talk show, with host John Stupak, on Sunday mornings at 9:30 a.m. Interested physicians should contact Lori Robinson at 410-539-0872 or 1-800-492-1056.

Calling All Medical Musicians

VA-National Medical Musical Group (VA-NMMG) is recruiting new members for its chorus and symphony orchestra. If you are a good singer or play a musical instrument well, and you are a physician, nurse, student, or other medical professional, you may apply. The VA-NMMG program is slated to perform on November 10, 1993, at DAR Constitution Hall in Washington, DC. The group will then conduct a concert tour of England and Wales, November 11–19. For information on auditions or travel to Great Britain (nonperformers may travel as companions), call Mrs. Nevart Haley at 202-667-3879.

Angelo J. Troisi, F.A.C.H.E.
Chief Executive Officer

MEDICARE FRAUD ALERT

BLUE CROSS BLUE SHIELD OF MARYLAND, MEDICARE DIVISION

FRAUD ALERT # 1993-N1
MAY 12, 1993

FALSE CLAIMS FOR LABORATORY SERVICES

A large, interstate, clinical laboratory recently entered into a settlement with a U.S. Attorney to repay more than $110 million to the Medicare and Medicaid programs for submitting false claims and pleaded guilty to criminal charges. The scheme resulted in physicians ordering medically unnecessary services, and involved Sequential Multi-Analysis Computer (SMAC) tests, (CPT codes 80002 - 80019), HDL-cholesterol tests (CPT codes 83718), LDL tests, (CPT code 83710), Lipid profile (CPT code 80061), total cholesterol tests (CPT code 82465), and serum ferritin tests (CPT code 82728).

The scheme was as follows. When a physician ordered a SMAC, the laboratory would also perform, and bill the physician a nominal amount for, the HDL-cholesterol test. If the physician objected, the additional charge would be dropped. New physician clients were told the test was free. The laboratory did not inform the physicians that it was billing insurers, such as Medicare, for the test ($18 for SMAC, $16 for HDL-cholesterol). The laboratory subsequently revised its pre-printed test ordering form, changing the item, SMAC, to Health Survey Profile. Health Survey Profile consisted of both SMAC and the HDL-cholesterol test. Thus, whether the HDL-cholesterol test was medically necessary or not, the physician was induced to order it.

Subsequently, the laboratory added the serum ferritin test to its Health Survey Profile (at an additional charge to insurers of $16). Again there was a nominal additional charge to physician clients that was waived if the physician objected.

In 1986, Medicare paid the laboratory about $500,000 exclusively for the serum ferritin test. By 1990, medicare was paying the laboratory $31 million exclusively for the ferritin test.

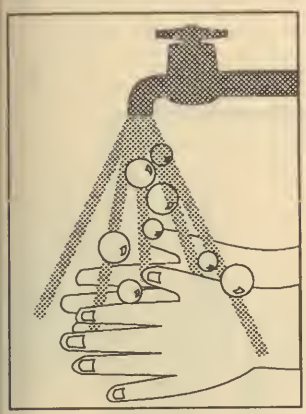
MEDICARE FRAUD ALERT

BLUE CROSS BLUE SHIELD OF MARYLAND, MEDICARE DIVISION

FRAUD ALERT # 1993-N2
MAY 12, 1993

FALSE CLAIMS FOR LUMISCOPES



The Medicare Contractor for California reports having received claims for "lumiscopes" billed as "a heat lamp, without stand (table model), includes bulb, or infra red element." The determination has been made that this product which contains a 7.5 watt bulb does not meet the definition of Durable Medical Equipment (DME) for purpose of Medicare coverage and will not be reimbursed. Misrepresenting lumiscopes as infra red heat lamps on Medicare claims may constitute program fraud.

For further information call Don Nicholson at (410) 561-7976.

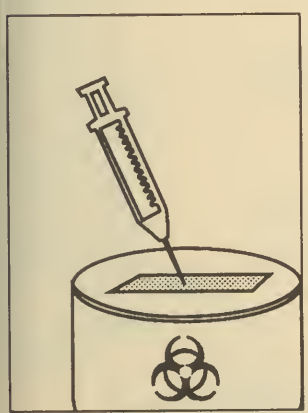
We Take Precautions for You



Because you, our patients, are important to us, we are taking special steps to protect you and your health. These steps include:

Washing our hands
before and after
patient care

Putting on gloves
when contact with blood
and/or bloody fluids
is likely to occur

Disposing of used needles and sharp objects
by placing them
in a puncture proof
container

Putting on a mask, eye protection, and a gown
if splash or splatter
of blood or bloody
fluids is likely to occur

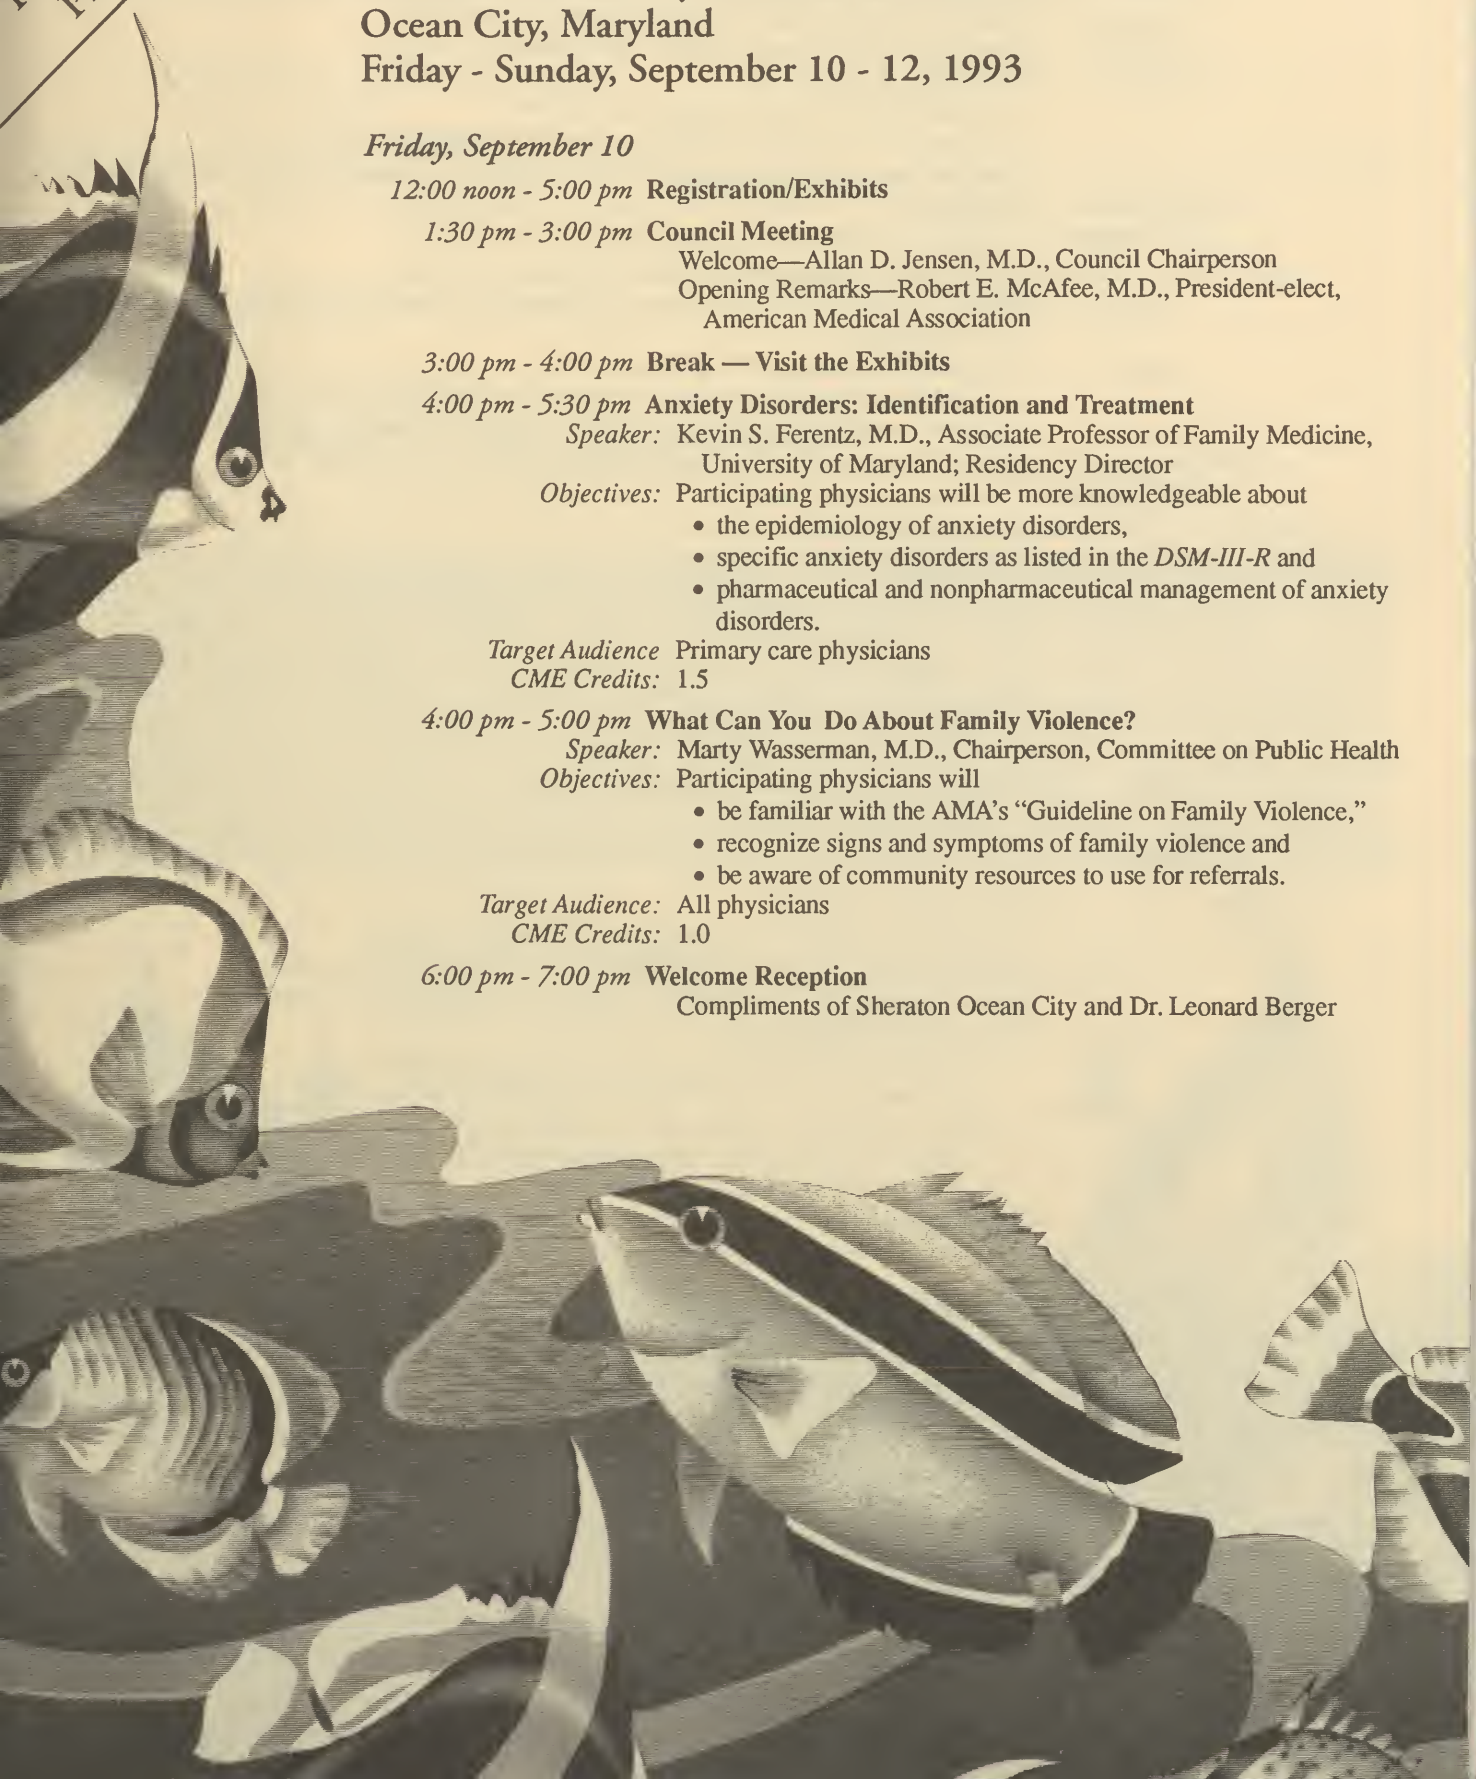
Cleaning our surroundings and equipment
by using disinfectants

If you don't think all of these precautions are being taken, talk with your health care provider, or you may contact the State Board of Physician Quality Assurance at 410-764-4777.

DHMH 4472 (1-93)

Universal Precautions Sign

According to Maryland law (*Maryland Health Occupations Code Annotated* §14-415), if a physician is engaged in the private practice of medicine, the physician shall conspicuously display a universal precautions sign in the office where the physician is engaged in practice.



The sign must immediately be displayed in all physician offices. Please place it in a conspicuous place where patients can see and read it.

The sign on the reverse side of the page is provided to you courtesy of the Medical and Chirurgical Faculty of Maryland, 410-539-0872.

PRELIMINARY PROGRAM

1993 Semiannual Meeting of the Medical and Chirurgical Faculty of Maryland

at the Sheraton Ocean City Resort and Conference Center
Ocean City, Maryland
Friday - Sunday, September 10 - 12, 1993

Friday, September 10

12:00 noon - 5:00 pm **Registration/Exhibits**

1:30 pm - 3:00 pm **Council Meeting**
Welcome—Allan D. Jensen, M.D., Council Chairperson
Opening Remarks—Robert E. McAfee, M.D., President-elect, American Medical Association

3:00 pm - 4:00 pm **Break — Visit the Exhibits**

4:00 pm - 5:30 pm **Anxiety Disorders: Identification and Treatment**
Speaker: Kevin S. Ferentz, M.D., Associate Professor of Family Medicine, University of Maryland; Residency Director
Objectives: Participating physicians will be more knowledgeable about
- the epidemiology of anxiety disorders,
- specific anxiety disorders as listed in the *DSM-III-R* and
- pharmaceutical and nonpharmaceutical management of anxiety disorders.

Target Audience Primary care physicians
CME Credits: 1.5

4:00 pm - 5:00 pm **What Can You Do About Family Violence?**
Speaker: Marty Wasserman, M.D., Chairperson, Committee on Public Health
Objectives: Participating physicians will
- be familiar with the AMA's "Guideline on Family Violence,"
- recognize signs and symptoms of family violence and
- be aware of community resources to use for referrals.

Target Audience: All physicians
CME Credits: 1.0

6:00 pm - 7:00 pm **Welcome Reception**
Compliments of Sheraton Ocean City and Dr. Leonard Berger

Saturday, September 11

7:15 am - 5:00 pm **Registration /Exhibits**

7:30 am - 9:30 am **Medicine on Trial: An Interactive Risk Management Program for Physicians**

Medical Mutual Liability Insurance Society of Maryland (Med Mutual will give a 5% premium discount on 1994 individual liability renewal policies to its members who attend this program. To receive the premium discount, there is a $40 program fee.)

Speakers: Thomas G. Chiccone, M.D., Capital Emergency Associates
Beth Petree, Claims Representative, Med Mutual

Objectives: Participating physicians will

- be able to identify pertinent patient care issues,
- increase their knowledge of diagnostic and therapeutic modalities,
- understand a medical malpractice claim and become more aware of risk management skills.

Target Audience: All physicians
CME Credits: 2.0

8:00 am - 9:30 am **Step-by-Step: Documenting Your CME Program**

Speakers: William L. Thomas, M.D., Chairperson, Committee on Continuing Medical Education Review and invited panel

Objectives: Participating physicians will better understand

- what documentation is necessary to demonstrate compliance with the seven "Essentials" and
- how to document compliance with the "Standards for Commercial Support of CME."

Target Audience: All physicians involved with the planning of continuing medical education
CME Credits: 1.5

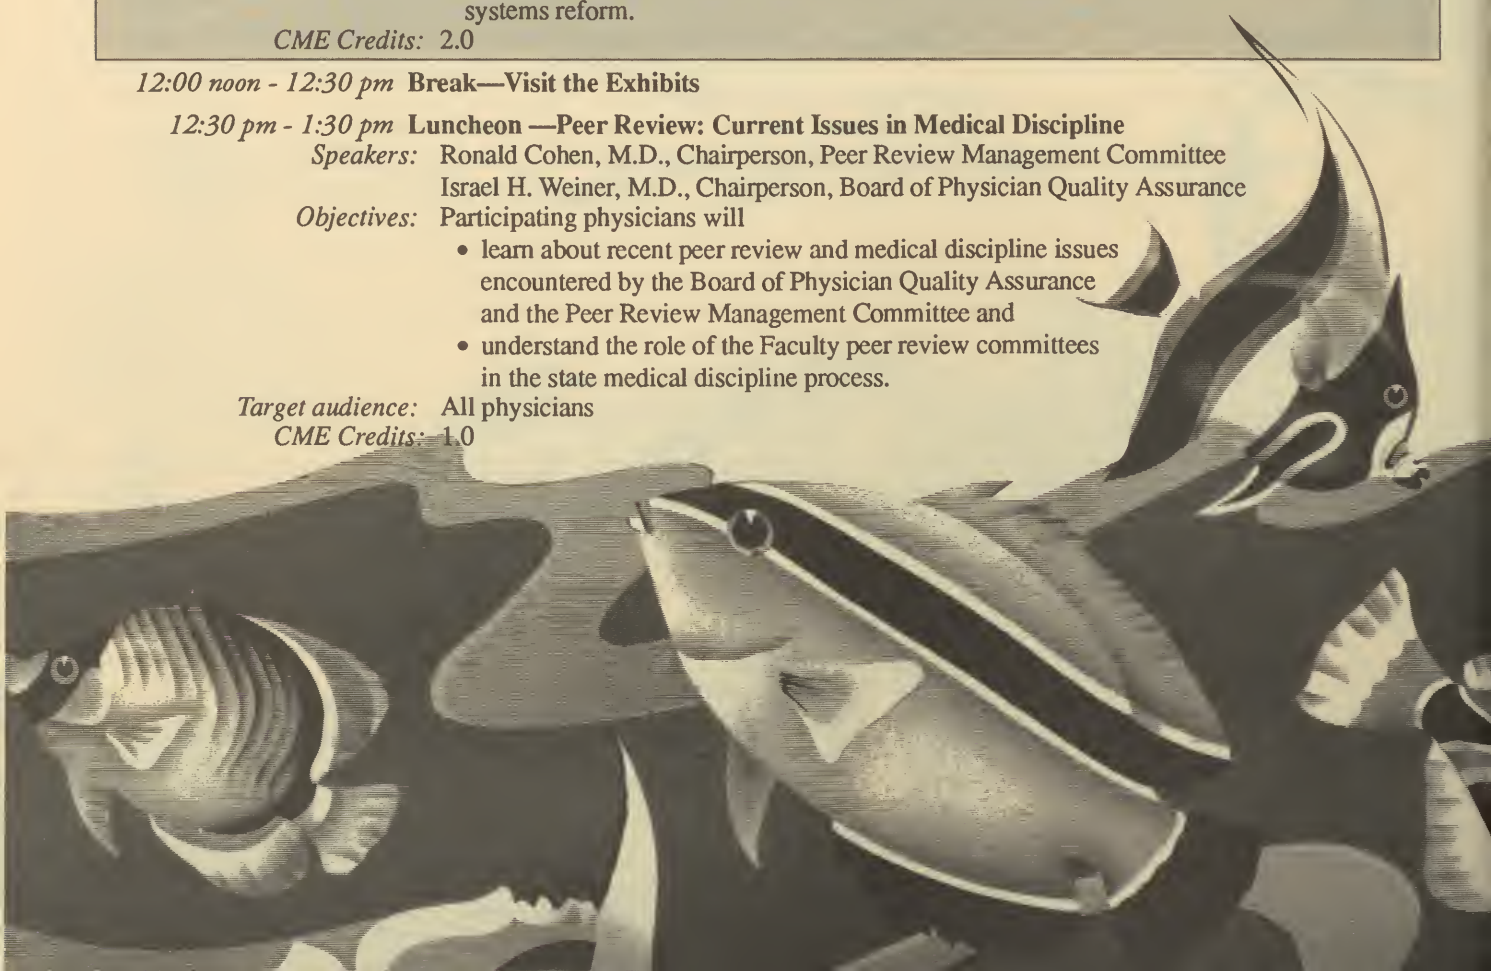
9:30 am - 10:00 am **Break—Visit the Exhibits**

10:00 am - 12:00 noon **Plenary Session—Health Systems Reform: The Effect on Patient Care**

Speakers: Robert E. McAfee, M.D., President-elect, American Medical Association
Robert Pulliam, M.D., President, West Virginia Medical Society
The Honorable Casper R. Taylor, Jr., Chairperson, House Economic Matters Committee, Maryland House of Delegates
The Honorable Gary R. Alexander, Vice Chairperson, House Economic Matters Committee, Maryland House of Delegates

Objective: Participating physicians will be informed about the most recent developments in health systems reform.
CME Credits: 2.0

12:00 noon - 12:30 pm **Break—Visit the Exhibits**



12:30 pm - 1:30 pm **Luncheon —Peer Review: Current Issues in Medical Discipline**

Speakers: Ronald Cohen, M.D., Chairperson, Peer Review Management Committee
Israel H. Weiner, M.D., Chairperson, Board of Physician Quality Assurance

Objectives: Participating physicians will

- learn about recent peer review and medical discipline issues encountered by the Board of Physician Quality Assurance and the Peer Review Management Committee and
- understand the role of the Faculty peer review committees in the state medical discipline process.

Target audience: All physicians
CME Credits: 1.0

1:30 pm - 3:30 pm **House of Delegates Meeting**
Introductory Remarks—Joseph Snyder, M.D., President, Med Chi

3:30 pm - 4:30 pm **Break—Visit the Exhibits**

4:30 pm - 6:00 pm **It's Just Arthritis — Take Some Aspirin**
Speaker: Ira T. Fine, M.D., Chief, Division of Rheumatology, Sinai Hospital
Objectives: Participating physicians will be aware of
- the different types of arthritis,
- appropriate diagnostic approaches and appropriate therapeutic interventions.

Target Audience: Primary care physicians
CME Credits: 1.5

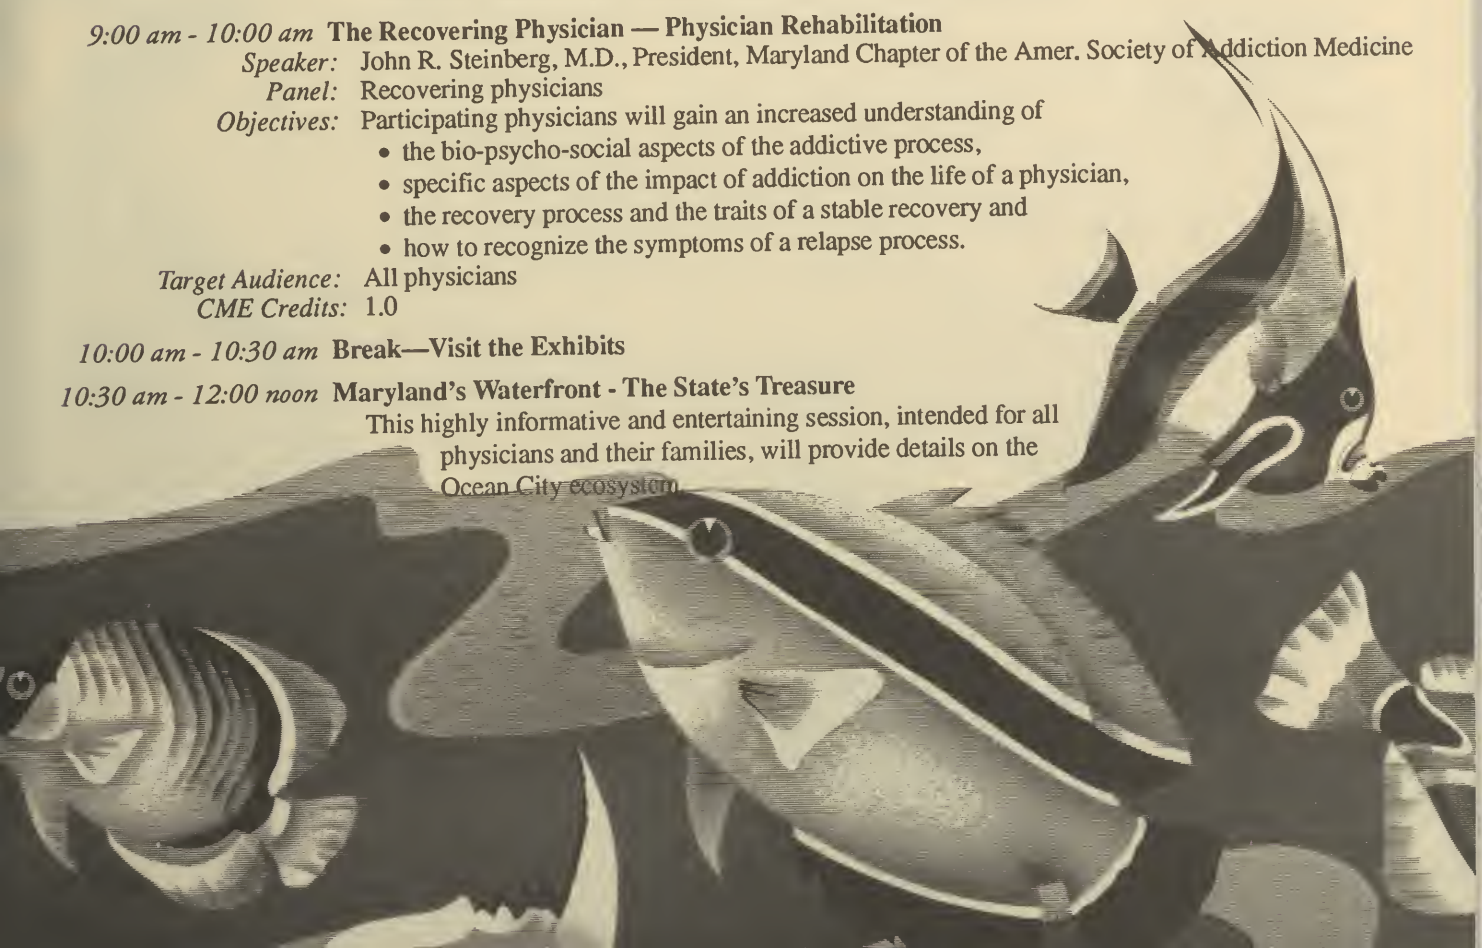
4:30 pm - 6:00 pm **Early Detection of Prostate Cancer**
Speaker: Stephen C. Jacobs, M.D., Professor of the Dept. of Urology, Univ. of Maryland School of Medicine
Objectives: Participating physicians will have a greater understanding of
- when to recommend the use of prostate-specific-antigen,
- guidelines for treating prostate disease and when to refer to a urologist.

Target Audience: Primary care physicians
CME Credits: 1.5

Sunday, September 12

7:30 am - 12:00 noon **Registration /Exhibits**

8:00 am - 9:00 am **Med Chi Insurance Agency Breakfast Seminar**
The Age Favored Retirement Plan: A New Concept for Qualified Retirement Planning
Speaker: Michael H. Korthaus, Pension Specialist, Safeco Life Insurance Company
Objectives: Discussion of qualifed retirement plans and the advantages of a new flexible concept that has become the answer for many professional practices where the owners and executives tend to be older and more highly compensated.
Target Audience: All physicians and spouses (LIMITED TO 50—PREREGISTRATION REQUIRED)



9:00 am - 10:00 am **Medicine in Maryland: The Practice and the Profession**
Speaker: Jane Elliott Sewell, Ph.D., History of Medicine Scholar
Dr. Sewell will discuss the diversity of practices, the evolution of medical education and governing institutions, medical milestones in Maryland and the way changing social, economic and cultural settings interacted with the medical arena.

9:00 am - 10:00 am **The Recovering Physician — Physician Rehabilitation**
Speaker: John R. Steinberg, M.D., President, Maryland Chapter of the Amer. Society of Addiction Medicine
Panel: Recovering physicians
Objectives: Participating physicians will gain an increased understanding of
- the bio-psycho-social aspects of the addictive process,
- specific aspects of the impact of addiction on the life of a physician,
- the recovery process and the traits of a stable recovery and
- how to recognize the symptoms of a relapse process.

Target Audience: All physicians
CME Credits: 1.0

10:00 am - 10:30 am **Break—Visit the Exhibits**

10:30 am - 12:00 noon **Maryland's Waterfront - The State's Treasure**
This highly informative and entertaining session, intended for all physicians and their families, will provide details on the Ocean City ecosystem.

Hotel Information

The Sheraton Ocean City Resort and Conference Center is located at 10100 Ocean Highway, Ocean City, Maryland.

Guest check-in time is 3:00 pm. Check-out time is 11:00 am. Requests for early check-ins and late check-outs will be honored on a space available basis only.

Reservations

Med Chi has reserved a block of rooms at a special group rate. To reserve your room, call 1-800-638-2100 and tell them you'll be attending the Med Chi Semiannual Meeting. To receive the Med Chi group rate, your reservations must be made by **August 24, 1993**.

Continuing Medical Education Credit

The Medical and Chirurgical Faculty of Maryland designates this continuing medical education activity for up to 13 hours in Category 1 of the Physician's Recognition Award of the American Medical Association. Physicians attending this year's meeting can earn up to a maximum of 9 CME credits.

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

Registration Form
Medical and Chirurgical Faculty of Maryland
1993 Semiannual Meeting
Friday - Sunday, September 10 - 12, 1993
Sheraton Ocean City Resort and Conference Center

Check one: ☐ Med Chi member - no charge ☐ Nonmember - $35.00

Preregister: ☐ Med Chi Insurance Agency Breakfast (Sunday, 8:00 - 9:00 am)

Form of payment: ☐ Check (payable to Med Chi)
☐ MasterCard ☐ Visa

Credit Card No. _____ Exp. Date _____

Signature _____

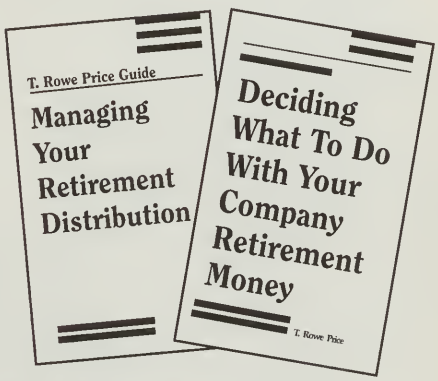
Component Medical Society (County) _____

Physicians are encouraged to send this registration form by August 31, 1993.
Med Chi Conventions, 1211 Cathedral St., Baltimore, MD 21201 or fax this form to 410-547-0915 For additional information, call 410-539-0872 (Baltimore area) or 1-800-492-1056 (elsewhere in Maryland).



NEW ROLLOVER LAW FOR 1993

LEAVING YOUR JOB?
DON'T LEAVE 20% OF YOUR RETIREMENT MONEY BEHIND

FREE T. ROWE PRICE KIT HELPS YOU PROTECT YOUR RETIREMENT SAVINGS

If you're leaving your job, choosing what to do with your retirement plan payout may be one of the most important decisions you'll make. And a new law makes your choices more complicated—and more important—than ever. *Depending on your decision, the IRS could withhold 20% of your retirement money.*

We help you know *all* your options. Your retirement distribution could be a primary source of income in retirement. To help manage this money, request our free, up-to-date kit, *Managing Your Retirement Distribution*. It can help you understand **all** your options. In plain, straightforward language, we give you the information you need to decide what's best for you.

HOW THE NEW LAW AFFECTS YOU

As of January 1, 1993, you may *directly* roll over most qualified plan payouts from your previous plan to an IRA or new employer plan.

If you do not have the money directly rolled over, 20% of the total will automatically be withheld from your distribution.

If you receive the payout, you may still do a rollover, but you will have to make up the 20% out of your own pocket. Otherwise, the amount withheld will be subject to income taxes and, possibly, a penalty.

The T. Rowe Price advantage. If you decide to move your distribution to a T. Rowe Price IRA, we can help you invest it to meet your retirement goals. You'll have access to our complete family of mutual funds—**all 100% sales-commission-free**—which probably offers more investment choices than you had in your employer-sponsored plan. And our discount brokerage service lets you roll over securities you may receive as part of your distribution.

Our free *Direct Rollover Service* makes it easy. Simply fill out the application enclosed with your free kit to open your IRA. With our *Direct Rollover Service*, we will coordinate your request directly with your previous employer if you so choose.

Call 24 hours for more information and a free kit

Request a prospectus with more complete information, including management fees and other charges and expenses. Read it carefully before you invest or send money. T. Rowe Price Investment Services, Inc., Distributor, 100 E. Pratt Street, Baltimore, MD 21202.

WHEN YOU'RE TOPS IN YOUR FIELD, YOU DON'T HAVE TIME TO STOP AND HAVE YOUR PICTURE TAKEN.

Nationally recognized physicians–and the highly trained staff that supports them–are everywhere at The George Washington University Medical Center. Some are busy working in our cancer, neurological, emergency medicine, cardiovascular, or any of our other specialty areas. The rest can be found at our research and teaching facilities. But no matter where they are, each one brings a highly specialized skill to our interdisciplinary approach that combines the best possible human and technical resources available. The only place you won't find our staff is posing for pictures. Rest assured, their experience is worth a thousand words.

Our Pictures Are Worth A Thousand Words.

Case #24

Baseline mammogram in a 56 year old asymptomatic woman.

DIAGNOSIS: Invasive Ductal Carcinoma.

Over 180,000 women in the United States will develop breast cancer in 1993. Mammography is still the best way to detect small breast cancers that result in decreased mortality and can be treated with breast conservation therapy. However, mammography may be non-specific and with the increased utilization of screening, numerous non-palpable, indeterminate lesions are detected. Until recently, the only way to determine whether these lesions were benign or malignant was with needle-guided open surgical biopsy.

Stereotactic breast biopsies are now performed in an outpatient setting in our Pomona office. This device uses a computer to calculate the exact 3D position of a non-palpable lesion and directs a needle into the abnormality for tissue sampling.

Figure 1 (craniocaudal view) shows a 1 cm. spiculated mass in the right inner breast (arrow). Local anesthesia is administered directly over the area to be biopsied. A small skin puncture is made and a 14-gauge needle attached to an automated biopsy gun is placed directly into the abnormality under computer guidance. Figure 2 demonstrates the pre-biopsy position of the needle with respect to the lesion. The post-biopsy film (Figure 3) shows the needle through the mass confirming the lesion was sampled.

Stereotactic biopsy has achieved the same sensitivity (95%) as open surgical biopsy. The advantages of stereotactic breast biopsy include improved cosmesis and decreased morbidity. The patient is able to resume routine activities the same day. In addition, the cost of stereotactic biopsy is less than half that of open surgical biopsy. With the emphasis on medical cost containment, this procedure could dramatically reduce open biopsies of benign breast lesions and two-stage surgical procedures for treatment of breast cancer.

Diabetic retinopathy: A review

Margaret Liv Blom, M.D.; W. Richard Green, M.D.; and Andrew P. Schachat, M.D.

From the Johns Hopkins Medical Institutions, Baltimore, Maryland, where Dr. Blom is an ophthalmologist at the Wilmer Institute; Dr. Green is a professor of ophthalmology, Eye Pathology Laboratory, and associate professor of pathology, Department of Pathology; and Dr. Schachat is chief, Retinal Vascular Service.

ABSTRACT: *In the United States, diabetic retinopathy is the leading cause of new blindness in those of occupational age. We present an overview of risk factors, including renal disease, uncontrolled blood pressure, pregnancy, poor glucose control, elevated glycosylated hemoglobin, duration of disease, and age at time of diagnosis; pathogenesis, addressing the involvement of aldose reductase, nonenzymatic glycosylation of proteins, vasoproliferative factors, ischemia and vasodilation, systemic growth factors, and platelets and blood viscosity; pathology, including nonproliferative, preproliferative, and proliferative retinopathy; and the management of this condition.*

Diabetes mellitus affects 5% of the world population and is the second leading cause of legal blindness in adults in industrialized countries.[1] Estimates from the Centers for Disease Control and Prevention indicate there are 50,000 people with blindness due to diabetes in the United States, with 5,800 new cases developing per year.[2]

Diabetes mellitus is due to a relative or absolute insulin deficiency that results in glucose excess. This glucose excess affects large and small blood vessels over time resulting in atherosclerosis and hyalinization of arterial walls. With time, secondary changes due to this process occur predominantly in the kidneys, peripheral nerves, pancreas, and eyes, resulting in a life expectancy reduction for men and women of at least 9.1 and 6.7 years, respectively.[3,4]

One ocular manifestation of diabetes mellitus is diabetic retinopathy, which occurs in 1.5%–2% of all diabetic individuals.[5] In the United States, diabetic retinopathy is the leading cause of new blindness, particularly among people of occupational age.[6,7] More importantly, mortality rates are significantly elevated in patients with diabetic retinopathy.[4] Diabetic retinopathy is best described as a capillary microangiopathy involving loss of pericytes

and endothelial cells with changes in the basement membrane thickness. This results in microinfarctions, exudates, retinal edema, and neovascularization. These changes can proceed to vitreous hemorrhage, traction, and retinal detachment causing severe loss of vision.[8]

We present an overview of diabetic retinopathy focusing on risk factors, pathogenesis, pathology, and management—emphasizing the value of screening to detect early, treatable disease.

Risk factors

Renal disease, uncontrolled high blood pressure, pregnancy, poor glucose control, and elevated glycosylated hemoglobin predispose a patient to diabetic retinopathy. Health-related behavior, such as tobacco use, alcohol consumption, and aspirin intake,[9] as well as gender,[4] are more controversial risk factors. Duration of disease and age at time of diagnosis are also important prognostic factors.[6] Race may also turn out to be an important prognostic factor. In a recent study by Hanis and others, it was discovered that Hispanics in general, and Mexican-Americans in particular, are affected with noninsulin-dependent diabetic mellitus (NIDDM) several fold more frequently than the general population.[4]

Renal disease. Renal disease, with its manifestation of proteinuria, and elevated blood urea nitrogen and creatinine serum levels, is an excellent predictor of diabetic retinopathy. A study by Jerneld and Algvere[10] of 365 patients with diabetes, found that 66 (18%) had proteinuria. Of these 66 patients, 39 (59%) had diabetic retinopathy. Proteinuria and serum creatinine correlated with increasing severity of retinopathy. Of 47 patients with proliferative diabetic retinopathy (PDR), 19 (40%) had proteinuria. Of 124 patients with retinopathy of other grades of severity, 20 (16%) had proteinuria. Visual acuity in the best eye was negatively correlated with proteinuria, which was present in 17 of 203 (8.4%) patients with a visual acuity of 20/20, compared with 8 of 15 (53%) with a visual acuity of 20/200 or less.

Uncontrolled high blood pressure. Volhard's statement, *"Ich habe noch keine retinitis diabetica gesehen bei der es sich nicht um eine hypertonie gehandelt hat,"* roughly translated as, "I have never seen a patient with diabetic retinopathy that was not hypertensive," has received much attention and criticism over the past years.[6,11] Subsequent studies have shown that although there is good correlation between the presence of hypertension and diabetic retinopathy in patients with nephropathy, blood pressure in patients without nephropathy does not seem to be as strong a risk factor as previously thought.[6,12]

Pregnancy. Recent studies of retinopathy during pregnancy have demonstrated that some deterioration is common, but, in many cases, postpartum improvement occurs. Approximately 10% of pregnant diabetic women without prior retinopathy develop background diabetic retinopathy, and about 4% of pregnant women with background diabetic retinopathy develop PDR.[6] In patients with treated PDR, no worsening occurred during pregnancy in the study done by Singerman and coworkers in 1980.[13]

It has been concluded that changing retinopathy during pregnancy cannot be interpreted without the assessment of concurrent changes in the regulation of maternal diabetes, and that the abrupt institution of improved diabetic control during pregnancy may be one factor in the deterioration of background retinopathy seen during pregnancy.[6]

Poor glucose control. A large amount of evidence supports the claim that hyperglycemia causes microvascular changes that result in diabetic retinopathy. In one study, laboratory dogs with induced hyperglycemia were divided into three groups. Dogs in the first group had their glucose levels strictly controlled for 5 years. The dogs in the second group had their glucose levels poorly controlled for 2.5 years, with subsequent good control for 2.5 years. The dogs in the third group were poorly controlled for 5 years. Only in the first group of dogs was there no evidence of retinopathy. Surprisingly, there was progression of retinopathy in the second group during the good-control period.[6,15]

Elevated glycosylated hemoglobin. In 1976, Bunn et al[14] noted that the formation rate of HbA_{1c} was directly proportional to the time-averaged concentration of glucose within the erythrocyte, and, therefore, that the HbA_{1c} level in a diabetic patient could be used as a reflection of the adequacy of control over a sustained time period. It was the belief of Bunn et al that many diabetes complications were attributable to the cumulative effects of hyperglycemia, and the researchers suggested that serial measurements of HbA_{1c} might prove useful in monitoring diabetic patients and assessing the adequacy of control. In patients under 30 years of age, those who have more than 13.5% of their hemoglobin glycosylated are prone to proliferative diabetic retinopathy.[6]

Duration of disease. Of the risk factors mentioned, duration of disease—at the present stage of investigation—appears to be most important in diabetic retinopathy development.[6] In a study of noninsulin dependent diabetic patients, Frank et al[6,15] noted that diabetic retinopathy was uncommon in patients who had the disease less than 5 years. The incidence of background diabetic retinopathy increased to 27% in patients with the disease for 5–10 years and to 71% in patients with the disease for more than 10 years.[6]

Age at time of diagnosis. Of particular interest is that retinopathy is more strongly associated with diabetes duration after 13 years of age than before it.[6,16] In 143 children who developed insulin-dependent diabetes mellitus (IDDM) before the age of puberty, Jackson and others[16] noted that no retinopathy

developed before the onset of puberty regardless of disease duration. Although rare cases of severe retinopathy in prepubescent diabetic patients have been reported, it usually occurs only after puberty. The risk of retinopathy in 25-year-old patients is roughly the same regardless of the age of onset.[6]

Pathogenesis of diabetic retinopathy

Diabetic retinopathy pathogenesis is still undetermined despite years of intense research. Although chronic hyperglycemia has been recognized as the basis for diabetic retinopathy, the mechanism through which diabetic retinopathy occurs is unknown.[6,15] Aldose reductase, nonenzymatic glycosylation of proteins, vasoproliferative factors, ischemia and vasodilation, growth hormones, and platelets and blood viscosity are involved in the theories currently under investigation.

Aldose reductase. In 1974, Kinoshita[8,17] demonstrated the accumulation of sorbitol in the cataracts of diabetic patients. Aldose reductase mediates glucose conversion into sorbitol. Sorbitol accumulation with its consequent osmotic effects and damage to lens epithelial cells, which have a high concentration of aldose reductase, is thought to be responsible for the diabetic cataract. Similar processes are thought to occur in Schwann cells and retinal pericytes.[8]

Recent studies have demonstrated that, in hyperglycemia, many cells having increased intracellular sorbitol due to aldose reductase activity also display decreased intracellular concentrations of *myo*-inositol. This is thought to be due to an inhibition of cellular *myo*-inositol transport, which is corrected by aldose reductase inhibition. *Myo*-inositol, important in the synthesis of phosphoinositide, is a necessary sugar for cell membrane biosynthesis.[15]

Also, in cells with increased intracellular sorbitol, the activity level of protein kinase C and of cell membrane sodium-potassium-activated adenosine triphosphatase (Na+ K+ ATPase) is reduced. This condition is reversed by aldose reductase inhibition.[15]

Nonenzymatic glycosylation of proteins. In 1988, the theory of nonenzymatic glycosylation of proteins was suggested as an alternative to the sorbitol pathway theory as a cause of diabetic retinopathy.[15] It was suggested that glycosylation of critical proteins within the cell and in the extracellular matrix might be the mechanism responsible for diabetic retinopathy. Glucose molecules attaching onto the epsilon-amino groups of lysine residues on proteins, in direct proportion to ambient glucose concentration, is postulated to cause the cross-linking of these proteins. In proteins with enzymatic activity, this cross-linking would alter and possibly render ineffective their biologic activity, and, therefore, the extracellular matrix configuration and the capability or activity of certain types of cells such as macrophages.[15] In testing this hypothesis, it has been suggested that aminoguanidine, a specific inhibitor of nonenzymatic glycosylation, might be a therapeutic agent.[15]

Vasoproliferative factors. Another hypothesis proposes that the hypoxic retina produces or activates a vasoproliferative factor that diffuses to nearby blood vessels, inducing neovascularization. In the normal retina, there is a balance between factors promoting and inhibiting angiogenesis. Neovascularization occurs when this balance is upset by an overproduction or activation of angiogenic factors or by a reduction in the quantity or activity of inhibitory agents.[6,15] Clinical evidence supporting this hypothesis includes

1. Tumors produce an angiogenic factor that causes blood vessels from normal adjacent tissue to grow forward and into the tumor.[6]
2. In branch retinal venous occlusion, retinopathy of prematurity, Eales disease, and sickle cell retinopathy, ischemic areas of the retina are adjacent to areas of neovascularization, and the neovascularization tends to grow into the hypoxic areas.[6]
3. Neovascularization of the disc and iris, both of which can be reversed by panretinal photocoagulation, argue for a diffusible factor.[6]

Absence of potential inhibitors and the presence of angiogenic factors are responsible for neovascularization. This may explain why pericyte dropout occurs in neovascularization, and why microaneurysms occur with the loss of inhibitory factors for endothelial cell proliferation.[6]

Ischemia and vasodilation. An alternative hypothesis is that chronic hypoxia stimulates neovascularization by causing vessel dilation, which results in endothelial cell proliferation. During hyperglycemia, the retina consumes oxygen at a higher rate than normal. This results in dilation of retinal vessels as they autoregulate to keep the oxygen pressure in the tissue at normal level. The increased capillary blood pressure and chronic dilation causes increased vessel wall stretch, resulting in leakage and endothelial proliferation forming microaneurysms and new vessels.[6,8] Photocoagulation, therefore, is the specific treatment for diabetic retinopathy since it reduces oxygen demand and vasodilation.

Systemic growth factors. Other substances, such as growth hormone and an insulin-like growth factor 1 (IGF-1), produced systemically and arriving from sites other than the retina, are thought to play a role in some forms of retinal neovascularization. Recently, Merimee[18] reported elevated levels of IGF-1 in serum from PDR patients compared with diabetic patients without proliferative disease. Merimee[18] suggests that this molecule is responsible, in part, for diabetic retinopathy development. Evidence to support this theory is provided by the discovery of IGF receptors on cultured retinal microvascular pericytes and endothelial cells, and by the fact that both cells respond to IGF-1 with increased DNA (deoxyribonucleic acid) synthesis.[6]

Platelets and blood viscosity. The hypothesis that platelet abnormalities in diabetic patients contribute to diabetic retinopathy has been around for a while, but no recent research substantiates this. Past research has shown that platelets of diabetic patients are stickier than platelets of nondiabetic individuals,[6] and that platelets of diabetic patients are especially sensitive to thromboxane and other aggregating agents such as epinephrine.[6] It is thought that these abnormalities in platelet adhesion and aggregation result in focal capillary occlusion and focal areas of ischemia in the retina which, in turn, result in diabetic retinopathy.[6] Other hematologic abnormalities seen in diabetic patients, such as increased blood viscosity, increased erythrocyte aggregation, and decreased erythrocyte deformability, are also thought to contribute to diabetic retinopathy through sluggish circulation and endothelial damage.[6,8]

Pathology of diabetic retinopathy

Diabetic retinopathy is classified into three main stages: (1) nonproliferative (background diabetic retinopathy), (2) preproliferative (severe or advanced nonproliferative retinopathy), and (3) proliferative. Involvement of the choroid may occur in any of these stages. Since mortality rates of individuals in the three stages of retinopathy have been found to be 13.1%, 21.4%, and 39.5%, respectively, at least in Mexican-Americans, it behooves the practitioner to be able to identify these clinical stages on routine eye examination.[4]

Nonproliferative diabetic retinopathy. One of the earliest changes in nonproliferative diabetic retinopathy (NPDR) is capillary basement membrane thickening and pericyte dropout.[6,8] In normal eyes, the pericyte to endothelial cell ratio is 1:1. In diabetic patients, however, pericytes apparently die off and decrease in number. Capillary wall dilations occur in areas of absent pericytes, resulting in the development of microaneurysms—one of the earliest changes visualized with ocular examination. The microaneurysms may be quiescent for years, gradually disappear due to hyalinization and occlusion, or rupture, resulting in intraretinal hemorrhage.[8]

Hemorrhages, which usually occur in the inner plexiform, inner nuclear, or outer plexiform layers, may vary in size and become extensive when leakage occurs into the vitreous. Hemorrhages, occurring in the inner nuclear or outer plexiform layers, appear round or oval-shaped, while more superficial hemorrhages appear flame- or splinter-shaped.[8]

Exudates result from plasma leakage from microaneurysms or diffuse capillary leakage and tend to form in clusters. Serum leaks into surrounding retina from microaneurysms or leaking capillaries and the water content are taken up by surrounding retina and retinal pigment epithelium. This leaves a lipid-rich residue that accumulates mostly in the outer plexiform layer. These exudates may form a circinate pattern around clusters of microaneurysms, around large solitary microaneurysms, or around microaneurysms surrounding areas of capillary nonperfusion. The exudates, along with plasma leakage, may result in retinal thickening of the macula (macular edema)—the leading cause of reduced vision in patients with diabetes.

Large accumulations of fluid and exudate often collect in the outer plexiform layer of the parafoveal region, presumably because its anatomic configuration allows for more distensibility of the retina. These exudates are mostly extracellular and are composed of extracellular lipid and lipid-ladened histiocytes.[8] Large accumulations of fluid and exudate may occur in the outer plexiform layer of the macula in a cystoid pattern. Incoming light is scattered by the irregular surface of the retina, and visual acuity is decreased.[15,19,20]

In addition to retinal abnormalities found in background diabetic retinopathy, there may be involvement of the choriocapillaris. PAS-positive material thickens the walls of, and occasionally obliterates, the choriocapillaris.[8] Bruch's membrane appears quite prominent in histologic sections of the eyes of diabetic patients due to thickening of the choriocapillaris, which contributes to the outer portion of Bruch's membrane.[8]

The Early Treatment Diabetic Retinopathy Study reports[20–22] indicate that the risk of a patient with mild to severe NPDR developing PDR in a 5-year period is 25% to 80% (**Table 1**).[20–22]

Table 1. Risk of developing PDR based on ETDRS grade levels[20,22]

	Percent developing PDR over time		
ETDRS grade level of NPDR	**1 yr**	**3 yrs**	**5 yrs**
Level 35, mild	5	15	25
Level 43, mild to moderate	12	30	45
Level 47, moderate to severe	24	50	67
Level 53, severe	50	70	80

Table adapted from Bressler NM. Management of nonproliferative diabetic retinopathy. Johns Hopkins Resident Lecture Series. August 6, 1991.
PDR = proliferative diabetic retinopathy; ETDRS = Early Treatment Diabetic Retinopathy Study; NPDR = nonproliferative diabetic retinopathy

Preproliferative diabetic retinopathy

Preproliferative diabetic retinopathy or severe NPDR, in addition to causing changes mentioned above, also causes some background changes that may herald the onset of proliferative retinopathy. The Early Treatment Diabetic Retinopathy Study (ETDRS) found that venous beading and venous loops, multiple retinal hemorrhages, widespread capillary nonperfusion, widespread leakage on fluorescein angiography, and intraretinal

microvascular abnormalities (IRMA) are all risk factors for proliferative retinopathy (**Table 2**). Soft exudates are not found to be as significant.[21]

Venous beading—a clinical term—is the end stage of a process in which veins develop fusiform changes, eventually acquiring a sausage-like appearance.[8] Some beaded veins in diabetic retinopathy are due to intraretinal, perivenous neovascularization. Recent studies have shown that the percentage of people developing PDR who have venous beading for 1–5 years increases from 40% to 80%.[20,22,23]

Table 2. Risk of developing PDR as determined by fundus features[21]

Fundus features	Percent developing PDR over time		
	1 yr	3 yrs	5 yrs
Venous beading	40	60	80
Extensive microaneurysms (D4-5)	10	20	40
Intraretinal microvascular abnormality	20	40	60

Table adapted from Bressler NM. Management of nonproliferative diabetic retinopathy. Johns Hopkins Resident Lecture Series. August 6, 1991.
PDR = proliferative diabetic retinopathy

The presence of microaneurysms is a risk factor in diabetic retinopathy. The approximate risk of developing PDR in diabetic patients who have extensive (D4-5) microaneurysms for 1–5 years is 10% to 40%.[8,20,23] The term "extensive (D4-5) microaneurysms" refers to many definite (D) microaneurysms in at least four to five fields. Finding one to two microaneurysms in a diabetic patient's eye is not considered prognostic.

Shunt vessels, dilated capillaries, and IRMA also are important predictors of PDR.[8,20,23] The dilated capillaries in IRMA apparently function as collateral channels and bear strong resemblance to surface neovascularization of the retina. Unlike neovascularization, however, which leaks profusely with intravenous fluorescein angiography, the dilated capillaries in IRMA do not. These areas of IRMA surround variably sized areas of capillary nonperfusion. The risk of developing PDR increases from 20% to 60% in patients having IRMA for 1–5 years.[20,23]

Cotton wool spots (soft exudates, which represent microinfarctions of the nerve fiber layer), once thought to be an important warning sign for PDR, are no longer considered an important risk factor.[21] Cotton wool spots result from occlusions or infarctions of precapillary arterioles with resultant axonal swelling (cytoid bodies).

With increasing duration of the preproliferative diabetic retinopathy stage, terminal arterioles begin to develop hyaline thickening, corkscrew coiling, and narrowing of the lumen. Venous loops and varicosities develop, and the pericyte and endothelial cell basement membrane thickens. The capillary wall layers become separated by lipid and debris, and, eventually, the pericytes and endothelial cells disappear. The result is the formation of nonfunctioning ghost capillaries and widespread areas of capillary nonperfusion.[8]

Proliferative diabetic retinopathy

Proliferative diabetic retinopathy, in addition to containing all of the features of background and preproliferative diabetic retinopathy, is characterized by neovascularization with extension into the vitreous in the region of the disc (NVD) and elsewhere in the retina (NVE). NVD is characterized by new vessel formation arising directly from the optic nerve head or within the peripapillary retina less than one disc diameter from the optic nerve head margin. These new proliferative vessels usually arise from preexisting veins and, early on, appear as small or large collections of fine naked vessels on ophthalmic examination. Eventually, gliosis and fibrosis, vitreous hemorrhage, and traction retinal detachment may occur. More limited traction may result in dragging of the optic disc and macular heterotopia.[8] Eventually, the patient is left with hand-movement vision or worse, if left untreated.

In PDR, new vessels that form along the inner retinal surface are thin walled and have poorly developed junctional complexes and fenestrated endothelium, which allows for serum leakage and occasional vitreous hemorrhage.[6,8] The new vessels apparently grow or are pulled into the direction of least or lower resistance. With NVD, the lack of an internal limiting membrane (ILM) at the optic nerve head allows for an abundant proliferation of new vessels that are capable of expanding onto the posterior surface of the vitreous. With NVE, new vessels extend into the vitreous and onto the posterior surface of detached vitreous.[8]

Posterior vitreous detachment is more common in diabetic than nondiabetic subjects studied postmortem.[6,8] Cells with the contractile protein actin have been observed by electron microscopy with the use of myosin subfragment 1 in a surgical specimen from a patient with a retinal detachment and PDR.[8] With neovascular tissue contraction, tension is placed on the vitreoretinal bands, which in turn places tension on new vessels, which may bleed. This results in traction of the retina with production of cystic degeneration, schisis, and retinal detachment with or without tears.

Management of diabetic retinopathy

Visual loss in diabetic retinopathy patients is caused by clinically significant macular edema (CSME), macular nonperfusion, or the sequelae of proliferative retinopathy. Powerful randomized clinical trials have shown that the first and third causes of visual loss are treatable or avoidable. Because even advanced retinopathy may be asymptomatic, the

Table 3. Screening recommendations[24]

Age at onset of diabetes mellitus	Initial exam	Subsequent exam
0-30	5 years after diagnosis	Annually*
30+	At time of diagnosis	Annually*

** more frequent follow-up indicated based on increasing disease severity*

key to diabetic retinopathy management is timely detection of treatable disease **(Table 3)**. To develop a rational screening strategy for patients with diabetic mellitus, one must know the epidemiology of CSME and proliferative retinopathy. The prevalence of these key features relates chiefly to disease duration.

Since CSME and PDR may be asymptomatic, since they respond to treatment (details outlined below), and since screening is cost effective for society,[7] numerous organizations, including the American Academy of Ophthalmology and the American Diabetes Association, have published guidelines for screening:[24]

1. What is the status of the diabetic retinopathy—nonproliferative, severe nonproliferative, or proliferative?
2. Is there macular edema?
3. Does the patient have risk factors for the development of proliferative retinopathy or high-risk proliferative retinopathy?
4. Does the patient have features of high-risk PDR?[6,24-26]

Clinical trials have shown that macular edema treatment is indicated only when it is clinically significant. Macular edema is defined by the ETDRS group as thickening of the retina within one disc diameter of the macula or hard exudates greater than or equal to standard photograph 3 in a standard 30° photographic field centered on the macula (field 2) with some hard exudates within one disc diameter of the center of the macula.[19,22]

CSME is defined as thickening at or within 500 μm of the center of the macula, or hard exudates at or within 500 μm of the center of the macula if associated with thickening of the adjacent retina, or a zone or zones of retinal thickening one disc area in size at least part of which is within one disc diameter of the center of the macula.[22,25-27] CSME is a clinical diagnosis. It is observed with the use of stereo slit lamp biomicroscopy and does not necessitate the use of intravenous fluorescein angiography.[28]

Patient visual acuity is not considered part of the criteria for CSME, although caution is recommended when treating 20/20 eyes. Treatment of macular edema that is not clinically significant has not been found to be of value in visual loss prevention.[19-21] Treatment of CSME has been found to reduce the risk of visual loss and to improve vision. CSME treatment is guided by the findings of intravenous fluorescein angiography. Focal laser treatment is applied to treatable lesions—areas of leaking microaneurysms and abnormal capillaries—and light scatter or grid to areas of diffuse leakage not attributed to focal microaneurysms or abnormal capillaries.[25,26]

High-risk PDR is defined as the presence of new vessels on or within one disc diameter of the optic nerve (NVD) greater than or equal to standard photograph 10A[18] (about 1/4 to 1/3 disc area), with or without vitreous or preretinal hemorrhage, or vitreous or preretinal hemorrhage accompanied by new vessels, either NVD less than or equal to standard photograph 10A,[19] or new vessels elsewhere (NVE) greater than or equal to disc area.[22] The chance of developing high-risk PDR increases from 21.7% to 63.8% in patients having mild PDR for 1–5 years. In patients with moderate PDR, the risk increases from 45.5% to 74.7% in 1–5 years.[22] Studies conclude that patients with high-risk PDR should be treated promptly with scatter laser photocoagulation outside of the arcade **(Table 4)**.[22,29]

Patients with severe NPDR associated with intraretinal microvascular abnormalities and venous beading have about a 50% risk of developing PDR over the next 1–2 years, and a 20%–25% risk of developing high-risk diabetic retinopathy over the course of two years. As mentioned before, patients with

Table 4. Development of high-risk proliferative retinopathy in all eyes (assigned to deferral by baseline retinopathy severity level)*

	Cumulative rate (%) of high-risk PDR at visit		
Baseline retinopathy severity[21]	**1 yr**	**3 yrs**	**5 yrs**
Level ≤ 35 (mild NPDR)	0.8	6.7	15.5
Level 43 (moderate NPDR)	3.3	14.2	26.5
Level 47 (moderately severe NPDR)	8.6	24.4	39.4
Level 53a-d (severe NPDR)	14.6	39.5	56.0
Level 53e (very severe NPDR)	45.0	64.9	71.3
Level 61 (mild PDR)	21.7	48.6	63.8
Level ≥ 65 (moderate PDR)	45.5	67.2	74.7
Total	12.1	28.0	40.7

**Includes eight eyes classified as not having high-risk proliferative diabetic retinopathy (PDR) by eligibility grading, but classified as having high-risk PDR on subsequent detailed grading. Modified from ETDRS report number 12.[22]*

PDR who do not fit the criteria for high-risk diabetic retinopathy also apparently have a 50%–75% risk of developing high-risk PDR over the next year. Due to these findings, it is recommended that reliable patients be followed and observed at three-month intervals, and that laser panretinal photocoagulation (PDR) be promptly initiated when high-risk PDR occurs.[22] For patients with bilateral severe NPDR or mild proliferative retinopathy, many retina specialists favor initiation of PRP in one eye.

PRP is known to exacerbate macular edema. In fact, in the ETDRS, patients who received early scatter treatment had an increased rate of mild visual loss from macular edema, although they did have reduced severe visual loss.[22] For this reason, many retina specialists recommend aggressive treatment of CSME in those patients at high risk of developing PDR prior to the initiation of PRP. CSME is also treated aggressively prior to, or concomitant with, PRP for non-high-risk PDR. For patients with CSME and high-risk PDR, many retina specialists are reluctant to defer PRP while treating CSME. CSME may be treated after or during PRP.

The key goals of diabetic retinopathy management are

1. Development of a good relationship with the primary care provider to enhance optimal diabetic control and management of high blood pressure and serum lipids.
2. Identification of patients with CSME and PDR.
3. Treatment of CSME, prior to PRP when possible.
4. Treatment of high-risk PDR with PRP, and PRP for some patients as they approach high-risk PDR.
5. Vitreous surgery for patients who develop complications of PDR such as macular traction detachment or nonclearing vitreous hemorrhage.
6. Low vision rehabilitation for patients who do not respond to treatment.

It is hoped that with better screening and earlier detection and treatment, diabetic retinopathy may be prevented or controlled. Because of the availability of effective treatment, the American Academy of Ophthalmology initiated the long-term education project, *Diabetes 2000.*[30] The project was designed to increase the speed with which research findings are translated into medical and surgical benefits for the American public. The primary goal of *Diabetes 2000* is the elimination of treatable diabetic blindness by the year 2000. It is hoped that *Diabetes 2000* will close the gap between advances in research and changes in treatment patterns. Drs. Ronald E. Smith and Arnall Patz, leaders of the American Academy of Ophthalmology, stated the following: "As ophthalmologists, we are the physicians uniquely qualified to diagnose and treat diabetic retinopathy. By continuously updating our medical knowledge of this multisystem disorder, and by forging partnerships with primary care physicians for more effective and efficient management of these patients, we have an even greater opportunity: we can significantly reduce blindness due to diabetes by the year 2000."[30]

Hypertension: A review with emphasis on therapeutics with ACE inhibitors

Harry G. Preuss, M.D.; Javed A. Gondal, Ph.D.; and James F. Burris, M.D.

From the Georgetown University Medical Center where Dr. Preuss is professor of medicine (nephrology) and pathology; Dr. Gondal is a research fellow of medicine (nephrology); and Dr. Burris is professor of medicine and associate professor of pharmacology.

ABSTRACT: *Hypertension, more prevalent with aging, is a major risk factor for cardiovascular disorders. Accordingly, it is important to decrease blood pressure and maintain it in an acceptable range to lessen morbidity and mortality. When nonpharmacological therapy fails, drug therapy should be instituted. The ideal drugs lower blood pressure, have few adverse side effects, and may have additional benefits on coexisting maladies. ACE (angiotensin-converting enzyme) inhibitors are excellent first-line drugs because they have few adverse effects and may have additional benefits on cardiac and renal status. This overview discusses many aspects of hypertension and its therapy, but emphasizes use of ACE inhibitors in the elderly.*

Ameliorating hypertension is a significant challenge to practicing physicians because elevated pressure is a major risk factor for cardiovascular disorders—the leading cause of death in this country.[1] Approximately 50% of all mortality can be attributed to cardiovascular disorders, primarily myocardial infarctions and strokes.[2] Additional complications associated with blood pressure elevation are renal failure, left ventricular hypertrophy, left ventricular failure, angina pectoris from coronary artery disease, hypertensive encephalopathy, cerebrovascular disease, cerebral thrombosis and hemorrhage, transient ischemic attacks, and peripheral vascular disease.

Because hypertension is such an important risk factor, it is necessary that the entity be defined definitively. Hypertension is a consistent elevation of blood pressure—systolic, diastolic, or combined. In general, normal adult systolic blood pressure is below 140 mm Hg, and diastolic blood pressure is below 90 mm Hg. Blood pressure consistently above the acceptable range is associated with significant increases in cardiovascular morbidity and mortality.[3] Normal readings are lower in infancy and youth and, characteristically, rise with age. Therefore, upper limits of pressure normality are lower

in younger individuals. The following upper limits of normality are reasonable: children under 6 (110/75 mm Hg), 6 through 9 years of age (120/80 mm Hg), 10 through 13 years (125/85 mm Hg), and 14 through 18 years (135/90 mm Hg).[4]

It is useful to further subclassify blood pressure in adults: **mild hypertension** (diastolic 90–104 mm Hg), **moderate hypertension** (diastolic 105–114 mm Hg), **severe hypertension** (diastolic ≥ 115 mm Hg).[5] About 80% of hypertension is mild, while less than 5% is severe. Often, diastolic pressure remains within the normal range and only systolic pressure is elevated. **Isolated systolic hypertension** (>160 mm Hg)—especially prevalent in the elderly with poorly compliant vasculature—includes **borderline isolated systolic hypertension** (140–159 mm Hg).

Hypertension is also classified in terms of etiology. Unfortunately, pathogenesis is unknown in most cases.[6] **Essential hypertension** is blood pressure exceeding the accepted range of normality, for which no specific etiology can be found after a thorough attempt is made to discover the cause. This is commonly called **primary** or **idiopathic hypertension**. The majority of hypertensive patients have essential hypertension (> 90% with consistently elevated pressure readings). In most populations, systemic blood pressure rises as aging progresses, and development of hypertension is often referred to as age-related. In addition, race, gender, heredity, and environmental factors—such as nutrition and various toxins—may contribute to the overall rise in pressure. **Table 1** lists many of the common conditions associated with primary hypertension.

By definition, the etiology of **secondary hypertension** is understood. Underlying causes (also listed in **Table 1**) include renal (the most common association), endocrine, vascular, and other diseases. When recognized early, the underlying cause for secondary hypertension often can be removed, curing the patient or, at least, ameliorating pressure elevation.

Hypertension, along with degenerative arthritis, is a common chronic disorder in the elderly. Accepting the above pressure ranges, hypertension afflicts 25% to 30% of the overall population.[7] Although elevated blood pressure is more prevalent with aging, it is still somewhat surprising to find that roughly 50% of those over 50 and 66% of those over 65 are hypertensive.[8,9] Among whites, elevated blood pressure is seen equally in both genders. In African-Americans, more females are burdened with hypertension. More than three of four African-American females over age 65 are considered hypertensive by the criteria given above.[8] Among African-Americans and the elderly, hypertension is also associated with more deleterious events.[9]

Because the proportion and absolute number of elderly persons is increasing rapidly, hypertension will become an even greater public health problem in the future. Over 31 million Americans are 65 or older, and by the year 2030, almost 20% of the population will exceed 65.[3] Rosenfeld[10] estimates that, eventually, physicians will spend 75% of their time treating elderly patients with hypertension and cardiovascular disorders. Therefore, knowledge concerning all aspects of age-related blood pressure elevation is crucial.

Table 1. Conditions or factors associated with blood pressure elevation

Essential hypertension

- Age
- Heredity, probably multiple genes
- Dietary factors: Na, K, Mg, Ca, fats, fibers, sugars
- Obesity
- Growth
- Stress
- Alcohol
- Increased cardiac output
- Impaired responsiveness of baroreceptors
- Cardiac and vascular hypertrophy

Secondary hypertension

- Renovascular disease
- Renal disease
- Coarctation of the aorta
- Endocrine diseases: Conn's and Cushing's syndromes, pheochromocytoma
- Drugs: steroids, contraceptive pill

Clinical evaluation and diagnosis

Blood pressure constantly changes. It is well recognized that diurnal variations in pressure exist, with the lowest readings usually occurring at night.[4] In addition, many exogenous factors can alter pressures for brief intervals.[11] Therefore, it is necessary to take as many readings as possible to establish a hypertension diagnosis before committing a patient to lifelong treatment.

Many avoidable factors affect and increase blood pressure. "White coat syndrome" is a well-recognized entity: blood pressure rises due to anxiety when the physician is about to take a measurement. Thus, the patient must be placed at ease prior to assessment. Extraneous factors that could affect blood pressure should be eliminated. These include exertion, eating within minutes of the reading, cold, bladder distention, anxiety, and lack of sleep. Medications, such as estrogen, adrenal steroids, and adrenergic drugs (diet pills), can also affect blood pressure.

Evaluating blood pressure requires many considerations.[12] To take a pressure, the cuff should be of adequate size. Too narrow a cuff tends to give a high reading. When obtaining a routine pressure measurement, inflate the cuff to a level just above the expected systolic pressure. This can be accomplished by simultaneously palpating the radial artery and noting the disappearance of the pulsation. This maneuver has additional benefit in the elderly.[13] If the artery remains palpable after the pulse disappears, this suggests the vessel is calcified and is associated with an aberrantly high reading—**pseudohypertension**. Calcification of vessels reduces compliance, leading to errors in evaluating pressure in the elderly.

Over the years, measurement of diastolic pressure has been controversial. At present, it is generally accepted that diastolic pressure is recorded when the sounds disappear completely. In certain cases, ambulatory pressure readings may prove useful.[14]

Overall assessment objectives of a hypertensive patient are threefold: to determine if correctable causes for pressure elevations exist; to establish the presence of hypertension complications; and to check whether contraindications exist for the chosen therapy. Many disorders are associated with high blood pressure, including obesity,[15] diabetes mellitus,[16] and renal failure.[17] Potentially correctable causes of hypertension include pheochromocytoma, Cushing's syndrome, coarctation of the aorta, renal artery stenosis, unilateral renal disease, hyperthyroidism, and hyperaldosteronism. Much information on etiology and complications of hypertension can be found by conducting a thorough medical history.

Physical examination may reveal findings such as atrioventricular (AV) nicking, vasoconstriction, hemorrhages, exudates, or other perturbations of the cardiovascular system that suggest chronic elevation of blood pressure. Routine laboratory examination (**Table 2**) consists of urinalysis, blood urea nitrogen (BUN), creatinine, electrolytes, chest x-ray, blood count, sedimentation rate, and electrocardiogram. If warranted, special examinations may pinpoint etiology. These investigations include intravenous pyelogram (IVP), renal arteriography, plasma renin activity (PRA), aortography, computerized axial tomography (CAT) scan, urinary catecholamines, echocardiogram, and ambulatory pressure monitoring.

A hypertensive emergency is when blood pressure elevation is severe enough to cause rapidly progressive end-organ damage. This may occur when blood pressure rises rapidly from normotensive levels to moderately hypertensive levels (200–225/130–140 mm Hg), such as in toxemia of pregnancy or acute glomerulonephritis. Hypertensive emergency more commonly occurs when essential hypertension is inadequately treated, and blood pressure rises gradually to levels in excess of 175–200/110–130 mm Hg. Patients typically present with a variety of symptoms, including headache, dizziness, blurred vision, shortness of breath, chest pain, and frequent urination. Patients sometimes develop cerebrovascular events, myocardial infarctions, congestive heart failure, or acute renal failure. Because clinical features of hypertensive crisis are often nonspecific, accurate diagnosis depends on a careful history, a physical examination, and a brief laboratory screen for evidence of end-organ dysfunction. Prompt, aggressive therapy is necessary to forestall permanent impairment of vital organs and even death.

Physicians should not overreact to severe blood pressure elevations that pose no immediate threat of organ damage. Under such circumstances, excessive lowering of blood pressure can precipitate acute ischemic events. This is especially risky in older patients with long-standing hypertension, poorly compliant vessels, and diminished baroreceptor responsiveness. Severe hypertension without imminent target organ damage can be considered **hypertensive urgency**, requiring lowering of pressure within hours to days, rather than the minutes to hours required in a true hypertensive emergency.

Overview of therapeutics

Ameliorating hypertension reduces early mortality, strokes, congestive heart failure, renal failure, and accelerated hypertension. Previous experience, however, indicates that the reduction of coronary heart disease is less evident in hypertensive patients undergoing pressure reduction with drug therapy. This may be due to adverse effects of diuretics and beta blockers on lipid and carbohydrate metabolism.[4] Most long-term studies have used these two types of drugs. While decreases in pressure derived from these two classes of antihypertensive agents may be beneficial, secondary metabolic perturbations may offset benefits. This has led some physicians to switch drug therapies

Table 2. Considerations in hypertension workup

Routine investigations

- Urine analysis
- Blood urea nitrogen, creatinine and electrolytes
- Chest x-ray
- Blood count and erythrocyte sedimentation rate
- Electrocardiogram

Special investigations

- Intravenous urography
- Renal arteriography
- Plasma renin, angiotensin II, and aldosterone
- Adrenal venography
- Computerized axial tomography (CAT) scan
- Plasma cortisol
- Aortography

from the older drugs to the new angiotensin-converting enzyme (ACE) inhibitors and calcium channel blockers. These two classes are associated with fewer and less severe adverse reactions.

Therapy may take the form of nonpharmacologic or pharmacologic interventions. Prior to committing the patient to drug therapy, one should remove adverse environmental factors influencing blood pressure. Many of these factors are listed in **Table 3**. Recognition of these factors suggests obvious remedies. For example, obesity and excess sodium and alcohol intake are frequently associated with hypertension. Therefore, losing excess weight and limiting sodium and alcohol intake are useful and generally accepted measures. Less accepted are adding potassium, calcium, and fiber to the diet and removing dietary sugars, fats, and alcohol. Exercise and relaxation therapy may be helpful, as well.

Table 3. Some exogenous factors influencing blood pressure

- **Dietary**
  - Calories
  - Micronutrients
    - Na (sodium)
    - K (potassium)
    - Ca (calcium)
    - Mg (magnesium)
    - P (phosphorus)
  - Macronutrients
    - Fats (saturated, unsaturated, 3 omega fatty acid)
    - Proteins
    - Carbohydrates (refined, complex, fiber)
  - Alcohol
- **Environmental**
  - Cadmium
  - Lead

Following inadequate responses to nonpharmacologic attempts to lower pressure, pharmacologic methods must often be instituted. A significant problem is untoward effects that can occur with pharmacologic agents. Numerous factors associated with aging—including pharmacokinetic and pharmacodynamic factors—make geriatric patients especially susceptible to adverse reactions. The most common perturbation associated with antihypertensive therapy is hypotension. The elderly are more susceptible to orthostatic hypotension because the baroreflex sensitivity, the response to catecholamines, and the intravascular volume generally decrease. Commonly used drugs, such as thiazides, often cause systemic potassium depletion. In addition to an enhanced tendency to hypokalemia, the elderly often have impaired drug metabolism, putting them at risk for excess drug accumulation. No antihypertensive drug is completely effective and safe for all individuals. Regimens must be individualized, and the physician must be ready to revise them when necessary.

Drugs commonly used in the elderly are often the same as those considered for younger patients. Major classifications of drugs for treating hypertension are listed in **Table 4**. Exactly how these drugs work to reduce blood pressure is largely uncertain. For example, theoretically, ACE inhibitors should decrease blood pressure by blocking formation of angiotensin II, but these agents are effective in many patients with low renin forms of hypertension. Some believe the ACE inhibitors may work through increased production of vasodilatory prostaglandins or kinins.[18,19] The following discussion briefly describes many classes of hypertensive agents, emphasizing ACE inhibitors.

Diuretics (thiazides, loop, and potassium-sparing). Use of oral diuretics to lower blood pressure has been well recognized for over 30 years. Thiazides—the diuretics used most for lowering pressure—come in many forms with different durations of action. Interestingly, long-term action is not closely related to diuretic action. While the initial mode of action may relate to lowering blood volume, the ultimate effect may be through reduced blood pressure responsiveness to endogenous vasoconstrictors. Thiazides definitely lower the incidence of stroke, but not coronary artery disease, perhaps because the metabolic effects negate the benefits of lowered pressure.[20] Nevertheless, diuretics are relatively inexpensive and often potentiate the actions of other agents. They may be used in the future in low doses as adjuncts to other therapeutic agents.

Table 4. Classification of common antihypertensive drugs

- Diuretics
  - Thiazides
  - Loop diuretics
  - Potassium-sparing diuretics
- Beta blockers
- Alpha blockers
- Combined beta and alpha blockers
- ACE inhibitors
- Calcium channel blockers
- Central alpha 2 agonists
- Direct -acting vasodilators

Diuretics often cause deleterious side effects. Some skin rashes and allergic reactions have been seen. Many electrolyte imbalances occur secondary to usage. The most common effects are hypokalemia, hypercalcemia, hyponatremia, and hypomagnesemia. Glucose intolerance, hyperuricemia, and hypercholesterolemia are not uncommon. Because hypokalemia is prevalent and serious, it is often recommended that the drugs be given with oral potassium supplementation or combined with a potassium-sparing diuretic, such as Aldactone (spironolactone), triamterene, or amiloride hydrochloride. Recent interest focuses on antihypertensive agents that can prevent or reverse left ventricular hypertrophy. In this respect, diuretics are less effective than several other agents.

Beta blockers (atenolol, metoprolol tartrate, pindolol, propranolol hydrochloride, timolol maleate). Beta blockers are particularly effective in young people with high cardiac output. They may possibly decrease cardiac output, lower circulating renin activity, prevent prejunctional uptake of catecholamines, or influence a central mechanism. Beta blockers differ in several ways. Some have partial agonistic or intrinsic sympathetic activity. There are differences in lipid solubility. Also, they may differ in relative selectivity in blocking beta 1-receptors in the heart versus beta 2-receptors elsewhere. Beta blockers, as suggested above, are most effective in those patients with tachycardia and high cardiac output. They are especially useful in hypertensive patients experiencing angina, migraines, or glaucoma.

As with diuretics, there are concerns about side effects. Some patients experience lethargy and intellectual impairment. Bad dreams, hallucinations, and depression are also associated. In addition, beta blockers can cause bronchoconstriction, peripheral circulatory impairment, and an adverse lipid profile. Diabetic patients receiving insulin simultaneously with beta blockers are especially prone to hypoglycemic episodes.[21] Reports concerning the ability of beta blockers to prevent or reverse left ventricular hypertrophy are inconsistent.

Alpha blockers (prazosin hydrochloride, terazosin). Alpha blockers, like prazosin hydrochloride and terazosin hydrochloride, effectively lower pressure, but have not attained the popularity of other antihypertensive drugs—probably because of a tendency to cause frequent and severe episodes of postural hypotension. They have a favorable effect on lipid profile, however, and do not lower potassium.

Combined alpha and beta blockers. Labetalol hydrochloride has both alpha and beta blocking effects. Therefore, it is not surprising that it has the benefits and adversities associated with individual drugs of each classification.

Calcium channel blockers (nifedipine, diltiazem hydrochloride, verapamil hydrochloride). Calcium channel blockers may work through their influence on intracellular calcium concentrations.[22] Calcium channel blockers are divided into three categories: verapamil hydrochloride, nifedipine, and diltiazem hydrochloride. Differences in these categories greatly depend on the agents' inotropic and chronotropic properties. Calcium channel blockers are well tolerated, may slow atherosclerosis, and work equally well in African-Americans and whites. Because these agents dilate coronaries and peripheral vasculature, they are quite useful in ameliorating various ischemic disorders. These agents, depending on the one chosen, are associated with constipation, headaches, and occasional edema. Specifically, verapamil is most likely to cause myocardial depression, excessive bradycardia, A-V nodal dysfunction, constipation, postural dizziness, headache, and nausea. Diltiazem is frequently associated with nausea, ankle edema, headache, and rash. Nifedipine causes flushing, headache, postural dizziness, and ankle edema. It is worth reemphasizing that these agents are useful in African-Americans and the elderly. Like ACE inhibitors, the high cost limits general usage.

Central agonists (methyldopa, clonidine, guanabenz acetate). Central agonists stimulate alpha-2 receptors in the brain, decreasing sympathetic outflow from the central nervous system. These agents include methyldopa, clonidine, and guanabenz acetate. Methyldopa has autoimmune effects that may result in a positive Coombs' test, abnormal liver function, or even severe liver disease. All the agents may cause impotency, sedation, dry mouth, and decreased mental awareness.

Direct vasodilators (hydralazine hydrochloride, minoxidil). Direct vasodilators cause vascular relaxation, lowering vascular resistance. Among the drugs in this group are minoxidil and hydralazine. Both agents are associated with increased heart rate and fluid retention, often requiring supplemental agents to overcome these adverse effects. In addition, minoxidil is associated with hirsutism. These are considered third-line agents, used more or less for refractory hypertension.

ACE inhibitors (captopril, enalapril maleate, lisinopril, benazepril hydrochloride, ramipril)

It has long been recognized that the renin-angiotensin system may play a significant role in the hypertensive process and that altering it through therapeutic means might provide an excellent result against hypertension. Renin is a proteolytic enzyme secreted into the circulation by kidneys. The chief source of production is granular-containing cells in the renal juxtaglomerular apparatus. This enzyme is capable of breaking down a circulating glycoprotein into a decapeptide called angiotensin I. On its own, angiotensin I has little physiological action, but when cleaved to an octapeptide by another proteolytic enzyme called angiotensin-converting enzyme (ACE), a very active product, angiotensin II, is formed. ACE is present in the circulation and on the endothelial surfaces of blood

vessels. Because so much is localized in pulmonary circulation, much angiotensin II is formed in the lungs. While emphasis is placed on circulatory aspects of this system, it is well known that the renin-angiotensin system is located in various organs. For example, the kidney itself can form its own angiotensin II. It is also believed that this system is significantly present in the blood vessel walls.

Accordingly, blocking formation of angiotensin II markedly affects blood pressure because angiotensin II has a number of obvious actions that influence pressure regulation. Some known actions are (a) direct constriction of arteries to increase peripheral resistance, (b) stimulation of the central and peripheral nervous systems to enhance sympathetic activity, (c) augmentation of aldosterone secretion increasing renal sodium absorption and volume expansion, (d) direct effects on renal filtration and tubular function to increase sodium reabsorption, (e) influence centers in the brain to enhance ADH (antidiuretic hormone) secretion causing water retention and direct vasoconstriction, and (f) augmentation of thirst.

Not surprisingly, inhibiting conversion of relatively inactive angiotensin I to angiotensin II via ACE-inhibition lowers pressure. It is somewhat surprising, however, that ACE inhibitors are quite effective in patients with low renin forms of hypertension, including age-related hypertension. The explanation for this may be twofold. Activity of the renin-angiotensin system in the vessels may not be reflected in plasma measurement. Even though plasma activities are low, the system located in the vasculature may be the basis for pressure elevation and may be affected by ACE inhibitors. The second reason is that ACE inhibitors influence catabolism of kinins, such as bradykinin. Concentrations of vasodilatory bradykinin are augmented by ACE inhibitors. In turn, either through direct effect or enhancement via kinins, concentrations of vasodilatory prostaglandins increase. Therefore, many pressure-lowering effects of ACE inhibitors may work by mechanisms other than those related to actions of angiotensin II.

It is worth reemphasizing that, although ACE inhibitors block production of angiotensin II, they may also reduce aldosterone secretion, increasing bradykinin and prostaglandin concentrations and decreasing responsiveness of vascular smooth muscle to sympathetic neural activity.[18,19,23] In any case, they lower pressure by decreasing peripheral vascular resistance. Most ACE inhibitors are once-a-day preparations and are well tolerated.

ACE inhibitors reduce mortality and hospitalization of patients with symptomatic congestive heart disease.[24–28] Recent evidence suggests ACE inhibitors reduce the need for hospitalization for heart failure in patients with asymptomatic left ventricular dysfunction.[28] Effects were noted as early as six weeks after initial therapy. Major side effects were hypotension, cough, and elevated serum potassium concentrations. Whether they are beneficial to cardiovascular complications following acute myocardial infarction is still controversial[29,30] and awaits further examination to determine if previous differences among studies are due to the temporal initiation of therapy and dosage.[31] Many experts suggest the use of ACE inhibitors in hypertensive diabetic patients, as the ACE inhibitors have been shown to preserve renal function and decrease insulin resistance.[32]

Cough is the most common and irritating side effect. Angioedema, although rare, is perhaps the most dangerous and may occur in 1/3,000 patients. Less common side effects include first-dose hypotensive response in patients taking vasodilators or diuretics before commencing therapy. Physicians should be aware of the possibility of hypotension in patients with low circulating blood volume, keeping the elderly in mind. Hyperkalemia may occur, especially in diabetic patients, patients with renal failure, and those taking potassium-sparing diuretics. Taste disturbance, rash, and proteinuria with introduction of these agents are less common with the newly recommended lower doses. Patients with diffuse atherosclerosis or bilateral renal artery stenosis have developed acute renal failure when given these agents. Fortunately, this is usually reversible when the agent is stopped. On the bright side, ACE inhibitors do not adversely affect sexual potency.

It is important to note that ACE inhibitors are reportedly less effective in African-Americans, but low doses of a diuretic markedly increase potency. As indicated, ACE inhibitors are quite effective in the elderly. Because of beneficial effects on heart function and the ability to reduce insulin resistance, they have been recommended as the antihypertensive of choice for diabetic patients and those with heart failure. Unfortunately, high cost often precludes usage.

Table 5. Characteristics of an ideal first-step antihypertensive drug

- ✧ Effective as monotherapy
- ✧ Easy to titrate
- ✧ Well tolerated with few side effects
- ✧ Compatible with other antihypertensive agents
- ✧ Reduces mortality and morbidity
- ✧ Minimal contraindications
- ✧ Minimal interactions with other commonly used agents
- ✧ Once-a-day dosing
- ✧ Low cost

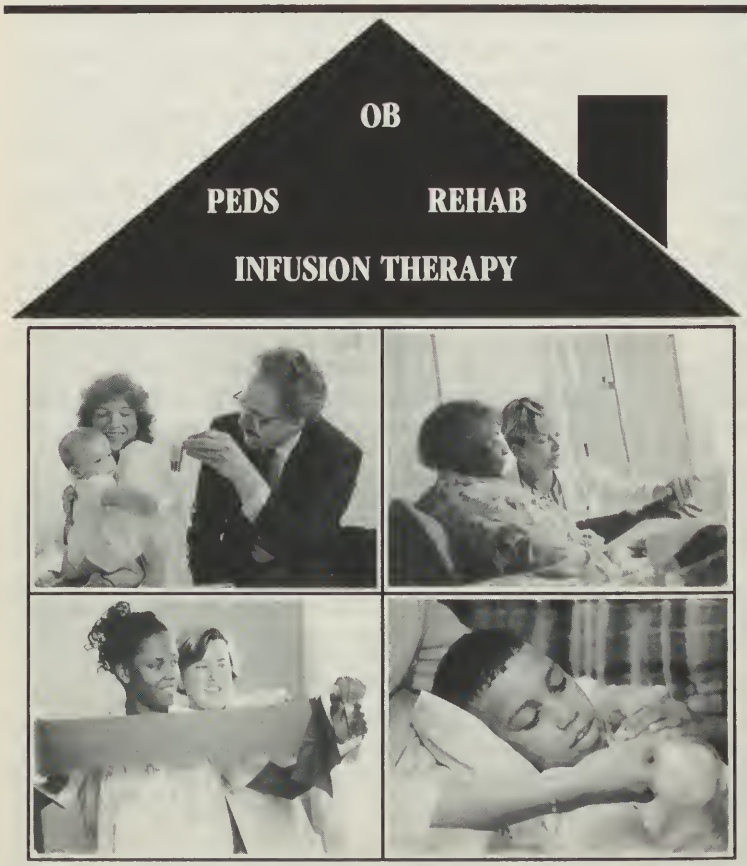
Summary of pharmacological approaches

The current approach to pharmacological therapy is to individualize treatment to suit each patient rather than instituting a specific, rigid regimen (Step Care). Characteristics of an ideal first-step antihypertensive drug are listed in **Table 5**. In general, all antihypertensive agents

effectively lower blood pressure in the majority of patients, but certain agents work more effectively in individual patients. Today, initial therapy is based largely on (a) whether the agent is also effective in treating another medical condition (such as angina, migraine headaches, or congestive heart failure), (b) adverse reactions, and (c) cost.

Regarding secondary actions of antihypertensive agents, many hypertensive patients harbor additional disorders that may benefit from proper drug selection. Because left ventricular hypertrophy is a significant risk factor for mortality,[33,34] much attention is placed on using agents that prevent or ameliorate this disorder. Some, but not all, antihypertensive agents have the potential to prevent or reverse left ventricular hypertrophy. For patients with migraine headaches, beta blockers may be particularly useful. For angina patients, beta blockers and calcium antagonists may serve a double purpose. ACE inhibitors work well for diabetic and congestive heart failure patients. The ability of ACE inhibitors to overcome insulin resistance may aid in prevention of atherosclerosis because insulin resistance has been associated with its development. In the same vein, alpha adrenergic blockers are associated with an improved lipid profile.

On the other hand, each class of agents harbors adverse effects. Diuretics may result in mineral, salt, or water imbalances. In addition, diuretics are sometimes associated with perturbations in carbohydrate and lipid metabolism. Diuretics and some beta adrenergic blockers are associated with unfavorable lipid profiles, which may explain the inability of some early clinical trials to show a significant decrease in the incidence of coronary artery disease among patients with mild hypertension taking these agents.[7] A reason for the rapid gain in popularity of ACE inhibitors and calcium channel blockers as first-line therapeutic agents is the relative lack of significant adverse reactions compared with previously developed antihypertensive agents.



Resistance to therapy is handled by increasing drug dosage, adding additional drugs to the regimen, or substituting different agents.[35] Refractory hypertension occurs when treatment with maximal doses of two appropriate antihypertensive agents, given adequate time to be effective, have not lowered pressure to an acceptable range. It can be due to secondary hypertension, exogenous factors such as sympathomimetic agents or steroids, or biologic factors such as obesity or excess sodium consumption. These potentiating factors must be eliminated or, at least, ameliorated.

Although ACE inhibitors and calcium channel blockers are first-line therapeutic agents, their use has been limited by the relatively high cost. This is a significant consideration. Fortunately, many pharmaceutical firms are addressing this problem, by offering special pricing programs for newer agents.

A neuropsychiatric program for HIV-infected individuals

Rif S. El-Mallakh, M.D.; Diane Okoneski, M.S.W.; Paul Schapiro, M.S.W.; and David J. Ligay, M.S.W.

Dr. El-Mallakh is director, Mood Disorders Research Programs, Department of Psychiatry and Behavioral Sciences, University of Louisville School of Medicine; and Ms. Okoneski, Mr. Schapiro, and Mr. Ligay are social workers in Prince George's County.

ABSTRACT: *Designing an effective, outpatient, community-based neuropsychiatric program for persons infected with human immunodeficiency virus-1 (HIV) is challenging because the affected population is diverse. The individuals must cope with a multitude of complications while anticipating a shortened life span. Behavioral and emotional complications are common and may be reactive, idiopathic, or organic. An effective program must provide neuropsychiatric evaluations and give access to ongoing supportive and psychotherapeutic services that take into account problems unique to HIV-infected individuals.*

Neuropsychiatric evaluations were performed on 80 infected patients. The HIV-seropositive individuals (n=60) were compared with patients with acquired immunodeficiency syndrome (AIDS) (n=20) using several clinical measures. Patients in the early stages of HIV infection suffered from more frequent major depressive episodes and ongoing substance abuse than patients with advanced disease. Cognitive impairment and psychosis, however, were primarily related to AIDS.

Despite the simplicity of the human immunodeficiency virus-1 (HIV) structure,[1] the mechanisms by which it produces disease remain enigmatic. This paradox is most apparent in the clinical effects of the virus on the brain, where it can enter cells that lack CD-4 membrane receptors[2,3] and cause severe neural dysfunction with negligible neuronal infections.[4,5] Psychiatric complications in HIV-infected individuals parallel this perplexing dimension of the virus. There may be organic manifestations of HIV-related neural dysfunction,[6–8] psychological reactions to the infection or its medical consequences,[9–11] or manifestations totally unrelated to viral infection.[12,13] This picture is further complicated by a quite diverse HIV-infected

population whose demographics continue to change.[14] In addition, high risk groups often have unusual social circumstances and psychiatric needs,[9,12,15] but regardless of their risk group, many of these individuals become socially ostracized, financially devastated, physically debilitated, and cognitively impaired. Death and dying have a significant impact on therapeutic compliance.[12,16] In the face of some of these overwhelming problems, people with acquired immunodeficiency syndrome (AIDS) commit suicide at rates 21 to 36 times that of the general population.[17,18]

Due to the scale and urgency of these patients' needs, and the rapidity with which the AIDS epidemic has spread, psychosocial research efforts have focused on the late stages of HIV disease and medically hospitalized inpatients. Relatively little work has been done on the provision of adequate psychiatric services for this population in outpatient, community-based settings. This paper describes an outpatient, community-based neuropsychiatric program, and presents experience with 80 patients.

Program description

The setting. Prince George's County is located in the south-central portion of Maryland, on the eastern and southern borders of Washington, DC. The 1991 population projection for the county was 729,268, making it one of the most heavily populated political jurisdictions in Maryland. The Prince George's County Health Department, both a state and county agency, functions as a major health care institution for Prince George's County residents, providing over 250,000 patient encounters annually. The Office on AIDS, established in 1987, is one of 10 major directorates in the health department.

The neuropsychiatric program, established in 1989, is rooted in the philosophy that an individual's mental health must be viewed within the overall context of biopsychosocial systems. Guided by this philosophy, it was decided to locate the neuropsychiatric program within the Office on AIDS rather than the Mental Health Clinic. This somewhat unusual step has been a vital factor in program effectiveness.

Neuropsychiatric evaluation and psychiatric services. The neuropsychiatric program comprises three major components: (1) initial and periodic follow-up evaluations; (2) acute and ongoing pharmacotherapy and psychotherapy; and (3) extensive support services.

Possible brain involvement by HIV makes a neuropsychiatric evaluation an essential component of the routine evaluation of HIV-seropositive individuals. Evaluation begins with a comprehensive medical, psychiatric, family, and social history. Particular emphasis is placed on symptoms of major psychiatric illnesses, substance use, adjustment to HIV and its medical complications, cognitive symptoms, and current functioning level. A mini-mental-state exam[19] is conducted, in addition to the routine mental status exam. If there is a possibility of HIV brain involvement, Trials A and B (which appear to be more sensitive in detecting HIV cognitive involvement[20]) and a brief neurologic examination are also conducted. Follow-up evaluations every 6–12 months monitor cognitive functioning and psychiatric symptomatology.

Both acute and ongoing therapy are provided when appropriate, including any combination of pharmacotherapy and individual, couples, family, or group psychotherapy. Psychotherapeutic and supportive services are available for severely debilitated, homebound patients. In addition, the clinic has a wide range of supportive services including support groups for individuals with HIV or with AIDS, for women, and for family members or significant others. We created separate groups because the literature indicates that the needs and issues of various HIV-infected populations are different and are best handled separately.[16,21] Additionally, case managers coordinate medical and psychiatric care and access to entitlement and social support programs.

Patient demographics. Currently, there are 776 active cases of AIDS in Prince George's County; 488 deaths have occurred. An estimated 4,600 county residents are infected with HIV. Of the nearly 200 patients served by the Office on AIDS in fiscal year 1991, 76% were African-American and 42% were women. Over 40% had acquired their infection via heterosexual contact. Although the majority were medically asymptomatic (67%), nearly 14% had AIDS.

Eighty individuals (59 men and 29 women) underwent neuropsychiatric evaluation. Mean age was 33.7 $\pm$ standard deviation (SD) 8.4 years. Twelve people (15%) had more than one risk factor for the acquisition of HIV. The distribution across the major risk groups was as follows: 40 patients with homosexual/bisexual contact; 39 patients with nonmonogamous heterosexual contact; 20 patients who used intravenous drugs and shared needles; and 5 patients who had received blood transfusions. The mean duration of time between initial documentation of HIV antibodies and undergoing neuropsychiatric evaluation was 16 $\pm$ SD 15.6 months.

Patients were evaluated routinely as part of their overall clinic evaluation (routine group), or as referrals for recognized psychosocial difficulties or complaints (indication group). While only 7 of the 47 (15%) routine-group patients had AIDS ($z=2.14$, $p=.016$), 13 of the 33 (40%) indication-group patients had AIDS. Overall, only 20 of the 80 patients in the combined groups (25%) had AIDS, while the remaining patients had non-AIDS HIV-related medical problems (n=7) or no medical symptoms (n=53).

Results

Patients with AIDS, expectedly, had a higher incidence of AIDS-related dementia or psychosis (**Table 1**). On the other

hand, patients with early HIV disease had more treatable psychopathology, specifically, major depression and active substance abuse (**Table 1**).

As a group, the 20 patients with AIDS had a significantly lower mini-mental-state score than patients with early HIV disease (**Figure 1**). All of the difference, however, was accounted for by the 10 patients with AIDS-related dementia, mania, or psychosis. When these patients were excluded from the analysis, cognitive function as measured by the mini-mental-state exam was not different (**Figure 2**), suggesting that **gross** cognitive deterioration occurs primarily in AIDS patients with extensive brain disease.

Patients in the indication group had an average of 1.4 psychiatric diagnoses per person (**Table 2**). This is significantly higher than the 0.94 diagnosis per person in the routine group (z=3.22, p=.0006) (**Table 2**). This difference was accounted for, in part, by a significantly higher rate of AIDS-related dementia (z=2.8, p=.0026)

Table 1. DSM-III-R psychiatric diagnoses in 80 patients evaluated routinely (n=47) or for a specific psychosocial complaint (n=33)*

Diagnosis	HIV + (n=60) (%)	AIDS (n=20) (%)	p
Substance abuse, active	14 (23.3)	2 (10)	0.13
Substance abuse, remission	16 (27)	5 (25)	ns
AIDS dementia**	3 (5)	7 (35)	<.008
Major depression	8 (14)	1 (5)	0.19
Adjustment disorder	18 (30)	6 (30)	
Dysthymia/cyclothymia	3 (5)	2 (5)	
Schizophrenia	3 (5)	1 (5)	
Other	2 (4)	0	
None	7 (12)	1 (5)	ns
Total	67	24	
Diagnoses/person	1.12	1.2	

(Individuals may have more than one diagnosis.)
**Not a DSM-III-R diagnosis; includes two cases of secondary mania and two cases of psychosis.*

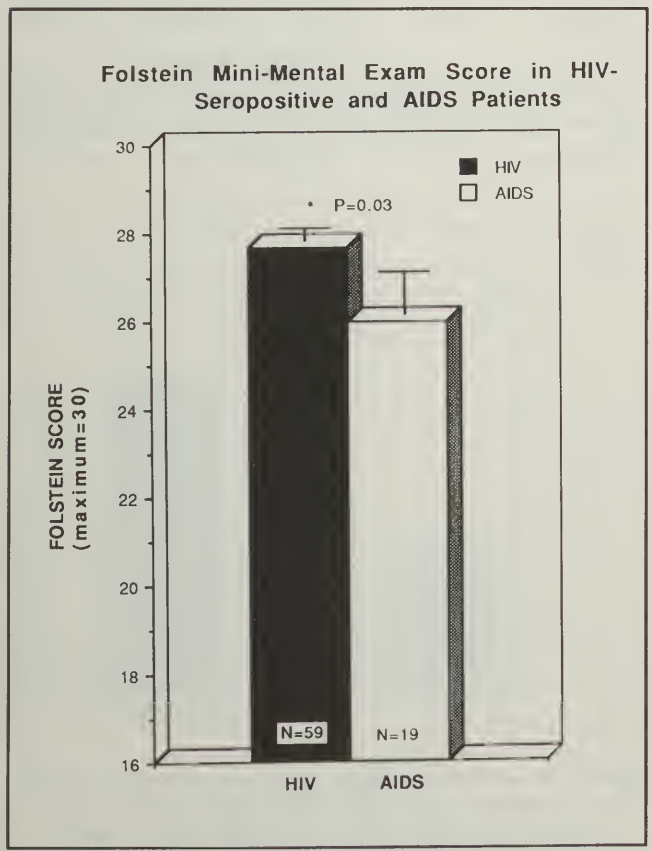

Figure 1. Patients with AIDS had significantly lower cognitive function scores as measured by the Folstein et al mini-mental-state exam.[19]

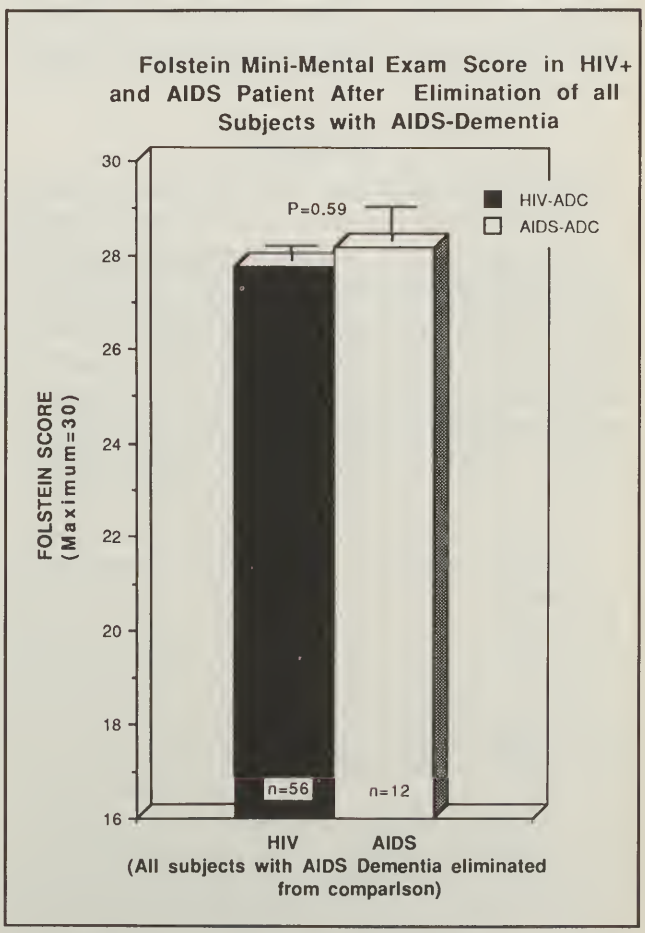

Figure 2. Excluding the 10 patients with dementia, psychosis, or mania, patients with HIV and AIDS are not different with respect to cognitive function scores as measured by the Folstein et al mini-mental-state exam.[19]

in the indication group. There was a trend for patients in the routine group to have resolved a substance abuse problem ($z=1.19$, $p=.12$) **(Table 2)**. Mini-mental-state exam scores did not differ significantly between indication-group and routine-group patients ($28.0 \pm$ standard error (SE) 0.34 vs $27.5 \pm$ SE 0.53, respectively, ns).

T-cell counts did not correlate with any of the psychiatric findings or clinical cognitive measures. T_4 cell counts, however, tended to decrease as a function of the duration of HIV infection **(Figure 3)** ($r=0.3, p<.8$). The same phenomenon was seen when T_4 cell counts were evaluated for each risk group **(Figure 4)**. Patients with heterosexually acquired HIV had the shortest duration of known HIV infection ($7.3 \pm$ SD 7.6 months, $p=.012$) and had significantly higher T_4 cell counts than either intravenous drug users ($p<.02$) or homosexual/bisexual men ($p<.001$) **(Figure 4)**. Patients with intravenous drug use or homosexual/bisexual lifestyles did not differ significantly in T_4 cell count **(Figure 4)** or duration of HIV infection ($21 \pm$ SD 15.4 months vs $18 \pm$ SD 18.0 months, respectively).

Table 2. DSM-III-R psychiatric diagnoses among 80 patients categorized by referral type*

Diagnosis	Indication group (n=33) (%)	Routine group (n=47) (%)	p
Substance abuse, active	8 (24)	8 (17)	ns
Substance abuse, remission	6 (18)	15 (32)	.12
AIDS dementia**	9 (27)	1 (2)	.0026
Major depression	6 (18)	3 (6)	.1
Adjustment disorder	11 (33)	13 (28)	ns

Schizophrenia	2 (6)	2 (4)	
Total	45	44	
Diagnoses/person	1.4	0.94	.0006

Individuals may have more than one diagnosis.
"Not a DSM-III-R diagnosis; includes four cases of secondary mania or psychosis.

Discussion

In our sample of 80 patients, gross cognitive deterioration rarely occurred in early HIV disease. Furthermore, the variance in cognitive function, as measured by the mini-mental-state exam, could be accounted for by the 10 patients with AIDS-related dementia, psychosis, or mania **(Figures 1 and 2)**. Although the mini-mental-state exam provides a somewhat crude measure of cognitive status, these results, in general, agree with studies using a variety of sensitive neuropsychological measures. These studies have found that cognitive dysfunction is uncommon in early HIV infection when the subjects are compared with the appropriate control group.[7,20,22-26]

It is not surprising that individuals referred for neuropsychiatric evaluation had more psychopathology than routinely evaluated patients. It is surprising, however, that routinely evaluated patients had a significant degree of psychopathology (an average of 0.94 per person, of which 0.62 diagnosis per person was an active problem) **(Table 2)**. Forty percent of psychiatric diagnoses were related to current or past substance abuse. This is higher than the 25% of the total population that had intrave-

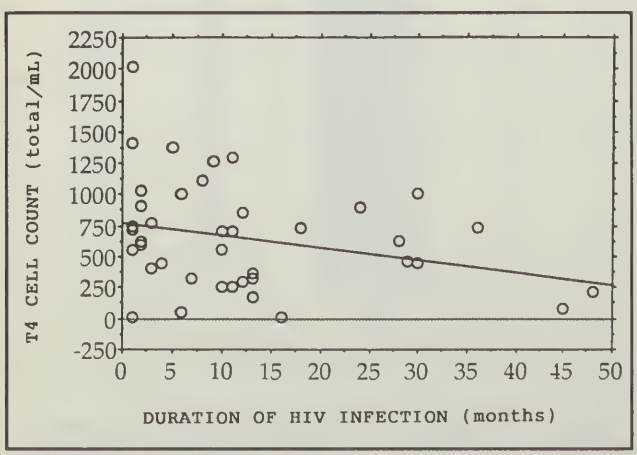

Figure 3. T_4 cell count decreases as a function of the duration of HIV infection ($r=0.3$, $p<.8$).

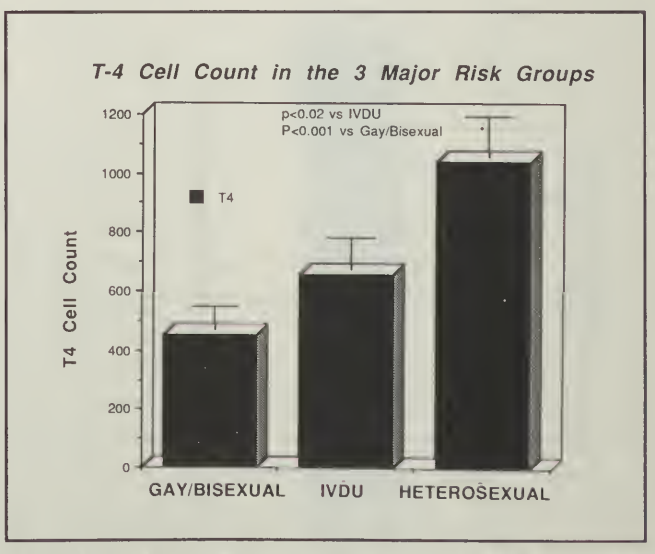

Figure 4. In our 80-patient sample, T_4 cell count is significantly higher in patients who acquired HIV by heterosexual contact. This is probably because the duration of HIV infection is shorter in this group (7 months vs > 18 months for both other groups, $p<.02$). (Homosexual/bisexual, n=34; intravenous drug users (IVDU) n=17; heterosexual, n=18).

nous substance use as a risk factor, and much higher than the National Institute for Mental Health Epidemiologic Catchment Area study rate of 3.8%. AIDS-related dementia, psychosis, and mania accounted for 11% of the total psychopathology in our study population. Other diagnoses that may have been related directly or indirectly to HIV, such as depression and adjustment disorder, accounted for 45% of the total psychiatric diagnosis.

Patients with early HIV disease had more frequent active substance abuse and major depressive disorders than patients with AIDS (**Table 1**), whereas patients with AIDS had a significantly greater rate of AIDS-related dementia, psychosis, and mania (**Table 1**). This suggests that there are more chances for positive therapeutic interventions in patients with early HIV disease.

The study findings are reminiscent of the report by O'Dowd et al.[27] Their experience in a university, consultation-liaison-based outpatient clinic, and our experience in a public, HIV/AIDS, community-based clinic, are strikingly similar. Both study populations contained similarly high proportions of women, minorities, and intravenous drug users. Invariably, and not surprisingly, the most common psychiatric problem seen in both studies was adjustment disorder occurring in conjunction with new seroconversion or new consequences of HIV infection. Both this study and that of O'Dowd et al[27] noted high rates of pre-seroconversion psychopathology. This was true in both the routine and indication populations, in which only 41% of the patients were evaluated for specific neuropsychiatric signs or symptoms, and in the O'Dowd population, in which all the patients were seen for specific psychosocial complaints.[27] The most frequent preexisting condition was substance abuse, a treatable but challenging condition. Finally, collective experience has shown that the more severely affected individuals, often those requiring medications, were the most likely to return and continue with treatment, while those actively abusing substances were the least likely to continue treatment.

In summary, our study suggests that patients with early HIV infection may have very high rates of psychosocial difficulties. A significant proportion of these problems may predate seroconversion; however, this was not directly examined in this study. Cognitive deterioration infrequently occurs in early HIV disease and appears to be closely related to severe brain dysfunction such as psychosis, mania, or dementia. HIV-infected individuals need a wide range of psychotherapeutic, evaluative, and supportive services to adequately address these issues. Our program may serve as a model for other HIV/AIDS clinics in the process of organizing neuropsychiatric services.
